STATE LIBRARY.

When, from whom, and how this volume was obtained,
with the price paid, if any, may be found opposite
the above number in the Register of Books,
which is always open to inspection.

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library
by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS
THEREOF, and by other State officers at any time.
SEC. 2298. The Controller, if notified by the Librarian
that any officer has failed to return books taken by him
within the time prescribed by the Rules, and after demand
made, must not draw his warrant for the salary of such
officer until the return is made, or three times the value
of the books, or of any injuries thereto, has been paid to
the Librarian.
SEC. 2299. Every person who injures or fails to return
any book taken is liable to the Librarian in three times
the value thereof.
No person shall take or detain from the General Library
more than two volumes at any one time, or for a longer
period than two weeks. BOOKS OF REFERENCE SHALL NOT
BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from
the Rules.]

43 The Foregoing Regulations will be strictly enforced. 63

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

Number 1.

Hanksite.

A New Anhydrous Sulphate Carbonate from San Bernardino County.

In the very complete and attractive exhibit of California minerals brought to the World's Industrial and Cotton Centennial Exposition at New Orleans, by Henry G. Hanks, State Mineralogist of California, were several species of unusual interest. Among these was the new borate, Colemanite, with its large and lustrous crystals so much resembling the finest of the Bergen Hill datolites; the new vanadium mica, Roscoelite, mixed as it is mechanically with much native gold between its folia; horax crystals, clear and bright, of unusual size; stibnite in superb crystals almost equalling the late discoveries in this species in Japan, and many others equally noteworthy.

Wm. Earl Hidden read before a recent meeting of the New York Academy of Sciences a paper on one of the minerals exhibited, and as it is of local as well as general interest, we reproduce the paper:

"Of particular interest to the writer was a small lot of apparently hexagonal crystals, to which had been given the name of 'Thenardite.' Now as Thenardite is asserted in the text books to be orthorhombic, I was prompted to measure the angles of these crystals. Their seeming non-conformity in shape pointed to the possibility of their being new—in angle, or type of form, especially. The results confirmed my first suspicions of their true hexagonal character, though my measurements were only approximate, being made with a hand goniometer."

Since the hexagonal character of the mineral, which seemed so evident, might possibly be due to complex twinning of orthorhombic individuals, it seemed advisable to have this question decided on the basis of an optical examination; and for this purpose three of the best crystals were kindly given by Prof. Hanks, and sent by me to Dr. Edward S. Dana for that exact crystallographic definition needed in this case, and which he always so ably and generously gives to science. The crystals sent being quite clear, Dr. Dana was, in a few days, enabled to report them "as uniaxial (double refraction negative), and that normally," and thus their positive difference from Thenardite was proven beyond question. They were true hexagonal crystals. Believing now the mineral to be either a dimorphous form of sodium sulphate, or possibly an entirely new species, an analysis seemed necessary. Accordingly I placed sufficient material in the hands of Mr. James B. Mackintosh, E. M., for that purpose, and he has kindly done the work. His results showed the mineral to contain the following substances:

SO ₃	45.89
CO ₂	5.42
Cl.....	2.36
%Na ₂ O.....	46.34

Corresponding to

Na ₂ SO ₄	81.45
Na ₂ CO ₃	13.06
Na Cl.....	3.80
Na ₂ O (excess).....	1.08
	99.48

\$All bases calculated as soda. Lime and magnesia were not present.

These results give the following molecular ratios for

Na ₂ SO ₄	57.3	(3.95)
Na ₂ CO ₃	14.5	(1.00)
Na Cl.....	6.65	(.46)
Na ₂ O.....	1.74	(.12)

Or closely in the ratio of 4 : 1 : $\frac{1}{2}$: $\frac{1}{4}$. This all points to the formula,

as representing the composition of the crystals under examination. Or, neglecting the sodium chloride as non-essential, the formula could be given thus:—

which is probably the true one.

The observed excess of soda is either due to

Fig. 1.

CRYSTALS OF HANKSITE.

errors of analysis, as only a small quantity was used, or it may have been combined with boracic acid, as borax is very abundant at the locality.

The interesting anomaly of a sulphate and carbonate being in chemical combination re-

from several localities in the far West, groups of crystals that were hexagonal (tabular) in appearance, very impure in composition, and to which the name of Aragonite has been attached.

The crystals here analyzed were found with aalt, thenardite, tincal, etc., at the works of

Fig. 2.

GROUPED CRYSTALS.

the San Bernardino Borax Co., in San Bernardino county, California.

The density of this new California mineral is 2.562. Its hardness, 3–3.5. It is readily soluble in water. Effervesces with acids. It affords, when dissolved in water, an abundant

ROESSLER'S APPARATUS FOR MAKING SULPHURIC ACID.

minds us of the rare sulphate carbonate of lead, Leadhillite, to which this alone bears relation as a natural species.

The angles I obtained were as follows:—

O on 1 = 90°	O on 1 = 126° 30'
I on 1 = 120°	O on 2 = 113° 30'

Accordingly the value of the vertical axis is 1.17085. Cleavage parallel to O nearly perfect, but difficult to obtain.

Crystals striated horizontally. They are commonly terminated at both ends of the prism, and are very symmetrical in shape. They average, as thus far seen, about one centimeter in length and thickness, with O and I as predominating planes.

Sometimes the crystals are confusedly grouped (see Fig. 1), as from a common centre, much like the Aragonite from a noted European locality. For some late years mineralogists have received

precipitate of barium sulphate when barium chloride is added to the solution. On addition of silver nitrate, to a fresh solution, chloride of silver is precipitated, showing that chlorine is also present. Gentle ignition develops no appreciable loss in the weight of the mineral.

The crystals are transparent to semi-opaque, with a white waxy color inclining to yellow. Surfaces very highly polished or very smooth.

The definite formula deduced from Mr. Mackintosh's analysis, taken together with the form, warrants me in announcing these crystals as a new mineral species. I therefore propose for it the name of Hanksite, after Prof. Henry G. Hanks, of California, than whom no man has done more to give to the world a correct knowledge of the minerals of the great States of our Pacific Coast.

Sulphuric Acid and Sulphate of Copper.

By the discharge into the air of sulphurous and sulphuric acid vapors, or the process of parting bullion by sulphuric acid, a nuisance is created. During certain experiments and researches by Dr. Heinrich Roessler, chief of the German gold and silver parting establishment at Frankfurt-on-the-Main, for the sole purpose of abating such a nuisance, certain results were achieved which have an important bearing not only on this process, but are of value in the manufacture of sulphuric acid and sulphate of copper from sulphurous gases derived from any source. Roessler's method is now in successful operation at several places abroad, including the Royal mints of Kremuetz and Munich.

Mr. Arthur F. Wendt, of New York, has described the Roessler process of manufacturing sulphuric acid and sulphate of copper before the American Institute of Mining Engineers. The process, briefly described, is the introduction of sulphurous gases, mixed with an acid steam in a finely divided state, into a solution of blue vitriol. The salt acts as the carrier of the oxygen of the air, continuously converting sulphurous into sulphuric acid. It replaces the nitric acid of the lead chambers.

Laboratory experiments readily show the reactions occurring. If sulphurous acid is allowed to pass through a hot and not too acid solution of blue vitriol in such manner as to keep the liquid in violent ebullition, it will rapidly change the bright blue color of the solution to a dirty green. An addition of water to the green liquid will precipitate metallic copper. Salt will precipitate such chloride of copper. These reactions are proofs of the reduction of a portion of the sulphate of copper by the sulphurous acid into a sulphate of the suboxide, which remains dissolved in the hot solution of blue vitriol. To the presence of the suboxide is due the change in color.

If, now, air is blown into the dirty green solution, the bright blue color is gradually restored, owing to the re-oxidation of the green sulphate of the suboxide in the blue sulphate of the pro-oxide, the blue vitriol of commerce. The reactions of reduction and oxidation go on indefinitely and practically simultaneously in the apparatus devised by Dr. Roessler.

A sketch of the apparatus is here shown. A leaden tank (B), some eight or nine feet in diameter, carries a 6 inch lead pipe (A), branching at the bottom and supporting a ring (C), with numerous small holes drilled on the lower side. A Korting steam injector draws the gases containing the sulphurous acid from the flue (D), and forces them through the blue vitriol, which partly fills the tank or converter.

From 80 to 90 per cent of the sulphurous acid is converted into sulphuric acid, and any free sulphuric acid that may be present in the gases forced through the converter is completely absorbed by being brought into intimate contact with the water. The acid generated in the converter reaches a strength of 15° to 20° B.

By preference, the converter is now employed in Europe to manufacture blue vitriol. Sulphurous acid gas generated in metallurgical or other commercial operations invariably contains a small percentage of sulphuric acid, formed either by oxidation of sulphurous acid by the oxygen of the air, or carried along mechanically, as is the case with gases derived

(Concluded on page 5.)

Mineral Products of the United States.

The Yield in 1884.

The second report on "The Mineral Resources of the United States," by Albert Williams, Jr., Chief of the Division of Mining Statistics and Technology, United States Geological Survey, is now in press and will be issued shortly. This report is for the calendar years 1883 and 1884, and contains detailed statistics for these periods, and also for preceding years, together with much descriptive and technical matter. The following are the totals of the production of the more important mineral substances in 1884:

Coal.—The only statistics in which the trade is interested are those relating to the amount of coal which is mined for and reaches the market. There is besides a local and colliery consumption which is usually disregarded in statistics, and which ranges from five to six and a half per cent of the total shipments. Of what may be called the commercial product the quantities in 1884 were as follows: Pennsylvania anthracite, 30,718,293 long tons; bituminous and brown coal, lignite, and small lots of anthracite mined elsewhere than in Pennsylvania, 66,875,772 long tons; total, 97,594,065 long tons. The spot value of the commercial product was: Pennsylvania anthracite, \$61,436,586; bituminous and all other coals, \$70,219,561; total, \$131,656,147. Including the local consumption, etc., the total product in 1884 may be stated at 106,906,295 long tons; namely, 33,175,756 long tons of Pennsylvania anthracite and 73,730,539 long tons of bituminous and all other coals; and the value at the mines was: Pennsylvania anthracite, \$66,351,512; bituminous and all other coals, \$77,417,066; total, \$143,768,578. The total production (that is, including colliery and local consumption) of anthracite was 1,160,713 long tons less than in 1883, while its value was \$10,905,543 less, the disproportionate decline in value being due to a fall of 25 cents per ton in spot price (\$2.25 to \$2). The total bituminous coal production increased 5,199,039 long tons over that of 1883; but its value was \$4,820,734 less, the average valuation at the collieries having fallen from \$1.20 to \$1.05. The total output of the coals showed a net gain in tonnage of 4,038,326 long tons and a decline in value of \$15,726,277.

Coke.—There were 4,873,805 tons of coke made in 1884, worth \$7,242,878 at the ovens. This production consumed 7,951,974 short tons of coal. The amount of coke made was 590,916 tons less than in 1883, and the value was \$878,729 less.

Petroleum.—The production of crude petroleum in 1884 was 24,089,758 barrels of 42 barrels each, of which the Pennsylvania and New York oil fields produced 23,622,758. The total value, at an average spot price of 85 cents, was \$20,476,204. As compared with 1883 the production was 689,529 barrels greater; but the total value was \$3,263,958 less, the average spot price having fallen from \$1.10, or 25 cents per barrel.

Natural gas.—The estimated value of the natural gas used in the United States in 1884 was \$1,460,000, as against \$475,000 in 1883. The value is computed from that of the coal superseded by natural gas.

Iron.—The principal statistics for 1884 are as follows: Iron ore mined, 8,200,000 long tons; value at mine, \$22,550,000. Domestic iron ore consumed, 7,718,129 long tons; value at mine, \$21,224,854. Imported iron ore consumed, 487,820 long tons; total iron ore consumed, 8,125,949 long tons. Pig iron made, 4,097,868 long tons, a decrease of 497,642 tons as compared with 1883; value at furnace, \$73,761,624, or \$18,148,576 less than in 1883. Total spot value of all iron and steel in the first stage of manufacture, excluding all duplications, \$107,000,000, a decline of \$35,000,000 from 1883. Fuel consumed in all iron and steel works, including blast furnaces, 1,973,305 long tons of anthracite, 4,226,986 long tons of bituminous coal, 3,833,170 long tons of coke, and 62,110,660 bushels of charcoal, besides a notable quantity of natural gas. Limestone used as flux, 3,401,930 long tons; value at quarry, \$1,700,965.

Gold and silver.—The mint authorities estimate the production in 1884 at \$30,800,000 gold and \$48,800,000 silver (coining rates); total, \$79,600,000. This was an increase of \$800,000 gold and \$2,600,000 silver, as compared with 1883. The gold production was equivalent to 1,489,949 troy ounces; and the silver to 37,744,605 troy ounces.

Copper.—The production in 1884, including 2,858,754 pounds made from imported pyrites, was 145,221,934 pounds, worth \$17,789,687, at an average price of 12½ cents per pound in New York City. The amount was 28,070,139 pounds greater than this production of 1883; but the value was \$275,120 less than that for 1883, owing to the decline in price. In 1884 4,224,000 pounds of bluestone (sulphate of copper, "blue vitriol") were made; worth, at 4.3 cents per pound, \$181,632.

Lead.—Production, 139,897 short tons. Total value, at an average price of \$75.32 per ton on the Atlantic sea board, \$10,537,042. The production was 4,060 tons less than that of 1883, while the decrease in value was \$1,785,677. The production of white lead (carbonate) is estimated at about 65,000 short tons, worth at 4½ cents per pound, \$6,337,500, almost all of which was made from pig lead. The produc-

tion of litharge and red lead has not been ascertained.

Zinc.—Production of metallic zinc, 38,544 short tons; worth, at an average price of 4.44 cents per pound in New York city, \$3,422,707. The output was 1,672 tons greater than in 1883, and the value increased \$111,601. Besides the spelter and sheet zinc, about 13,000 short tons of zinc white (oxide) were made directly from the ore, the total value of which, at 3½ cents per pound, was \$910,000.

Quicksilver.—Production, 31,913 flasks (of 76½ pounds net=2,441,344 pounds), or 14,812 flasks less than in 1883. Total value, at an average price of \$29.34 per flask at San Francisco, \$936,327, a decline of \$317,305 as compared with the total value of the product of the previous year. During the year 600,000 pounds of quicksilver vermilion were made, worth \$288,000.

Nickel.—Production of nickel contained in copper-nickel alloy, 64,550 pounds, worth, at 75 cents per pound, \$48,412; an increase of 5,750 pounds, but a decline of \$4,508 in total value, owing to the falling off in price.

Cobalt.—The amount of cobalt oxide made in 1884 was about 2,000 pounds, as against 1,096 pounds made in 1883. Its value, at \$2.55 per pound, was \$5,100. The value of cobalt ore and matte cannot be ascertained, as it is chiefly dependent on the nickel contents.

Manganese.—The output of manganese ore in 1884 was about 10,000 long tons, or 2,000 tons more than in 1883. The total value, at \$12 per ton at the mines, was \$120,000, or about the same as in 1883, the average price having declined \$3 per ton.

Chromium.—This production of chrome iron ore, all from California, was about 2,000 long tons, or about two-thirds as much as in 1883. At an average value of \$17.50 per ton at San Francisco, the total value was \$35,000.

Tin.—A little tin ore was taken out in the course of development work in Dakota, Wyoming, Virginia and Alabama, but the only metallic tin made was a few hundred pounds from ore of the Black Hills (Dakota), mines made in sample tests at New York City pending the building of reduction works at the mines.

Platinum.—The amount mined in 1884 was about 150 troy ounces, worth, crude, \$3 per ounce.

Aluminum.—The amount made in the United States in 1884 was 1,800 troy ounces, an increase of 800 ounces over the production of 1883. At 75 cents per ounce the total value was \$1,350.

Building stone.—It is estimated that the value of the building stone quarried in 1884 was \$19,000,000, as against \$20,000,000 in 1883; the decline being due partly to dullness of trade and partly to the increased use of other structural materials.

Brick and tile.—The output was about the same as in 1883, but as manufacturers cut down expenses still further, meeting a lower market, the total value is estimated at \$30,000,000 as against \$34,000,000 in 1883.

Lime.—There were 37,000,000 barrels (of 200 pounds) made in 1884, the average value per barrel at the kilns being not over 50 cents, or \$18,500,000. The production was about 5,000,000 barrels greater than in 1883, but owing to the fall in price the total value was about \$700,000 less.

Cement.—About 100,000 barrels (of 400 pounds) of artificial Portland cement were made, or 10,000 more than in 1883; the total value, at \$2.10 per barrel, being \$210,000. The production of cement from natural cement rock was 3,900,000 barrels (of 300 pounds), or 200,000 barrels less than in 1883; worth, at 90 cents per barrel, \$3,510,000. The total production of all kinds of cement was about 4,000,000 barrels, valued at \$3,720,000.

Precious stones.—The estimated value of American precious stones sold as specimens and souvenirs in 1884 was \$54,325, and the value of the stones sold to be cut into gems was \$28,650; total, \$82,975. About \$140,000 worth of gold quartz was saved as specimens or made into jewelry and ornaments.

Buhrstones.—The value of the buhrstones yearly made in the United States is about \$300,000.

Grindstones.—Dealers estimate the value of the grindstones made in 1884, at \$570,000.

Phosphates.—The production of washed phosphate rock in South Carolina during the year ending May 31, 1884, was 431,779 long tons, worth \$2,374,784, or 53,399 tons more than in the previous year, with an increase of \$104,504 in value. The average spot price, \$5.50 per ton, was 50 cents less than in the preceding year. The recent discoveries of phosphate rock in the adjoining States of North Carolina, Alabama, and Florida will probably lead to a still further increase in production. Of manufactured fertilizers, 967,000 short tons, worth \$26,110,000, were made in the year ending April 30, 1884, and 1,023,500 short tons, worth \$27,640,000, were made in the year ending April 30, 1885.

Marls.—In New Jersey about 875,000 tons, worth \$437,500 at the pits, were dug in 1884. In addition, small quantities were produced for local use in some of the Southern States. The production is declining, owing to competition with fertilizers made from phosphatic rock, etc.

Gypsum.—In the Atlantic States, from Maine to Virginia, 65,000 long tons of land plaster and 60,000 tons of stucco, total 125,000 tons, were made in 1884, of which nearly all was from Nova Scotia gypsum. The statistics for Michigan have not been reported, but the produc-

tion did not vary greatly from that in 1883, in which year it was 60,082 short tons of land plaster and 159,100 barrels (of 300 pounds) of stucco. In Ohio 4,217 short tons of land plaster and 20,307 barrels of stucco were produced. There was also a small production in other parts of the country; but the total amount of domestic gypsum used is not known.

Salt.—The production in 1884 was 6,514,937 barrels of 280 pounds (equivalent to 1,824,182,360 pounds, or 32,574,655 bushels, or 912,091 short tons, according to the unit used). The total value, computed on average wholesale prices at the point of production, was \$4,197,734. The apparent output was 322,706 barrels greater than in 1883, while the value was \$13,308 less; but the production figures do not include a considerable stock on hand in the Onondaga district, not officially reported because not inspected.

Bromine.—The production is estimated at 281,100 pounds, all from the Ohio and West Virginia salt district; worth, at 24 cents per pound, \$67,464.

Borax.—Production about 7,000,000 pounds, or 500,000 pounds more than in 1883. The total value, however, was less than that of the product of 1883, being about \$490,000 at San Francisco rates, as against \$585,000 in 1883.

Sulphur.—No exact statistics. This production was only about 500 tons, worth about \$12,000.

Pyrites.—About 35,000 long tons were mined in the United States, worth about \$175,000 at the mines. Some 33,500 tons of imported pyrites were also burned, making a total consumption of 68,500 tons.

Barytes.—Full statistics not received. The production is estimated to have been about 25,000 tons; worth, at \$4 per ton, unground, at the point of production, \$100,000.

Mica.—The production of merchantable sheet mica, not including mica waste, was 147,410 pounds, valued at \$368,525.

Feldspar.—The production was 10,900 long tons, or 3,200 tons less than in 1883. Its value at the quarries was \$55,112.

Asbestos.—The amount mined was about 1,000 short tons, worth about \$30,000.

Graphite.—Production nominal, the supply being drawn from the stock accumulated in 1883.

Asphaltum.—The annual production is about 3,000 tons, having a spot value of \$10,500.

Alum.—About 38,000,000 pounds were made in the United States in 1884, or 3,000,000 pounds more than in 1883. At an average spot value of one and seven-eighths cents per pound, the product was worth \$712,500.

Copperas.—The amount made in 1884 was 15,500,000 pounds, worth, at 60 cents per hundredweight, \$93,000.

Mineral waters.—The sales of natural mineral waters in 1884 amounted to 68,720,936 gallons, valued at \$1,665,490, an apparent increase of 21,431,193 gallons and \$236,007 upon the figures for 1883. While the sales are undoubtedly increasing it is possible that the excess in the reported quantity and value of the waters sold in 1884 as compared with 1883 may be partly due to the greater fullness of the returns for 1884. Besides the waters bottled and placed on the market there is a large local consumption, not included in the foregoing figures.

REDUCTION WORKS.—Custom reduction works are badly needed in Belmont so that chloriders could get their ore worked at a reasonable figure. No chlorider can pay \$35 a ton for milling, \$20 freight and 20 per cent discount on silver out of \$100 ore when it is only worked up to 80 per cent of its assay value. The chlorider is the worst handicapped man in the United States. All things considered, it is no surprise that so little chloriding is done when the inducements offered are so thin. Can any man mine and live when he can only get \$5 out of \$100 rock. Would it not prove a profitable investment for the business men of Nye county to form a joint stock company for the purpose of reducing custom ores and fix things so that a miner could have ore that would work \$100, reduced at a rate that would leave him sufficient to live on. We never will have a prosperous county till something of this kind is done. It is poor policy to help crush our only industry by making exorbitant charges for milling and supplies and then lay back and bellyache that the paying of \$4 a day is the cause of closing down of the mines and reduction works. Would there be any more mines working were the wages 50 cents per day less. We think not. Inducements will have to be held out to men to mine before we can hope for more prosperous times, and we will have to stir ourselves to help make them instead of sitting Micawher like waiting for something to turn up. Custom reduction works are needed, and the sooner our mining men see that this want is attended to the sooner will the complaint of hard times cease to be heard. We must have reduction works at home to handle custom ores at reasonable rates ere we can hope for a prosperous permanent camp.—Belmont Courier.

ACCORDING to the Assessor of Storey county, Yellow Jacket, for the quarter ending March 31, 1885, yielded 15,412 tons of ore which milled \$15.20 per ton; Kentucky, 2,755 tons, milling at \$15.32 and yielding \$41,535.87 in bullion; Crown Point, 19,990 tons, milling \$12.88 and yielding \$302,837.47, and Belcher 12,315 tons, milling at \$12.54 and yielding \$154,021.30.

Helena District.

A Promising Montana Region.

A reporter of the *Helena Independent* has been visiting the mines of Helena District, and from his report we make the following extracts:

Men are seen working on the various prominent lodes, while many are seen scattered about the hills in the vicinity, with picks, shovels and other mining tools, endeavoring to make new discoveries. From present indications, we do not consider that we are amiss in estimating that in less than three months the new lode will have a population of fully 500. It is a beautiful location, and its surroundings are magnificent. Helena is in plain sight and the view obtained of the valley and mountains surrounding is simply grand. It is but about two miles from the railroad track, and that in a short time a branch will be run right to the mines is beyond question.

The first mine visited was the celebrated Helena mine, the one that has given this district the fame that it now possesses. This lode has two shafts sunk upon it, one an incline following down the lode to a depth of 106 feet, and the other is vertical and a depth of 117 feet has been attained. The two shafts are 150 feet apart and a drift is now being run from the incline to the vertical shaft with a view of having good air in the mine as soon as they are connected. The drift has already been run 70 feet in length. In the drift a solid body of ore from eight to nine feet is shown up that is proving to be immensely rich. In the incline shaft ore was found in large paying quantities from the top to the bottom. A level has also been run south 30 feet that shows up the same class of ore that is shown in this north drift. Notwithstanding that this mine has already shipped large quantities of high grade ores there is now on the dump and being prepared for shipment over 200 tons of ore that will yield thousands of dollars. A large amount of lower grade ore is also on the dump and will be held until reduction works can be erected, when, it is said, it will all pay handsomely.

Forty-two men are now regularly employed in working, both day and night, and development is progressing very rapidly. Ores are hoisted by a "whip," operated by horses. It is the intention of the company within a short time to put in steam hoisting works.

The next place visited was the Christmas Gift lode, the property of Mr. J. H. Sperling. It is an extension of the Helena, and although its development is not so extensive as that of the Helena, its showing is fully as good. Twelve openings have been made upon the lode. It is the intention of the owner to follow the ledge on an incline to a depth of 80 feet, and then to commence the running of levels. Something wonderful and very unusual is the fact that the sinking of this shaft has produced ore that has brought him in considerably more money than the expense of sinking it, which is considerable, taking into consideration that miners do not usually expect to be recompensed for sinking, anything near what it costs. Considerable ore is on the dump and Mr. Sperling informed us that he is now making preparations for the shipment of two carloads of the higher grade ores to the Wickes smelter. A large quantity of the lower grade will be brought to this city for the purpose of being worked by the Esler concentrator.

The Grass Valley lode, owned by La Rue, Blackburn, Patterson and others, was early in the spring handed to Messrs. Ray and Cleveland, and recently rebonded to Mr. C. D. McClure, a prominent mining man and one of the owners of the celebrated Granite Mountain lode, who we are really informed, will in a short time take up the bond. The ore is proving to be very rich and the indications are that this mine is just as rich as any other in the vicinity.

The Good Luck lode owned by Mr. J. H. Sperling, but recently bonded by Mr. J. W. Rasket, of the Helena Mining and Reduction Works, is a lode that was located some eight or ten years ago and abandoned. It was relocated in February last by Mr. Sperling, and a shaft 75 feet was immediately sunk upon it, and some first-class ore was thrown in sight. There is no doubt but that the bond will be lifted. The Syndicate lode is another owned by Mr. Sperling, and bonded to Mr. Rasket. The main shaft is 46 feet deep, and shows a 6-foot body of ore that will pay well. Three other shafts of a less depth are upon the lode, and show prospects equally as good.

Mines in every direction were pointed out and we were informed that many locations within a radius of over five miles have recently been made.

These ores in this district seem to bear principally silver, gold and galena, most of which is free milling ore. It is of a gray and yellow carbonate character and very easily taken out. The class of ore obtained indicates that there is plenty more where it came from, as do the mines of Colorado, which are taking out the same kind of stuff.

These mines are desirably located and easily accessible, either for a good wagon road or for a railroad; also for the erection of a mill, concentrators, reduction works, smelters, etc. With so much good ore in sight and the necessary facilities for speedy returns, we don't see why this should not be made one of the most prominent mining camps in the west.

THERE are 3,800,000 tons of tailings in Storey county, Nev., that will assay \$4.50 per ton, representing a total value of \$17,000,000.

MECHANICAL PROGRESS.

"Burnt Iron."

Of the many problems relating to iron which, it appears to me, require further investigation, says Dr. John Percy, is the old one of "burnt iron." It would be superfluous and impertinent to obtrude any definition of that expression. Every blacksmith, as well as every forge and mill man, has good reason to regret his practical acquaintance with it, and the trouble in dealing with it. The cause which produces it is well known—over-heating—but not the precise nature of the change which is thereby effected.

Although much has been written and published on the subject of this change, yet I venture to submit that it has not been satisfactorily elucidated, diverse opinions being still held regarding it. It is believed, on the one hand, to be exclusively physical, and to consist of a larger development of crystalline structure; and, on the other hand, to be physico-chemical, and to consist of such structural modification, accompanied with the partial, if not complete, abstraction of carbon, or of the absorption of oxygen. It should be borne in mind that I am not now speaking of "burnt steel," the theory of the production of which seems to have been well established. Malleable iron, I may remind you, even of the most fibrous character, may be made to acquire a largely crystalline structure—by which I mean converted into crystals individually of large size—either by fusion, by heating it only for a very short time to a high temperature approaching, yet sensibly below, its melting point, or by long-continued exposure to a much lower temperature.

The second of these conditions is that which usually causes the "burning" of iron; and zinc also when rolled out into sheet, and heated only for a second or two to a temperature bordering on its melting point, furnishes an excellent illustration of a similar change of structure. Before heating, it may be bent backwards and forwards several times without breaking, and the act of bending is not accompanied with the slightest sound; but, after heating and cooling, whether rapidly or slowly, it makes no difference, it is so brittle that it breaks instantly, and the act of bending is accompanied with a very audible harsh grating sound. The fracture in this case is largely crystalline comparatively speaking, and indicates clearly that the heating of the sheet, though only momentarily, has sufficed to enable the molecules of the metal to rearrange themselves in the manner which I have stated.

I have noticed that quite recently these facts relating to zinc have been described as novel, whereas they have been long known, and I certainly published them more than twenty years ago; but they were probably well known, if not actually published, long previously. Now, I apprehend that, with respect to modification of structure, what takes place in the "burning" of iron (which has a high melting point) at a high temperature, takes place equally at a low temperature in the case of zinc, which has a comparatively low melting point. Moreover, as "burnt iron" may be what is called "coaxing" he forged, so the brittle "burnt zinc" may, when heated to a temperature at which the cast metal becomes malleable and ductile, be again passed through the rolls without cracking.

With respect to the chemical changes which have been alleged to occur in the "burning" of iron, I take the liberty of expressing my own opinion, which is that the experimental evidence hitherto published on the subject cannot be regarded as conclusive. It is for this reason that I have ventured to bring it before you, in the hope that it may attract attention from some of the many skillful chemical analysts at our iron and steel works, and induce them to attempt the solution of it. The point which I would particularly suggest for their investigation is the alleged absorption of oxygen by iron at a high temperature, with, of course, the formation of oxide and its solution in, or diffusion through, the mass. Here, obviously, there could be no case of occlusion of oxygen, unless the temperature were high enough to cause the dissociation of oxide of iron. The effervescence, following the addition of spiegeleisen to molten decarburized pig iron, has been adduced as proof of the existence of oxygen in some state or other in the metallic bath; and experiments on the small scale have seemed to indicate that molten malleable iron may, like molten copper, dissolve some of its own oxide. But what is now wanted is conclusive evidence on such interesting points, evidence founded on the sure basis of accurate observation and careful experiment.

Some persons may, however, possibly ask to what useful practical results is the investigation of such questions likely to lead? The answer is that many an apparently sterile fact in science has been unexpectedly found to admit of practical application, with the result of benefiting the world and enriching not the man who discovered the fact, but the man who was fortunate enough to apply it.

Who can tell that it may not so happen with respect to the investigation of "burnt iron," though I must confess, it seems very improbable. The effect produced on iron by frequently reheating it to a high temperature, say a welding heat, is, if I mistake not, generally considered to have been long ago conclusively demonstrated. By such treatment iron is said to be

injured in quality; by which, I apprehend, is chiefly meant reduced in tensile strength. Now, I received some years ago, from my friend Col. Dyer, of the Royal Artillery, a report of a series of experiments which were made under his direction at the Arsenal, Woolwich, and which do not confirm the prevailing opinion on this subject. The report contains full and precise details of these experiments which might be communicated to the institute in a paper but not fittingly in a presidential address. Suffice it to say, the result showed that iron might be heated four times, for about three hours each time, to a welding heat, being allowed to cool without hammering after each heating, without injuring its quality in the least degree. The special object of these experiments was to ascertain whether the internal portion of the large gun forgings would be likely to be injured by repeated reheatings to a welding heat, though well-hammered each time on the exterior.

Soldering in the Machine Shop.

The American *Machinist* gives some hints on soldering in the machine shop, from which we condense: Soldering in a machine shop is very different from such work as usually done in a tin shop. The soldering irons, or "coppers" as they should be called, are generally more or less out of order—a stout, dirty point, covered with dross and ashes. Then his work is not usually well prepared, and the result is too often too much solder, no solder, a streak of rosin and a patch of dirt. The "coppers" should be taken to a vise and filed into shape generally about 60°, but for special jobs the angle may be raised.

The forge is a poor place in which to heat the "coppers," especially unless charcoal is used. The sulphur from soft coal will take the tin from your "coppers" faster than you can put it on. Care must be taken in getting just the right heat. Rubbing on a wet rag will remove the ashes, and an experienced tinker will tell him when the heat is right.

Make a machinist understand that soldering is nothing but welding, and he will do twice as well at it. He would not expect to make a good job welding a 2" shaft without flux, and with a 1-16" of rust between the pieces, yet he often tries to make solder run over dirty, rusty tin without any flux but grease and ashes.

See that the parts are clean and bright. If tin or brass, use rosin; if copper, sal-ammoniac; if iron use muriate of zinc, made by putting strips of sheet zinc into muriatic or hydrochloric acid until it will cut (dissolve) no more. The zinc is deposited upon the iron, forming, as far as soldering is concerned, a surface of zinc to work upon, and rosin should be used to protect the hot solder from the air. Large pieces of metal should be warmed before trying to solder them. Cast iron can be tinned by the acid and soldered perfectly.

The machinist finds that with our clean, well-tinned irons and bright working surfaces he can draw the solder just where he wants it. It will follow the hot copper just as iron filings follow a magnet, and the work looks smooth, bright and clean. No lumps there; no alternate lumps of solder and patches of dirt are there to spoil his work.

Tallow is the proper flux for lead, but rosin can be used and will do a good job. Another point to look sharp after is the quality of the solder. Don't try to use poor lead, although the Chinese tea-lead contains so much tin that it will work very well. Good solder should be made of two parts tin and one part pure lead. Plumbers' solder for wiping up joints works best when reversed, viz., one part tin to two of lead.

Soldering Block Tin.

Did a poor machinist ever so far forget himself as to try to solder a block tin or Britannia teapot which had a hole melted through the side thereof, then that machinist got himself into business right off. Tin melts at 446 degrees, Fahr., and his solder melts 340 degrees. His soldering copper is anywhere from 400 to 300 degrees, and while he is trying to patch up one side of the hole, he melts half an inch from the other side. He does this two or three times; the teapot goes under the stairs, and the machinist takes a double chew of tobacco to soothe his rising temper.

The next time he tries the job he will fill the teapot with damp molding-sand, smooth it off the shape of the pot, mix two parts of bismuth with his solder, and it will melt at 236 degrees; and he can use an iron much cooler than is required with the common solder. The hole can be melted full of solder, smoothed off, furnished, and Mr. Machinist can dig out the sand, show the job to "the boys," and carry it home in triumph.

A NEW STEEL-MAKING PROCESS is about to be tried by the proprietors of rolling mills throughout the Mahoning Valley, Pa., who are alleged to be quietly engaged in securing estimates as to the probable cost of adopting steel plants. A gentleman, whose name is withheld, asserts that he has invented a process for making steel that lays all others in the shade, as the cost is a mere trifle. Mr. George Summers, of Summers Bros. & Co., at Struthers, after an investigation, has decided to erect a building near his mill, where the inventor will make practical demonstration of his invention. Should it prove what is claimed for it, the process will, it is believed, at once be introduced in all the mills.

SCIENTIFIC PROGRESS.

An Interview with Edison—A New Force.

A New York interviewer recently paid a visit to the work shop of Mr. Edison, and among other things gives the following: Perhaps the most interesting thing he had to say was respecting his exploration for a "new force." At present he calls it simply x y z. He does not pretend to know what it is. He says that there are many phenomena which are not explained by any force yet recognized, and it is these which he is going to investigate. Vibrations of matter at the rate of 30,000 a second produce the highest sound we can hear. Between these and the vibrations which, at the rate of millions per second, cause the sensation of heat, there is a large gap; and between these and the vibrations which give the sensation of color there is another gap. These gaps, Edison believes, are filled by vibrations as yet unmeasured, which constitute the new, or unnamed, force he is in search of.

Projected Machines.

He brought out from a drawer sundry loose sheets on which he had sketched a number of machines he had projected, which respond to some influence still undefined. "I jot these down as they occur to me," he said, "and when I get enough of them together I shall have the machines made and try to generalize my observations."

Think of it! A man in this skeptical century who dares believe in a discovery beyond all discoveries. Here is a student of nature who is not afraid to have the spirit of a Galileo or a Kepler or an Isaac Newton. "What do you think of the nature of matter?" I asked. The answer was prompt: "I do not believe that matter is inert, acted upon by an outside force. To me it seems that every atom is possessed of a certain amount of primitive intelligence. Look at the thousand ways in which atoms of hydrogen combine with those of other elements, forming the most diverse substances. Do you mean to say that they do this without intelligence? When they get together in certain forms they make animals of the lower orders. Finally, they combine in man, who represents the total intelligence of all the atoms."

"But where does this intelligence come from originally?"

"From some greater power than ourselves." "Do you then believe in an intelligent Creator, a personal God?" was the next question. "Certainly," said Mr. Edison. "The existence of such a God, in my mind, can almost be proved from chemistry."

A Philosopher.

Lucretius thought that all atoms were moved by feelings of love or hate—that we call attraction or repulsion. Edison's idea is far more subtle, since he allows the atoms only a germ of intelligence. It also seems to be quite in keeping with the doctrine of evolution, while it contains nothing that is not in harmony with the idealism of the Platonists. And so we discover down on Avenue B, in the prosaic city of New York, a philosopher who believes in a personal God, and is at the same time the foremost exponent of applied science. Curious that he should be at work here, night after night, in the midst of a million of people, only a few hundred of whom know how he is employed during the nocturnal hours! As a usual thing he works until 5 or 6 in the morning, his supper basket remaining untouched beside him, and it is often 9 o'clock of the next day before he leaves the bench of the laboratory. "I can't think out anything," he says, "except when I'm experimenting. I have a library of 6,000 scientific works, but somehow I can't find what I want in books. How do I make calculations? Well, I don't know, exactly. I can't do it on paper. I have to be moving around."

So there he goes, moving around, thinking and working with his hands, in the big sombre building, while the city is asleep. He is the controlling power of several large factories, a millionaire, a man of business, a marvellous inventor; yet he is as simple and happy as a child, when, in an old seersucker dressing-gown, he can manipulate at will and without interruption the mysterious forces and properties of Nature.

ATMOSPHERIC ELECTRICITY.—Professor Palmieri, of the Vesuvian Observatory, has recently published some observations of interest on atmospheric electricity, which are quite interesting. In clear weather the atmospheric electricity is usually positive; if negative a downfall of rain may be inferred to be going on at some little distance. There is a maximum of atmospheric electricity at 9 A. M., another soon after sunset, which often continues during a great part of the night. A minimum takes place before daybreak, and another in the afternoon. This periodicity is, however, disturbed by atmospheric movements. When the maxima, a very pronounced cloudy weather often follows. If the sky becomes overcast, the electric indications grow stronger, and if at the time of the evening maximum the relative moisture increases with a heavy dew, maxima of special duration and intensity may be expected. The assumption that atmospheric electricity becomes stronger with altitude is not borne out by the Vesuvian observations. Lower potentials are generally observed on hot summer days; in spring

and autumn the indications are stronger; in winter they are uncertain. On cloudy days the potential is less intense, but positive; during rain the potential increases. A rain zone is positive, but surrounded by a negative zone, which again is surrounded by a zone of positive electricity. According to Palmieri, there is no thunder and lightning without rain.

Animal and Vegetable Fibers.

Between the fibers of vegetable and animal origin there is one great chemical difference.

The basis of all vegetable cells is cellulose, a substance which, when perfectly pure, consists of carbon, hydrogen and oxygen, in the proportions indicated by the formula $C_6H_{10}O_5$, and which possesses great chemical inertness, having very little affinity for other bodies, and which can scarcely be acted upon by any reagents, except strong acids and alkalis.

The basis of all animal fibers is gelatine or some albuminoid body allied to it. We never find a trace of cellulose in the animal kingdom. While our albuminoid molecule contains the same substances in its composition as the molecule of cellulose, it also contains two others—nitrogen and sulphur.

This substance or its congeners forms the solid walls of the animal cells which build up the fibers; and whether the materials we have to work upon be the secretion from a worm, such as silk, or the hairs of a goat, or the wool of a sheep, it is the material basis which forms the largest portion of the solid structure. Gelatine has a higher specific gravity than cellulose, and hence animal substances sink in water, while vegetable substances swim. As a rule, the ultimate vegetable cells are larger than the animal cells, and hence there are a larger number of the latter in the same space, and the tenacity of gelatine is also greater than that of cellulose, so that animal substances and fibers are as a rule stronger than vegetable fibers.

Most of the animal fibers are too minute to be examined with the naked eye, except in their general aspect. Hence, we require the use of a powerful microscope when we wish to notice their structure more closely, and especially when we are examining the differences between the various fibers in detail.—Dr. Bowman.

PRIZE FOR A NEW TREATMENT OF COPPER.—The French "Société d'Encouragement pour l'Industrie Nationale," at its general meeting on December 26, 1884, offered a prize of 1,000 francs for the discovery of a "new alloy useful in the arts." This prize has been awarded to M. P. Manhes, now so well known for his successful application of the Bessemer process in the metallurgy of copper, on account of his discovery of the value of an alloy of copper and manganese for improving the quality of commercial copper. It is stated that copper always contains more or less suboxide of copper irregularly disseminated throughout its mass, and that in consequence of this it loses some of its tenacity. M. Manhes prepares an alloy of 75 per cent copper and 25 per cent manganese, and adds it in small quantities to the molten copper after refining, and just before casting, stirring the bath of metal at the same time. The manganese of the alloy is stated to immediately combine with the oxygen of the dissolved cuprous oxide, forming a manganiferous slag, which is easily removed. The operation is cheap, and very much improves the quality of the copper so treated. Also several of the principal alloys of copper, bronze, gun metal, and brass are of superior quality when prepared with copper purified in this manner. It is stated, too, that a series of experiments have proved that copper so treated is much better suited for sheathing ships' bottoms than ordinary copper, as it is more slowly acted upon by the sea water. On these grounds the committee of the society have awarded the prize to M. Manhes.

DRAWING WIRE FROM FLUID STEEL.—The *Manufacturers' Gazette* says: Wires and bars are now produced direct from fluid steel, by pressing it out through dies in a manner similar to the production of lead pipes from lead. An iron vessel, lined with refractory material, is provided with a manhole and a cover at the top, and securely closed. At the bottom opposite the manhole there is a castiron outlet pipe, through which passes a steel tube with water circulating around it like a "tuyere," by which the steel pipe or die can be cooled. The inner end of the steel tube is lined with fire clay, where the very hot fluid steel meets it. The tube is plugged up by a steel stopper, and the liquid steel is filled into the vessel with liquid carbon dioxide above it. The stopper being withdrawn the liquid steel is forced out by pressure of the carbon dioxide in a red hot rod or wire, which goes from the vessel into the rolling mill while still hot, and is there finished off. We may also add that steel is now produced direct from the ore by a new process of a French engineer. The ore in a powdered condition is submitted to the action of carbonic oxide gas at a high temperature in a cupola or blast furnace, where it is reduced by the incandescent gas to pure iron or steel.

AN ELECTRIC AUTOMATIC WEIGHER.—A patent has recently been allowed E. H. Arnet, of Boston, for an electric scale which automatically records and weighs consecutively the weights and numbers of objects weighed.

SAN FRANCISCO:

Saturday Morning, July 4, 1885.

TABLE OF CONTENTS.

EDITORIALS.—Sulphuric Acid and Sulphate of Copper, 1. Passing Events; Industrial Exhibition; Local Marine Work; A Sectional Water-Jacket Furnace; Local Notes; American Pumps Abroad, 4. Sierra Notes; The Washington Medals; Rock Crusher for Small Mines, 5.
ILLUSTRATIONS.—Fig. 1—Crystals of Hanksite; Grouped Crystals; Roessler's Apparatus for Making Sulphuric Acid, 1. Gold Medal Presented by Congress to General Washington, 5.
MECHANICAL PROGRESS.—"Burnt Iron," Soldering in the Machine Shop; A New Steel-Making Process, 3.
SCIENTIFIC PROGRESS.—An Interview with Edison—A New Force; Atmospheric Electricity; Animal and Vegetable Fibers; Prize for a New Treatment of Copper; Drawing Wire from Fluid Steel; An Electric Automatic Weigher, 3.
ENGINEERING NOTES.—Do Large Steamers Pay; Pneumatic Tubes; A Shoal Water Alarm; From the Black Sea to the Caspian; Spans of Telegraph Wire; Bad Engineering, 7.
USEFUL INFORMATION.—A New Solvent; How to Judge of Coal; Fir Leaf Wool; Timber for Wine Tanks; Utilization of Bones; Making Barrel Staves; Thirty Carloads of Strawberries, 7.
GOOD HEALTH.—Resisting Electric Shocks; Curing Rheumatism with Celery; The Approach of Age; Death from Infected Wood; Attention to Details, 7.
MISCELLANEOUS.—Mineral Products of the United States; Helena District, 2. The Gravel Channels of Ancient Rivers; The Copper Mines at Clifton; Where the Ore Comes From; Gumption; Early Day Mining for Gold, 6.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 8-9.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends and Bullion Shipments, 12.

Passing Events.

The Fourth of July week is a short business one. The wholesale merchants of the city agreed to take both Friday and Saturday, so that the greater business of the city closed on Thursday night, and will re-open on Monday morning. The banks closed on Friday at noon. This long respite will send all city people who can escape into the quiet of the country. For those who remain and for those from the country who come to hear the noise of the city for a change, there will be quite a demonstration in honor of the day. In the morning there will be the usual parade of military, civic and trade organizations with the department of the *grotesques* or *horribles* well developed. In the afternoon there will be the unveiling of the Garfield monument at Golden Gate Park. During the day there will be sailing and rowing contests upon the bay. In the evening the literary exercises will be held in the Mechanics' Institute Pavilion. Fireworks will be released from Telegraph Hill and Central Park at eight o'clock in the evening.

The change in the rates of postage went into effect on the 1st inst. Hereafter letters weighing one ounce or a fraction of an ounce will go for two cents. Heretofore the limit for a single rate has been half an ounce. The change does not diminish the denomination of the stamps, but it doubles the weight it will carry.

On the 1st inst. the reduction of force on the railroad lines began. This threw many persons out of employment.

In the mining situation there is little change to note. Men are everywhere at work. California mines are now attracting more attention than for some time past.

Industrial Exhibition.

There seems to be a strong feeling growing up in Europe against industrial exhibitions. It is considered that all are not gainers by these shows, and that the result may be sometimes absolute loss. The committee of the Association of German Iron and Steel Manufacturers having taken this view of the subject thought it good to invite the opinions of its members concerning the proposed industrial exhibition in Berlin in 1888, and for this purpose issued a circular letter. The replies received show that a very large majority are opposed to the scheme.

This seems a step backward in modern investigation. The international exhibitions given in this country and Europe attract hundreds of thousands of visitors, who have an opportunity to examine appliances of all sorts they never saw before. They have been able to compare similar machines of different makers and judge for themselves which was best. It would seem that this result was a good one for the manufacturers of the best article. But they seem to believe the contrary to be the case. That is, they argue that having a perfect machine or appliance any one with a poorer one may copy portions of their machine which are not patentable, and thus improve the poor one, to the detriment of the maker of the good one. This is one of the main arguments used.

In certain classes or branches of manufacture this idea prevails somewhat extensively. Even in our own city, where there are very large foundries and machine shops, our local displays in the machinery line have for some years been poor at the annual fairs; whereas when these fairs were organized the display was always large. Aside from the attendant expense, the manufacturers claim that they are able to advertise their machinery products better in the technical or trade journals, being thus able to reach their special customers. For after all industrial exhibitions are only advertising schemes on a large scale. If the exhibitors did not expect some benefit they would not come in and make displays. For many things these fairs are of great benefit, but it seems that many makers of machinery both here and abroad have concluded they do not gain enough to compensate for time, trouble and expensive exhibiting. This determination seems one of the rather curious results of perhaps too frequent expositions.

Local Marine Work.

The great necessity of a place especially adapted for marine repair work has long been recognized here, but until the Union Iron Works fitted up their ship-building plant at the Potrero, there were no special facilities at this port. Steamers were hauled alongside wharves, at long distances from the foundries and considerable delay and expense were entailed in carrying on the work. Now, however, a vessel can be taken alongside the dock close to the works where there is every facility for making repairs. A powerful crane is conveniently arranged to take out and put in machinery and boilers, and in the shops are all necessary tools for doing any kind of work. It is the intention before long to build a marine railway so that vessels may be taken out of the water when necessary. The railway will be built close to the launching ways, where iron and steel vessels are built. When this and the plate mill are added to the plant it will be as well equipped for marine work as any in the United States.

As we mentioned at the time, a steel steamship was completed at their works not long since, and has proved herself a superior vessel, in every way satisfactory to her owners. The Union Iron Works are now engaged in making extensive repairs on the Pacific Mail Company's large steamship Granada. The vessel is to be thoroughly overhauled, and has been taken to the works for the purpose. Changes will be made in the saloon, new boilers put in, and she will be equipped with a steam steering gear—something she has not had heretofore. The alterations will require five or six weeks to complete, but the work will be done as rapidly as possible. Except to keep her in ordinary repair, she has not been released from active duty since 1873.

The question of a division of Colusa county is being discussed among the newspapers of that section.

Local Notes.

The coal and iron industry in this city is still in an unsatisfactory condition, as has been the case for some months. Iron is dull all over the country. As far as the local trade is concerned all the foundries are very slack, some of them doing scarcely anything. Coal supplies are heavy, the coast collieries now being able to supply Pacific Coast wants regardless of foreign mines.

The Union Iron Works have so far not succeeded in raising the sunken ship, Earl of Dalhousie, for which they have a contract.

The burning of the Hackstet dredger, in Oakland harbor, will not delay the work of making the approach to the canal which is to be cut into San Leandro bay, as the Von Schmidt dredger has started in to complete this contract. The Von Schmidt dredger has been more successful than any dredger heretofore built on this coast in working in the soft mud of the Brooklyn basin. It is about to start in cutting off this neck of land in front of East Oakland, which forms the west side of the basin. A large area has already been dredged. The mud is deposited on the adjoining marshes, and a large amount of marsh land has been reclaimed by being raised several feet.

Mining companies having their offices in this city paid in dividends in June \$202,500, as against \$204,716 in the same month last year. The powder manufacturing companies paid \$90,000 in dividends, as against \$22,760 in June of last year.

Competition in through overland passenger rates cannot be looked for until the completion of the Canada Pacific, which, it is now promised, will be some time in October next. Even then San Franciscans will have to transport themselves to Puget Sound before they can begin to take advantage of the Canada Pacific rates, no matter how low they may be.

An immense amount of money has accumulated in the sub-treasury of this city. The aggregate is now \$90,070,360. The distribution of this money is in gold and silver coin and greenbacks. In the first vault there are \$40,000,000 gold in \$20,000 sacks, and \$1,000,000 in greenbacks. In the lower vaults are kept the silver dollars. Vault No. 1 has 3,168 cubic feet of coined silver, vault No. 2 encloses a pile of money 36 feet long, 9 feet wide and eight feet high. One cell has stowed away \$22,037,000 in \$20 gold pieces, and in the other cell there are \$8,000,700 in silver coin. The other vaults contain silver dollars and halves to the amount of \$6,600,000. The contents of these six vaults would raise a mound of coin four feet wide, four feet high and 448 feet long, representing over 500 tons of precious metal. The utmost precautions are observed to secure this treasure. The vault doors are so constructed as to defy the ravages of fire or the efforts of a regiment of thieves, and electrical wires run all through the building so that it would be impossible for a burglar to work without his tapping one of these wires and raising an alarm. Every half hour watchmen pass the vault doors, and must also every half hour ring up the district telegraph to show that they are on the alert.

American Pumps Abroad.

The English papers have not yet got over grumbling at what they call the unfortunate decision of their Government in ordering American (Worthington) pumps for Suakim. The direct loss by the home engineering industry was at first the only thing considered. But now it seems they have found that the impression on the continent is that the American pumps were chosen, because superior to English, and the effect is to greatly discredit English makers of all classes of mining machinery.

Perhaps this continental impression concerning the pumps, at least, is perfectly correct. The steam pumps made in the United States are now the best in the world. We have had plenty of experience, and hundreds of improvements of more or less value have been made and patented. Pumping has had to be done in this country under all sorts of circumstances, and the machinery has been made in perfect adaptation to the work to be done. Our large pump manufacturers lose no chance of improving and perfecting their engines, and are not content to let well enough alone, but want to do better still. Perhaps this is one of the secrets of their

success. At all events they have been successful and the American steam pump is now sent all over the world.

A Sectional Water-jacket Furnace.

Mr. Edward Probert, of this city, has invented a blast furnace with such an arrangement and construction of tuyeres as enables him to largely increase the capacity of the furnace. The peculiar water-jacket which surrounds the region of fusion he calls a hydro-cycle, and it consists of a circular series of independent and separately removable calls suitably joined. This new furnace Mr. Probert has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency.

The special objects or advantages which are claimed for the furnace are its large smelting capacity, the facility with which it can be repaired even while in operation, and the facility, generally, with which the entire operation may be carried on. The first of these advantages arises from overcoming certain disadvantages in the ordinary furnaces. It is well known that on the construction of pressure blast furnaces of the common type, the diameter should never exceed twice the "throw" of the blast—that is, twice the distance to which the blast penetrates the charge, or, say, from 30 to 40 inches.

This necessity limits the smelting capacity so that the daily production rarely exceeds from 20 to 30 tons. Mr. Probert considers that his invention renders it possible to increase the diameter of the furnace, and therefore its productive or smelting capacity, more than two-fold without materially increasing the cost of construction, while the running expenses are reduced.

The second advantage arises from the peculiar construction of the hydro-cycle, the elements or independent cells of which are so fitted to place and united as to render it possible for each to be cleaned while in place, or taken out for repairs while the furnace is in actual operation, with the least difficulty and in a short time. The last advantage results from the general construction.

By projecting a tuyere through the lining of the furnace and into its region of fusion, it is possible to increase the diameter of the furnace; but in order to maintain such an inwardly-projecting tuyere it must be either of material refractory enough to withstand the heat or must be a water-tuyere. With a long water-tuyere, such as Mr. Probert prefers, and with so much weight on its inner end, it becomes essential to provide a firm support on the body of the furnace through which it passes. As, however, the water-jackets withstand the action of the heat there remains a firm support for the tuyere, an important feature in the furnace.

The novelty to be noted about the upper part of the furnace is the wind chamber, which, instead of being made of thin, galvanized iron or zinc, as is usual, and serving merely for the distribution of the blast, is made of iron plate or short sheet iron or cast iron, and converted into a hollow girder, in section a right-angled triangle, which, encircling the shell beneath a flange, receives its weight and transfers it to cast iron pillars on which it rests. By thus making the girder triangular instead of rectangular sufficient strength is obtained with less material.

The water which is supplied to the tuyeres and hydro-cycle becomes hoiling hot and usually leaves deposits on the inner surface, which tends to cause the iron to burn out, and hence the importance of leaving the water cells open at the top, so the deposit may be readily removed.

The furnace is circular in form and even feet in diameter, and is capable of smelting from 50 to 60 tons of ore daily; but the principle by which the capacity is increased is applicable to the construction of a still larger furnace. For retaining the diameter of seven feet (which has been found the most advantageous in practice), all that is necessary is to separate the two semi-circles into which the plane of the hydro-cycle may be supposed to be divided by a space, say equal to the semi-diameter of the furnace, or three or one-half feet, and then to introduce into the openings on either side a pair of additional cells of rectangular shape (not curvilinear) when the furnace will be converted into an oblong one with circular heads or ends capable of smelting from 80 to 100 tons daily, which is the capacity of one now in actual use, and which has even exceeded the highest production named.

Sulphuric Acid and Sulphate of Copper.

Continued from page 1.

from parting bullion. It is only necessary to fill the converter with water, in reduce copper, as "cement" or otherwise, into the apparatus, and turn on the injector, and the reaction begins. At first only the sulphuric gases are absorbed, and dilute acid results, which at once dissolves copper and makes blue vitriol, and then this salt acts on the sulphurous acid, as above described. Thus it becomes possible to produce a solution of blue vitriol, which gradually becomes concentrated to 35° B. in the converter. When this stage of concentration has been reached the solution can be drawn off and replaced by a fresh charge of water. This blue vitriol may be crystallized and sold as such, or the metallic copper may be recovered by a dynamo machine, or precipitated by other means.

The importance of Dr. Roessler's process for parting establishments, Government mines and other chemical and metallurgical works and factories located in large cities cannot be overestimated. By the use of the converter, at a very small first cost and trifling expenditure for space, the means are provided of profitably utilizing gases which have hitherto been discharged into the air, to the damage of the public health and surrounding vegetation.

Many copper mines and other sulphuret mines, distant from railroads, will find in this process a ready means of obtaining a supply of sulphuric acid without erecting and operating expensive lead chambers.

In parting works a marked advantage of the process is the entire freedom from acid fumes of the rooms in which the parting kettles are used, and the consequent good health of the operators.

In connection with this description of Dr. Roessler's process, it may be of interest to give an account of the many unsuccessful experiments made to abate the evil of escaping acid fumes. To obtain reliable data in the experiments, the gases operated on were analyzed by measuring the volume required to decolorize a standard potassium permanganate solution, and then determining the SO_2 in this solution by precipitation with a base. Computation will readily determine the amount of SO_2 due to the SO_2 , and the difference will give the SO_3 present as such. In this manner the average of one cubic meter of gas from parting kettles was found to contain 100 grams SO_2 and 20 grams SO_3 , or four per cent, by volume, of sulphurous acid gas.

I would here call attention to the fact that to make the manufacture of acid in lead chambers a commercial success, at least eight per cent of sulphurous acid should be present in the gases. It is one of the advantages of Dr. Roessler's process that even a fraction of one per cent of sulphurous acid can be utilized at a profit.

Dr. Roessler recognized almost at the beginning, the fact that the sulphuric fumes create the main annoyance. Sulphurous gases are considerably lighter, and are, to a large extent, diffused by the air before they fall to the ground and create annoyance.

His first experiments were made entirely with this fact in view, and consisted in passing the gases through a layer of incandescent coke. The sulphuric acid was, it is true, reduced to sulphurous acid, but in ascending the chimney of the works, a portion, at least, was reconverted, and eventually the annoyance of stoppage of the draught led to the final abandonment of the system.

Dr. Roessler next turned his attention to absorption of the gases by water. A large tower, 65 feet high and 9 feet square, was filled with coke, and a plentiful shower of water passed over it. A long conduit, connecting the tower with the parting-kettles, was also filled with numerous jets of water. However, notwithstanding the fact that the temperature of the gases was reduced by two-thirds, and a large outlay for water incurred, the system absorbed only one-half of the sulphuric acid and less than one quarter of the sulphurous. This system, by the way (although in a cruder and less complete form), is that used by the United States assay offices in New York and San Francisco. How incomplete is its operation, everybody living within several blocks of these works can bear testimony.

Subsequent experiments led to the abandoning of the coke filling of the lead-tower and its replacement by an extremely fine spray of

water, created by jets of water under heavy pressure impinging on platinum plates. The success of this system was somewhat greater. Three-quarters of the sulphuric acid was absorbed, but only one quarter of the sulphurous could be caught.

Finally, and quite accidentally, Dr. Roessler's present system, as described, was hit upon. It has been eminently successful, and where used has completely stopped the nearly too well-founded complaints of discharging the noxious gases into the air, and has converted a source of annoyance and expense into a source of profit.

Sierra Notes.

The mines in various parts of Sierra county are doing very well just now, some of them producing large amounts. We saw at the office of the Miners' Association this week a fine nugget from the Ruby gravel mine, between Forest City and Downieville. The nugget weighed 32

The Washington Medals.

Hardly any subject could be more appropriate to the celebration of the national holiday, and at the same time furnish information which the younger generation know little of, than that which we have chosen for illustration on this page—the Washington medals. The engraving on this page shows the gold medal presented to George Washington by Congress on the evacuation of Boston; also, Fig. 1, the arms of the Washington family, and, Fig. 2, the seal used by General Washington.

This gold medal commemorative of the evacuation of Boston became the property of George Steptoe Washington, the son of Samuel Washington, who was the General's elder brother. The next owner of the medal was Dr. Samuel Walter Washington, eldest son of George Steptoe Washington. On the decease of the doctor at Hasewood, Virginia, in 1831, his widow became possessed of the relic. She is still living.

GOLD MEDAL PRESENTED BY CONGRESS TO GENERAL WASHINGTON.

ounces in gold. It is rather a peculiar piece, some of the gold being crystallized. The gold looks, moreover, as if it had formed around or on the quartz (which is not homogeneous). In fact, it looks like some sort of electrical deposition on the body of the quartz. Some portion of the gold has the appearance of having been beaten or hammered. The nugget is very handsome.

From a private letter we learn that the Bald Mountain Extension claim cleaned up last Sunday 123 ounces, making the total for the past two weeks, 203 ounces, or \$3,775.80. The clean-up of the Bald Mountain claim was 78 ounces last week. From an upraise in the Bald Mountain Extension ground recently, from five carloads of gravel over eight ounces of gold was washed. It is generally conceded that this claim is one of the bonanzas of the coast.

The statement recently published by a contemporary that the Standard Oil Company had absorbed the Continental Oil and Transportation Company, the Pacific Coast Oil Company and all the minor corporations dealing in crude and refined petroleum on this coast is denied by Manager Tilford of the Branch Standard Oil Company in this city, as is also the statement of the Branch Standard, Continental and Pacific companies will incorporate as one company.

She had given it to her only son, George Lafayette Washington, who had married the daughter of her brother, the Rev. John B. Clemson, of Claymont, Delaware. On the recent decease of George Lafayette Washington, the medal became the property of his widow, Mrs. Ann Bull Washington, from whom with proper certificates and vouchers, by the generous co-operation of fifty citizens of Boston, it has now been secured to the permanent ownership of the city of Boston, with which it has been so gratefully identified, and has been deposited in the public library.

Thus it appears that the medal has been transmitted through the descendants, in successive generations, of General Washington's elder brother. They have fully appreciated its intrinsic and symbolic value, and have anxiously taken care for its safety under the risks and perils which have attended its preservation. It is, itself, a most beautiful and perfect specimen of workmanship of the die and mint, and is without a blemish or any perceptible wear of its sharp outlines. During our civil war its then owner, George Lafayette Washington, was residing eleven miles from Harper's Ferry, on the main route to Winchester, where the helligents held alternate possession. The medal, in its original case of green seal skin,

lined with velvet, was enveloped in cotton, and, deposited in a box, was hurried in this dry cellar of a venerable mansion where General Washington usually spent many months of the genial portion of the year. The original case, which fell into decay by this exposure, accompanies the medal in its present repository.

The medal, of which the engraving gives a *fac simile*, was the only gold medal given by Congress to General Washington. Between the dates of March 25, 1776, when this gift was bestowed by a resolve of Congress, and the year 1786, by votes of the same body, a series of 10 more gold medals was struck at the Paris mint, commemorative of the great events and the great men of the War of the Revolution. All the "Washington Medals" are now in Boston.

Rock Crusher for Small Mines.

A rock crusher and breaker has been invented, the greater part of which, being of plain timbers, is adapted to be constructed and used with advantage at small mines and out-of-the-way places where it would not be advisable to transport more expensive and elaborate machinery. It has been patented through the MINING AND SCIENTIFIC PRESS Patent Agency by Cornelius W. Huson, of Weaverville, Trinity county, who has assigned a half interest to Wm. F. Jenkins, of the same place.

Mudsills made of plain timbers are laid parallel, and cross-sills of a similar nature are mounted on them. The middle one of the cross-sills has the head bolted to its center. This head consists of a metal piece, the face of which is concave longitudinally, and its sides provided with upwardly-extending flanges.

The metal die also has a convex face, and both head and die are provided with suitable shoes. The convex face of the die is made on a curve having a shorter radius than that of the curve on which the concave face of the head is formed. So that when the die is at rest on the head it hears on its center, its ends being separated from the ends of the head by reason of a divergence in the curves of the faces. There are thus left or formed spaces at each end between the head and die.

The die has a width just sufficient to permit it to lie snugly between the side flanges of the head, and it is provided with upwardly-extending flanges, by which it is bolted to the block, the flanges being let in to lie flush with the sides of the block. This block is bolted to a long timber or beam, which is raised high enough to permit the interposition of screens at the ends of the head and die without interfering with them when said beam is rocked. In the center of the beam is bolted solidly an upright, or standard, from the top of which extend solid braces to the ends of the beam; and other braces make the whole frame rigid. This frame thus looks something like a pump-bob.

A water-wheel, or other source of power, is suitably connected with the top of this triangular frame. Upon the ends of the beam of this frame are boxes in which rock may be placed, serving as counterbalance or weights. The rock beam is suitably guided so it cannot get out of line.

Extending sidewise from the rock beam are journals which lie loosely on hearings on the side beams. These journals do not mount the rock beam, which has its pivoted action in the head, but simply act as safeguards against any tendency of said beam to slip in its hearing on the die. In the side beams are made feed hoppers or apertures which slope downwardly and inwardly, and terminate just at the top of the side flanges of the head and near their ends, whereby the rock is adapted to be delivered by falling over the flanges directly into the sides of the end spaces between the head and die. Discharge chutes are outside the screens, and emerge through spaces between the cross-sills. Through the pitman the standard is rocked, thus rocking the beam and die. The rock being fed in between the die and head is then crushed. Passing thence through the screens it runs into and is discharged by the chute. It will be seen that the whole machine is simple in construction and inexpensive, being adapted for use anywhere. There is very little iron in its construction.

FINAL preparations are now making at Philadelphia for an expedition to Vigo, Spain, in search of the Spanish treasure galleons sunk in the bay in 1702.

The Gravel Channels of Ancient Rivers.

The ancient gravel channels of California were formed, it is believed, during the Pliocene period, and extend from Mariposa county in the south to Siskiyou county in the north, having an aggregate length of about 350 miles. The auriferous area has been estimated to be 200 square miles. These channels are from 200 to 400 feet wide on the bottom, and sometimes as much as 2,000 feet wide on the surface. They are filled with gravel from depths of 20 to 400 feet. The deposit at the bottom consists of boulders, cobbles, gravel and sand firmly cemented together. This bottom deposit is commonly known as the "blue lead" from its color, and varies in thickness from 20 to 120 feet. Above the "blue gravel" is found the "top gravel," consisting of sand and occasional boulders, with sometimes layers of pipe-clay. Near the surface is found red soil, varying from a few feet to 20 feet in thickness. Gold is distributed very uniformly through the entire mass of gravel, being most abundant near the bed-rock. These ancient channels are sinuous in their course, and have many branches and tributaries. Their grades vary from 20 to 300 feet per mile—sometimes confined within narrow banks, and again assuming lacustrine proportions. They undoubtedly carried more water than do the present rivers of California. The fact of the material being coarser and larger at the bottom is due to the great velocity of the rivers where confined in narrow channels. As the filling increased, the transporting power of the streams became less from the diminished depth of the water, and hence the latter deposit was of firm material.

The principal gravel mines of California are situated in the counties of Yuba, Sierra, Placer and Nevada, in the region drained by the Feather, Yuba and Bear rivers. It has been estimated from careful canvass of this industry that there are on the drainage system of these rivers 300 mines or tracts of mining lands which have been worked within the past three years, though not, perhaps, simultaneously, by the method distinctively known as "hydraulic mining," besides numerous "drifts," "rivers" and placer mines, which are dependent upon water washing. The magnitude of these mines, whether hydraulic or drift, depends on the width and length of the channel.

The San Juan Ridge at North Bloomfield has a channel about 200 feet wide on the bottom and 800 feet wide at the surface. The company own about 19,000 linear feet of the channel, which has been continuously worked since 1853—the top dirt having been removed in early times. The value of that channel has been demonstrated to be about \$850 per linear foot, say \$4,500,000 per mile. To reach the deep or bottom gravel, they drove a tunnel 11,874 feet in length, which was not completed until 1874. Since that time the company has worked 3,500 feet of the main channel, leaving 15,500 feet to be worked, which it is estimated will produce about \$13,000,000. The company's outlet tunnel also commands about one and one-half miles of channel, which it may be estimated will produce \$8,000,000, or, say, a total of \$21,000,000, based on estimates of past production covering a period of about 20 years.

The mines of the Milton Company have a length of about 17,500 feet, which, it is estimated, will yield at the rate of \$5,500,000 per mile. The tunnels of this company command about two miles more of channel. The contents of this area of unworked ground will not fall short of \$20,000,000.

The channel on which the Bloomfield and Milton Companies are operating has been opened in so many places that its position has been accurately determined and its contents approximately ascertained. Within the limits of the San Juan Ridge alone, in the county of Nevada, it is known that there remains to be abstracted about \$90,000,000. In other portions of the county the position of the gravel channels is not at present so well known. It is, however, known that they exist for many miles in length, and the gross yield will vary between \$4,000,000 and \$6,000,000 per mile.—W. A. Skidmore, in *Mint Directors' Report*.

FIRST BRICK.—The first brick from the mining enterprise recently inaugurated near Hiko was brought in town Thursday morning by George Warren. Its value is \$1,684.89. This brick was the result of an eight day run of the little one-pan prospecting mill, and the result shows for itself. The mine is reported looking excellent, showing a very liberal quantity of good ore. The ore, thus far, has improved as work on it advanced. Mr. Warren says, as the developments in the mine warrant it, and the test has proven all that the most sanguine could hope, that if arrangements for leasing the mill at Hiko cannot be agreed upon, he will then proceed to erect a 15 or 20-stamp mill. The company is called the Howell-Warren Lytle S. M. Company.—*Pioche Record*.

THE *Cœur d'Alene* mines are in a bad fix this year through litigation. All the best properties in the camp have been enjoined on technicalities in connection with the use of water and dumping ground, and there is a great stagnation in consequence.

The Copper Mines at Clifton.

A Very Narrow Gauge Railroad.

From an extended article in the *Deming (N. M.) Tribune*, describing the mines of the Arizona Copper Mining Company, we make the following extracts: The property now includes the following claims: Coronado Lode, Crown Reef, Copper Crown, Matilda, Horse Shoe, Boulder, Copper Queen, Copper King, Thomson, Worfold, Goodsight, Vicksburg, Sherman, Humboldt, Joy, Yavapai, Detroit, Michigan, Ballyrat, Bartlett, Basset, Clifton, Longfellow, Modoc, Emma, Nora, Arthur, Princess Alice, Cornell, William Grant, Bendigo, Copper Pride, Fairview, Lolo, Cap Bonanza, Lucky Friday, Libbie Annie, Libbie Grant, Oriental, White Hawk, Black Hawk, Southern Cross, Fraction or Dark Horse, C. L. Junction, Peak, Northern Cross, Pyramid, Troy, U. Extension of Clay Mine, Dora, Seven-Thirty, Regular, King, Ida, Arizona, Indiana, Richmond, Santa Fe and Iroquois.

There has been steady progress in the means of transportation for the ores from these mines. At first the ore was taken to the little smelter, on the creek, on the backs of burros; then a wagon road was constructed, after the furnaces had been erected at the river, and large amounts were hauled down in wagons; then, about six years ago, at the suggestion of Captain Davis, a twenty-inch narrow gauge road was laid up the canyon, first to the Longfellow mine, and afterward extended to the others. The grade is generally about four per cent, or two hundred feet to the mile, but in several places it is as much as five, and in one or two places six per cent. The first engine was a little four-ton fello, which is now in use on the upper road from the Longfellow around to the Detroit Company's mines. This was substituted by one weighing eight tons, and a third one of twelve tons was afterward put on. It is really surprising to see the loads which these powerful little machines take up the steep grades, and to note the ease with which they are handled. They stop and start at any point and gain headway rapidly, although the average speed is but eight miles per hour. The cars are wholly of iron, and carry a load of three or four tons. Although the track is so narrow, the cars seem to ride just as steadily as on a broad gauge road. Not an accident has ever occurred to kill or wound a person since the road has been in operation, and this is no doubt largely due to the care exercised by Mr. Arbnockle, the engineer, who has been running the trains ever since the road was built. Although there is but comparatively little load up the grade, except for the Morenci works, the engines are competent to take up eight or ten loaded cars, or fifteen to twenty empty.

The Inclines.

The ore from the several mines is moved down to the main track of the road we have described by means of inclines of varying degrees of pitch, the loaded car going down as the empty car goes up. The incline at the Longfellow is 2,200 feet long, 600 feet through a tunnel, and the elevation gained is 780 feet; at the Metcalf the incline is 1,100 feet long with 500 feet elevation; at the Coronado the incline is 3,320 feet, and the elevation 1,100 feet with a maximum grade of 68 per cent; at the Queen the length is 900 feet. At the Longfellow the four-ton cars are used the same as on the main line, two coming down together, and one loaded and one empty going up. The speed is regulated by powerful brakes at the head of the incline, the cables passing several times around large drums to which the brakes are fitted.

The Smelters.

The plant now consists of three Fraser and Chalmers furnaces, each of 60 tons, and two Pacific Iron Works smelters of 40 tons capacity. As previously stated the water power of the river is utilized, and three turbine wheels are employed of different capacities, according to the work upon them. The principal one drives the Baker blowers, five in number, three number sevens and two smaller ones; another drives the crushers, and still another the pumps. To insure against a scarcity of water or injury to the wheels there is a fine Corliss engine with ample hoiler capacity to be used as a substitute in cases of necessity. Benches have been cut in the hillside, which is nearly perpendicular in rear of the works, for the ore bins and chutes so that the ore, fluxes and fuels are unloaded from the cars by dumping directly into the bins at the proper level, and these are transferred to their appropriate places by tramways from the chutes to the bins emptying upon the charging floor.

The water is taken from the river about one mile above the works, and is brought through a flume eight feet wide by four feet in depth. Close by the smelting works a substantial building accommodates the machine shops and repair shops of the company, not yet fully in operation. Recently the entire charge of the machinery has been placed with Mr. W. C. Boylan, who for two years past has been master mechanic of the Arizona and New Mexico railroad. He is a very competent machinist and has tried his hand successfully at invention. One of his inventions is a steam attachment to clear the locomotive ash box while the train is in motion; another is an equalizer attached to car brakes to prevent the wheels from sliding.

Only two furnaces were in operation at the time of our visit, although three have been in

blast most of the time. The production for the preceding week had averaged 13 tons of 98 per cent copper per day.

The total production of the mines was given me as nearly as possible by Mr. Russell, as follows: Under the former ownership between 45,000 and 50,000 tons of ore had been taken out, yielding 7,500 tons, or 15,000,000 pounds of black copper. The production by the present company, to May 1st, has been 9,000,000 pounds. The present rate of production is between six and seven million pounds annually, which is not quite half the capacity of the works, if they were in full blast. At the present low price of copper, although it is possible to manufacture the copper at a profit, it is not a sufficient inducement to work up the higher grades of ore, and as we have before noted the object is to make it pay its way and to develop the ore bodies so that the production may be increased when the price shall justify.

Where the Ore Comes From.

Men and Wages at Butte, Montana.

From an article in the *Inter-Mountain* we take the following:

The Colorado smelter gets its ore from the Cagnon, Star West, Self Riser, Clear Grit and a number of manganese prospects west of Butte. Its capacity is about 60 tons daily. A large ore surplus is on hand. It employs 200 men. The monthly pay roll averages \$50,000, inclusive of money paid to wood-choppers and for supplies, but not for ore.

The Parrot smelter works no custom ore, and is kept supplied from the Parrot mine, which is producing 350 tons of ore daily. The company employs 350 men, and its monthly pay roll averages \$50,000 for labor at the mine and smelter and local supplies.

The Montana smelter is running on ore from the Colusa, West Colusa and Montana Parrot. The employees number 300. The company pays out monthly \$40,000. Capacity of works, 250 tons daily.

The Bell smelter is running one stack, treating 30 tons of ore daily, employs 60 men and pays out for labor about \$6,000 per month. The company is handling Bell ore exclusively. The total local expenses of the company are \$18,000 per month.

The Silver Mills.

The Lexington stamps are all dropping now on ore from the company's mine, which is producing 60 tons daily. The company employs 250 men, and its monthly pay roll and local supply bills amount to \$60,000.

The Moulton mill is working 20 stamps on Moulton ore and 20 on custom ore from half a dozen different prospects. The ore bins are full to overflowing. The company employs 125 men and pays out monthly \$25,000 for local expenses.

The Alice mill is doing steady work daily on 60 tons of Alice ore, 40 tons from the Magna Charta and some from a surface prospect on the Valdimere. The company gives employment to 300 men, and disburses monthly between \$50,000 and \$60,000 in this city for labor and other local purposes.

The Silver Bow mill is working 30 stamps on ore from the Poser and La Plata and is also doing some custom work. The company employs directly and indirectly 100 men, and is paying out for wages and supplies \$25,000 per month.

The Anaconda.

The Anaconda smelter in the Deer Lodge valley of course gets its entire product from the company's mine, amounting to 600 tons daily. The mine gives employment to 325 men, whose wages alone amount to \$35,000 per month. The total monthly disbursements of the company in this district average \$60,000, in addition to which \$50,000 per month is disbursed for wages alone at Anaconda. The expenses of the company at the mine and smelter may be safely estimated at upwards of \$200,000 a month, including payments for wood.

Other Disbursements.

The Clark Colusa, Neptune and other private properties of W. A. Clark cost not less than \$15,000 per month for the 150 men he employs. The Bluebird employs 35 men, and Mr. Van Zant's total expenses cannot be less than \$10,000 for wages and supplies. The Rising Star, Clear Grit, Mountain View, Goldsmith, None Such, Silver Safe, Springfield, Elm Orlu, Little Darling and other private properties afford employment altogether to between 325 and 350 men, whose wages amount to \$30,000. Mining supplies will swell the amount to \$40,000 paid out in this district.

WOULD LIKE TO SEE IT.—Of late there has been a great deal of speculation in the outside papers about a new mill which is to be erected at or near Candelaria. When W. J. Sutherland and party were here there was some talk of a speedy completion of the Princess mill. Not a lick has yet been struck and no immediate prospect of it, though all concerned think the plan and proposition a good one. This has been the song of the Princess company for the past two years or more. It has also been said the Victor company intended putting up a mill, if the rock sent to Belleville for reduction netted above a certain figure, but the mill machinery don't begin to arrive.—*Candelaria True Fissure*.

DURING May 5,656,000 feet of lumber were exported from Puget Sound.

Gumption.

Mr. Edward Atkinson, of Boston, recently addressed the members of the Golden Branch Society, of Phillips' Exeter Academy, upon "What Advantage Does an American Boy Possess?" Mr. Atkinson urged that the young men who are so soon to become the workers and controllers in the business of life should be careful not to become one-sided, and not to lose the "gumption" which every Yankee boy ought to possess, and which does not form a part of the curriculum of the school or college, but is developed or lost in that part of the process of education which is outside the books and independent of the teacher. Gumption is that power of applying the work of the hand and brain together under the quick application of the will, which makes a boy or man ready for any emergency, and enables him to decide at a glance, or with a single thought, the right way of doing something. In the old time, although the organization or the schools was not as perfect as it is to-day, and although the teachers were perhaps not as competent as those of modern time, while the variety of instruction was far less, there was a no less number of able and capable men among the graduates of schools and colleges in proportion to the whole number of pupils than there is to-day. The necessity which was imposed on the rich and poor alike to do some part of the work of life with their own hands, while they were attempting developing their mental powers, worked in the direction of that readiness and versatility which we call gumption.

It is obvious to men who have been engaged from very early years in the active work of life, and have been charged with the duty of selecting men to fill important places, that the number of school or college graduates who have been adequately prepared to apply their instruction to immediate use constitutes a painfully small proportion of the whole number. It may be admitted that the only true result of school and college training is to enable a young man to know when and how to begin the real education which must form part of his life, and which will not end except with life, but it ought not to happen that the method of preparation is so ill-advised that it disqualifies the graduate in a measure for the work which he must do. The address throughout was an argument in favor of students endeavoring to acquire not only that knowledge that will enable them to design, but the gumption which facilitates the ready application of knowledge to the execution of design in whatever work may demand their attention.

Early Day Mining for Gold.

In his address at the recent reunion of the residents of Tuolumne county, Mr. W. W. Stetson said:

Nothing raises the spirits like good luck or prosperity. I thought the scenery was the grandest in the world when I carried home at night a pan containing six hundred dollars in gold dust. And what a God-forsaken country it looked when the claim paid only a dollar a day!

California is estimated to have produced nineteen hundred millions of gold, and it is fair to presume that Tuolumne county has contributed two hundred and fifty millions of that amount. The section of country lying between Sonora and Columbia, and embracing the camps and towns of Gold Springs, Yankee Hill, Brown's Flat, Springfield and Shaw's Flat, is said to have been the richest placer mining district in the State of California. An old river channel leading from this section into Table Mountain contained gravel of remarkable richness. The deposits or pockets found in Bald Mountain have proved the richest of anything of their kind in the world.

In the early days, and before people were familiar with mining, it was laughable to observe the crude and awkward machinery that inexperienced miners invented and shipped out via Cape Horn to aid them in extracting the precious metal from the soil. One contrivance was a scow, with a scoop and tongs, to work deep places in the bottom of the rivers, after the manner of oyster tongs. The inventor thought to secure great chunks, while his envious competitors were panning out the fine gold in shallow water. I well remember, in 1849, in the Eastern States, making some peculiarly shaped square pans of Russia iron for an inventive genius. While lying in the shade on the banks of the Stanislaus river, years later, I found one of those identical pans, showing that the machine had really arrived at the mining region, and, like many other inventions, had failed to work.

DOCTORVILLE is the name of a new camp in the *Cœur d'Alene* mines. It is situated seven miles above Eagle, on the west fork of Eagle creek. A number of valuable mines have been opened in the vicinity of the new camp.

THE *Husbandman* says some Butte miners are developing several newly discovered leads in the Castle mountains, Meagher county, with a prospect of very profitable results.

SEVENTY-ONE loads of dirt, from the excavations at Helena, M. T., where the Union block is to be built, were sliced out last week, and yielded \$504 worth of gold dust.

ENGINEERING NOTES.

DO LARGE STEAMERS PAY?—"The chief reason why the European passenger steamship business has ceased to be profitable to some of the old established companies," wrote a shipping agent of long experience a short time since to the *New York Herald*, "is a very simple one. This idea of enormously large and very fast ships has been overdone. These new, fast boats do not pay, and never will, because their running expenses are too high, and they use so much coal that it leaves very little room for cargo. Take the *Etruria*, for instance, the big now Cunarder. She crosses the Atlantic in six days and a half, but she burns 350 tons of coal a day, and of course must carry at least 3,000 tons in her bunkers when she leaves her dock. This leaves room for only 400 tons of cargo, and at the very low prices for ocean freights which have prevailed for a long time past there is very little margin for profit. Now compare a steamer like the *Germanic* with the *Etruria*. The *Germanic* makes the run in seven days and a half, taking a day longer than boats like the *Etruria*. But she consumes only 100 tons of coal a day. And in place of 400 tons of cargo the *White Star* steamer can carry 2,200 tons. Don't you see the difference in the earning capacity of the two? I think the limit of speed consistent with economy was reached in what have now become the slower boats, of which the *Germanic* is a type, although, as far as I am concerned, I don't see why they are not fast enough for any body." "But vessels like the *Etruria* can carry more passengers, and is not the loss of cargo made up in this way?" "No, they can carry a few more passengers, but they can't get any higher rate for them, and the difference does not make up for the heavy increase in running expenses. You can put it down for a certainty that these new and very fast boats do not pay."

PNEUMATIC TUBES.—The French use the following method for removing obstacles from pneumatic tubes: The position of an obstruction is determined by simply firing a pistol into the tube. The resulting wave of compressed air traversing the tube strikes the impediment, and is then deflected back to its origin, where it strikes against a delicate diaphragm, its arrival being recorded electrically upon a very sensitive chronograph, on which also the instant of firing the pistol is also recorded. The wave of sound on reaching the diaphragm is recorded and then reflected back, a second time striking the obstacle and returning to the diaphragm. The operation being several times repeated, the exact position of the blocking matter is ascertained.

A SHOAL WATER ALARM.—In order to facilitate the navigation of the treacherous water of the Nile, Messrs. Yarrow have designed a permanent sounding apparatus which will notify the shoaling of the water some distance ahead. This is described as consisting of two poles about 50 feet long, at the end of which are suspended two vertical iron rods. One pole projects direct ahead from the port side, and the other from the starboard side. Attached to each of these two vertical iron rods is a wire rope which passes inboard, and is connected with the whistle on the boiler; and the gear is so arranged, that immediately this indicator touches a rock or sandbank it instantly causes the steam whistle to blow.

FROM THE BLACK SEA TO THE CASPIAN.—Russia is about to begin a second railroad between the Black sea and the Caspian, along the foot of the Caucasus on the north, while the existing railroad is south of the mountains. Like the other Russian railroads, it will be a five-foot gauge. The cost, with harbor improvements at Novorissk, is estimated at \$9,500,000 or \$55,000 per mile. The line will give an outlet to a productive grain country as well as petroleum. The latter does not depend upon it wholly, as there is now a pipe line sixty miles long leading from the wells to Novorissk. When built it will be possible to ride by rail all the way from the Atlantic to the Caspian sea.

SPANS OF TELEGRAPH WIRE.—The longest spans of over-head telegraph wire in the world have recently been put up by the French authorities in Cochín, China. These are erected across the river Mekong, posts 160 feet high having been placed on each side of the river, at a spot where the width is 2,560 feet, and from these delicious bronze wires—one .04-inch, and the other .055-inch in diameter—are suspended across the stream. Over a tributary of the river another similar connection has been made, 1,670 feet span and more than 114 feet above flood water. The former of these is a span of 0.46 of a mile.

BAD ENGINEERING.—The recently constructed cable road in Philadelphia has thus far proven a failure. The road is constructed through 12 miles of the principal streets of the city, and has cost the projectors \$600,000, but it is estimated that \$1,250,000 more will be required to correct mistakes. When the iron conduits through which the cable passes were laid, iron rods were run through the stringers and bolted to the top of the conduits just below the slot where the grip passes down to the cable under the street. Every change of temperature has been found to affect the width of the slot and hinder the passage of the grip.

USEFUL INFORMATION.

A New Solvent.

What is said to be a valuable preparation in which petroleum forms the chief ingredient has recently been patented in England. The invention relates to the production from petroleum of a substitute for bisulphide of carbon which can be used for extracting oils and autbracine, for dissolving gums, rosins, and analogous substances, for water-proofing, and for vulcanizing india-rubber in conjunction with chloride of sulphur or other vulcanizing agents. To obtain the improved substitute, which is called "vulcoline," the distillate or fraction from petroleum which passes over between the temperatures of 100 degrees and 212 degrees F. or thereabout (the fraction known as spirit or naphtha) is taken and treated in the following manner: To every 100 gallons of petroleum are added from two three gallons of sulphuric acid, with constant agitation, continued as long as may be necessary, in a suitable vessel; it is then allowed to subside, and the liquor decanted from the sediment is run into a still with from one to two per cent of its weight of lime or other dehydrating medium, calcium carbonate or other alkaline carbonates, or oxides of metals capable of removing or destroying any sulpho-oils which may have been generated by the treatment with sulphuric acid. The distillation is conducted without injecting steam or water into the contents of the still. Sometimes before distilling the liquid is submitted to repeated treatment with fresh sulphuric acid until the acid ceases to be colored, or nearly so. As the distillate comes over, the receivers are exchanged as soon as the product which is coming over reaches a specific gravity from about 680 to 690, water being taken as 1,000. By these processes the portions of petroleum unsuited for a substitute for bisulphide of carbon are removed, and considerable economy is thereby effected, both in material and bulk of liquid to be operated on.

How to Judge of Coal.

There are thousands of consumers and coal dealers, says the *Mining Engineer*, who cannot judge of the value of coal. Such parties generally clamor for coal from one seam. The value of market coal, however, does not depend on the seam from which it comes, but rather on the locality and manner in which it is prepared. The more slate that is mixed with the coal, the greater the amount of ash, and the smaller the proportion of carbon. Thus, egg coal, which is usually well cleaned, contains only 4 or 6 per cent. of ash, and 88 or 90 per cent. of carbon, while buckwheat coal, which cannot be well cleaned, contains as high as 16 or 17 per cent. of ash, and only 75 or 77 per cent. of carbon.

It is true that certain coal as well as certain sizes can be cleaned more readily than others, but this depends upon the location and condition of the seams from whence the coal is taken, and not upon the name of the bed. A bed may be found in good condition in one place and not in another. The bed, or even the colliery, from which the coal is taken, therefore, is no criterion by which dealers and consumers should place a value on the fuel. Nor does the degree of luster indicate its value. Bony coal is not slate, but an excellent fuel. Each coal, however, is especially adapted for certain purposes.

The softer and more friable the coal, and freer from slate, the more readily will it burn. The harder the coal the better it is adapted for high heat and pressure. Free burning coals melt or clinker. A red ash coal makes less dust than a white ash. Consequently the Schuykill red ash coal is specially adapted for household purposes, as it burns very readily and makes little dust. Hard white ash coals are best adapted for steam and furnace use. The Lykens Valley coal commands a high price, because it burns with a large flame and soon evolves heat. It is in great demand wherever quick heat is required.

Fir Leaf Wool.

Fir wool is a textile fiber which in Saxony is manufactured out of the needles of the fir tree, the process being partly chemical and partly mechanical. For this purpose the needles are gathered in spring and summer, when they are young and green; old withered ones being unsuitable. They are taken into barns and there dried in a current of air. When dried, they are subjected to a settling and fermenting process similar to that in use for flax. This softens the woody parts and loosens them from the fiber, but the complete separation is only obtained after a lengthy boiling by steam. During this boiling a by-product is obtained in the shape of an oil (fir wood oil), which is gathered and sold to chemists as a remedy for rheumatism and gout, its properties being similar to turpentine. The complete separation of bast and fiber is produced exactly as with flax. The fiber is now passed through a milling machine similar to that in use for woolen cloth, and is then carded and spun like cotton. Generally the carded fiber is mixed with a certain proportion of cotton or wool, and thus a kind of merino yarn is produced, which is worked in the bosery frames into singlets, drawers and stockings, these fabrics being then sold as anti-

rhenmatics and as a preventive of gout. When examined under the microscope the fiber appears as a tube, and striped, as if covered by a fine network. Goods made with this fiber are sold to a considerable extent in Germany, though they are dearer than the ordinary merino goods.

TIMBER FOR WINE TANKS.—Prof. E. W. Hildgard says that redwood is doubtless superior to all except the sugar pine for wine tanks. In fact, the latter is the only pine or fir to be thought of in that connection, since otherwise the wine would speedily assume a turpentine flavor. Such might be acquired even from the knots of sugar pine, so that clear lumber of that kind should alone be used.

In all cases the boiling out of the sap will improve wood for tank or cask purposes; and should be done not with water only, but with a solution of soda, say a pound of sal-soda to 10 or 15 gallons. A good way is to fill the tank with the hot solution and let it stand, covered, for two days; then fill with clean water and let it soak out the sap and soda as long as convenient. No white wine should, however, be made in redwood, as it will yield up color for years, and will also show taste much more than red wines.

UTILIZATION OF BONES.—The value of ox bones is considerable. The four feet of an ordinary ox will make a pint of neatfoot oil. The thigh bone is the most valuable, being worth \$80 per ton for cutting into cloth brush handles. The fore leg bones are worth \$30 per ton, and are made into collar buttons, parasol handles and jewelry. The water in which the bones are boiled is reduced to glue, the dust which comes from from sawing the bones is food to cattle and poultry, and all bones that cannot be used as noted, or for boneblack used in refining sugar, are made into fertilizers, and help to enrich the soil.

MAKING BARREL STAVES.—Many people will be interested to know how the staves of barrels are made in their peculiar bending or curving shape. The lateral curve is made by cutting the staves from a log with a cylinder saw, which looks like a steel drum with teeth all around one end. The lengthwise curve is obtained when edging up the staves by feeding them on a traveling platform, which swings slightly against a smaller circular saw. The bevel edge on the heading is made by locking the boards on a revolving vise, fixed at an angle and running them over a perpendicular circular saw.—*Saw-mill Gazette*.

THIRTY CARLOADS OF STRAWBERRIES.—Thirty carloads of strawberries were shipped from Centralia, Ill., recently, each car containing 500 cases, making a total of 15,000 cases. This is the largest shipment ever sent out in one day, and twice as much as was shipped any one day last year. The amount paid to those employed in gathering the crop was over \$7,000 for the day's work alone. There will probably be in the neighborhood of 175 carloads shipped for the entire season.

GOOD HEALTH.

Resisting Electric Shocks.

Dr. A. L. Hummel recounts some curious cases of recovery from shocks which ought, according to all ideas upon the subject, to have proved fatal. One is that of an employee of the Brush Company, who, while still grasping the wire in his left hand, cut it with a pair of nippers held in the right. The current was at once established through his body and he was held to the wire at the top of a 30-foot pole for three minutes at least, by which time a ladder had been procured and he was released by a fellow-workman. During this time a current of 3,000 volts, or sufficient to run 50 arc lamps of 2,000 candle power each, had apparently passed through his body, yet he was able to reach the pavement with slight assistance, suffered little or no constitutional disturbances, save a slight rise in temperature, and was not confined to his bed. His punishment was limited to the charring of three fingers on the left hand, and a small but deeply-burnt hole in the palm of the right hand. The only treatment was that applied for simple burns. Another case was afforded by one of the workmen of the Bell Telephone Company, who having climbed a pole belonging to the Brush Company, in order to carry a wire over it, grasped the tie wire of the positive line with one hand, and that of the negative line with the other. Here he was held until an assistant ran five squares to the electric light station, when the circuit was broken and he was released. A rope had been attached to him and passed over the arm of the pole. This was held by another man and he was thus prevented from falling. Though unconscious for a while, he soon rallied, but his pulse never exceeded 86, nor his temperature 101°. The thumb of the left hand was burnt nearly off, as were also the index and middle fingers of the right hand. These were all amputated.

CURING RHEUMATISM WITH CELERY.—A German correspondent of an English paper writes as follows: I have had a severe attack of inflammatory rheumatism and was healed in two days' time by a soup made of the stalks

and roots of celery; therefore I desire to make this simple remedy known through the columns of your paper for the benefit of all suffering from gout or rheumatism of any form. I was induced to try it by seeing the following notice: Numerous cures of rheumatism by the use of celery have recently been announced in English papers. New discoveries—or what claim to be discoveries—of the healing virtues of plants are continually being made. One of the latest is that celery is a cure for rheumatism; indeed, it is asserted the disease is impossible if the vegetable is cooked and freely eaten. The fact that it is always put on the table raw prevents its therapeutic powers from being known. The celery should be cut into bits, boiled in water until soft, and the water drunk by the patient. Serve warm with pieces of toasted bread, and the painful ailment will soon yield. Such is the declaration of a physician who has again and again tried the experiment, and with uniform success. At least two-thirds of the cases named "heart disease" are ascribed to rheumatism and its agonizing ally, gout. Small pox, so much dreaded, is not half so destructive as rheumatism, which, it is maintained by many physicians, can be prevented by obeying nature's laws in diet. Here, in Germany, we boil the root and stalks, as the root is the principal part of it, and afterward eat it as a salad with oil and vinegar. I received such immediate benefit that I am anxious to let all the rheumatic sufferers know of it.

The Approach of Age.

The approach of age shows itself about the eyes. Lines come, faintly at first, then deeper, until the incipient crows' feet are indicated, developed and revealed. The woman who, looking in her glass, sees these fatal lines, diverging from the outer corner of her eyes, knows that she has reached an era in her life. She recognises it with a sigh if she be a vain, a lovely or a worldly woman; with a smile, perhaps, if she has children in whom she can live her own youth over again. But it can never be a gay smile; none of us, men or women, like to feel youth—that precious possession—slipping away from us. But we should never be seen on the lookout for crows' feet or gray hairs. Looking for them is sure to bring them, for thinking about them brings them. Tears form a part of the language of the eye, which is eloquent enough when sparingly used, and which should be sparingly used for other reasons than that of adding to their mute eloquence. Tears are a disfiguring expression of emotion, and those who get in the habit of weeping over every small vexation do much to acquire a careworn, miserable expression, and are sure to look old before their time. Excessive weeping has been known not only to injure but actually to destroy the sight. Few women look pretty or even interesting in tears, though it has long been a pleasant fiction in poetry and romance to suppose that they do. Many women, some men, most children, make most disfiguring and distorting grimaces while crying; and the lady who thinks she can work upon a man's feelings by a liberal display of tears, should carefully study a becoming mode of producing them before her looking-glass. Grimaces soften no heart, and tears, accompanied by the usual distortion, have a hardening effect if not a visible one.

In a prettily written work, now probably out of print, purporting to be the story of the life of one of Milton's wives, the author makes the poet say of his wife's eyes, after crying, that they resembled "the sun's clear shining after the rain," a very pretty natural object indeed, but during the rain itself the observer is not inclined to be complimentary.—*Whitehall Rev.*

DEATH FROM INFECTED WOOL.—A sad case of death from infected wool is reported from Neuttschein, in Moravia. Herr A. Perl, a woolen manufacturer of that place, became troubled on the 7th of January with a swelling on the upper lip, which he attributed to a cold that he had been suffering from. But the next day symptoms presented themselves which caused the physician in attendance to suspect with tolerable certainty that it was a case of diseased spleen—a frequent complaint among animals, though seldom met with in man. The physician's diagnosis was strengthened, when he was informed on making inquiries that Herr Perl had on the previous Sunday examined a sample of wool that he had received, by smelling at it several times. Shortly afterward the patient experienced a burning under the nose, and there remained no doubt that the sample of wool had come from a diseased sheep, and that he had been infected by it. This would happen the more easily as he had been suffering from a cold, and the poison would be readily taken into the circulation, through a slight injury of the mucous membrane. The disease was rapidly developed, and Herr Perl succumbed to it on the 9th of the month.

ATTENTION TO DETAILS.—The *Herald of Health* suggests that health, like success in life, is to be gained by paying attention to details. It is better to try to keep from catching cold than to be always trying to avoid infection. More can be done to check cholera by keeping houses clean than by using tons of disinfectants. Nature gives health. It is man's perversity in departing from Nature's teaching that leads to disease. Nature intended all to have fresh air, sufficient plain food, uncontaminated water and exercise. Let us accept Nature's bequest, if we prefer health to disease.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

POCKET.—Amador Ledger, June 27: We were shown last Saturday some very rich specimens from the St. Julian, taken from a small pocket in up-raising, not far from the surface. A gentleman named Oliver was in Amador City last week negotiating for the purchase of the Little Amador mine. A cave occurred last week in the south shaft of the Gover, which has caused the stoppage of the mill for the past week and laid off a number of miners. The cave is not serious, however, and everything is expected to be in good running order again in a few days. At the North California the tunnel is in a distance of 500 feet. Small bodies of quartz have been cut, but the main ledge is believed to be 250 feet beyond the present termination of the tunnel, and to reach this ledge is the object of the tunnel operations. A contract for 200 feet was let about six weeks ago which will give the tunnel a total length of 650 feet—from 50 to 100 feet short of the point where the ledge is believed to be. The surface croppings show an immense body of quartz 300 feet in width, which yields from \$3 to \$5 per ton at the mill, which will leave a margin of profit if extracted by means of a tunnel. The ore body in the upper Mammoth tunnel has widened considerably of late. There is now a large ledge of good ore. It is somewhat singular that this fine ledge should be within ten feet of the point where a prospect shaft sunk many years ago was abandoned. It was the same with the rich strike in other parts of the claim. They were met with only a few feet from where the former claimants had quit work. The small engine at the Mammoth mine has been moved to the Moore mine, and is being used in hoisting water. The water is very strong, and the work of lowering it proceeds slowly. At present the water level is below the first tunnel, at the depth of 130 feet from the surface. Mr. Nevills went through this level Wednesday morning, and found the shaft and tunnel in good condition, in fact almost uninjured. There is over 100 feet of water yet to be taken out. W. A. Nevills has bonded the Bright Quartz mine, in Schober's field, also 1000 feet along the ledge on Schober's ground. It is the intention to prospect the claim at once. The engine formerly on the Moore mine is to be placed in position on the claim. The bond runs for one year from the 1st of July next. The 20 stamp mill on the Amador Queen mine will be started to-day, Saturday.

Calaveras.

MORE RICH ROCK.—Calaveras Chronicle, June 29: Fortune is surely smiling upon our local banker, Mr. C. Schlund, in his mining operations, and the indications are that the Dame's countenance will soon be radiant with signs of encouragement and reward. Last Wednesday we were shown more exceedingly rich rock. At a depth of one hundred feet the quartz vein is fully two and one-half feet in width. The evidences are that the Tiger mine is not only rich but will be a permanent paying mining property. Mr. Schlund has recently purchased a small quartz crushing appliance for prospecting purposes, which is very effective in reducing the rock to a fine powder. It is easily worked with one hand by means of a lever, and is superior in every way to a mortar.

ANGEL'S CAMP.—Business of every character is improving, and the drowsiness that prevailed is being cast aside as wealth is taking the place of poverty. Capitalists are now investing their money in this section, and many rich mines in and about this vicinity that have been dormant for many years are now being developed by those who have the capital, and thus everything looks flattering. The once famous Big Mine, but more recently known as the Potter mine, has lately changed hands, and the new owners have commenced work in good earnest. A force of men are now grading for the new hoisting works, and it is the intention of the owners to sink the shaft 500 feet deeper. A large boarding house will soon be erected on the ground. The mine will give employment to at least fifty men when everything is in working order. It is said that our genial friend, Uncle Jim Tullock, has taken the contract for erecting the new works to be placed on the mine. The Compact Mills erected by him on the Lane and Cherokee mines, and which run like clock work, speaks well for the ability of our friend in that line.

Inyo.

MAXIM MILL.—Inyo Independent, June 26: Yesterday morning Harris & Rhine took possession of the Maxim mill, and placed Sam Gruher in charge as keeper. It is claimed that the sale of the property to William Stansfield last December was not based upon sufficient authority, the notice under which the judgment of sale was obtained not having been served upon parties who were representatives of the real owners. For the purchase money invested by Mr. Stansfield he will doubtless fall back upon the seller. This mill is a regular Pandora's box, every time it is opened some new trouble springs out. Under the management of Mr. Stansfield it gave promise of being a success for himself and a benefit to the country; it is deeply to be regretted that any hindrance should come in his way.

GAVILAN.—Last Thursday a run was started on fifty tons of ore from the Gavilan mine. This ore is from the same ledge as the Chulula, and is similar in character except carrying more sulphurets. One-fifth of the entire mass of this ore is sulphurets and as assayed by Professor Price, of San Francisco, the sulphurets contain \$29 per ton of gold and silver, nearly the whole value being gold. These sulphurets will be shipped to San Francisco for reduction. In the upper tunnel of the mine a strike of very rich ore was made on Friday of last week. These two mines give every evidence of developing into a valuable property, the amount of ore being immense and the facilities for working all that could be wished.

CHULULA.—A clean up was made last Monday from a run of 37½ tons of ore, the yield of bullion was 108 ounces worth \$14.50 per ounce. This

makes the ore worth, in round numbers, forty dollars per ton.

Mariposa.

PUSHING AHEAD.—Mariposa Herald, June 29: The work of development in the Buckingham mine is being pushed ahead by Superintendent Hall night and day, and the tunnel which will tap the vein at a depth of 200 feet and obviate the necessity of handling the ore more than one time will be completed by the 1st of September, if the ground continues favorable as at present. The mill will then be started and run regularly. B. M. Collins of Lewis District was in town last Wednesday, and from him we learn that the Green Mountain folks last Friday completed the tunnel that taps the vein at a depth of 500 feet and that very rich rock was found. It assayed \$11 in copper, \$40 in silver with traces of gold. The ledge is nine feet wide and the owners are much elated at the prospect.

Placer.

FOREST HILL.—Placer Herald, June 27: Late developments on the Forest Hill divide have given to that region a new life. Much prospecting is going on and in many of the older mines the working force is being increased. The May Flower cleaned up over 50 pounds of gold again on Monday. That portion of Placer county is now undoubtedly the liveliest mining region in California.

Plumas.

INDIAN VALLEY MINE.—Greenville Bulletin, June 27: The water is now out of the Indian valley mine, and a contract has been let for the new hoisting and pumping machinery; also a contract for placing it in position. The tunnel will connect with the shaft in a few days, where an excavation 3x18x10 feet will be made for the plant of the new hoisting works, which will be 400 feet under ground. An eight-inch pump will be put in to pump water from the 200-foot level. The water from the bottom of the shaft will be pumped into a tank at the 200-foot level; also the water from the Union, which is being tapped by a tunnel, 212 feet below its deepest workings, will be drained into the same tank and pumped from there into the drain tunnel above. This arrangement will enable them to handle the water easily, thus facilitating the sinking of the shaft.

Sierra.

THE BUTCHER RANCH MINE.—Sierra Tribune, June 26: At the above quartz mine, owned by Messrs. Van Slyke and Maxon, the wagon road leading from the mine to the mill is completed. Grading for the mill site is being prosecuted vigorously. Twelve carpenters are being busily engaged in framing timbers for the 10-stamp mill. Three 60-foot shafts have been sunk at different points on the vein and a drift run that connects each of these. The ledge varies from 5 to 12 feet in width and carries free gold in abundance. We understand that Peter Vuossavich, of Sierra City, will act as foreman at the mine.

ATTACHED.—Mt. Messenger, June 27: The Marguerite property has been attached by creditors in San Francisco for the sum of \$72,000. The property has cost a large sum of money in its development, and as the mine is valuable it will probably be redeemed. Chas. Hartling and Louis Garibaldi have put up an astra at the head of Coyoteville ravine, and commenced grinding the sand from the old Jas. Code quartz mill that prospects rich. After this sand is exhausted, quartz will be crushed that promises to yield large returns.

POKER FLAT ITEMS.—Your correspondent visited the Sierra Phoenix mine, owned by Chas. Southerland, J. E. Linsey and G. P. Dorland, whom he found with seven men busily engaged putting up a Huntington mill, about one-eighth of a mile above Empire Flat on Canyon Creek. The ledge lies between slate and serpentine rock. The mill is being constructed by Mr. Mathews, of San Francisco. J. Z. Hough is doing the carpenter work. There is about 2,000 tons of ore in sight. A good deal of rock-gold can be seen with the naked eye, which will average \$30 per ton with a cost of \$2 per ton for milling. In the main tunnel as high as 50 cents to the pan can be obtained. The ledge can be traced 1,750 feet on the surface, and is about seven and eight feet wide. The quartz is run through a chute, emptied into a car, brought to the mill, a distance of 70 feet and then thrown in the dump. A rock-breaker is attached to the mill. The mill will run from 10 to 12 tons per day. The cost of this mill will be about \$2,500. It is also run by a Pelton wheel three feet in diameter. The water is purchased this summer from Mr. Chas. Scott. It will give the mill about 250 feet pressure. The company expect to put up a 10-stamp mill in the near future, and will then bring the water from Canyon Creek, a distance of three-quarters of a mile. It is thought that this is one of the best ledges around Poker Flat. Copper plates are used.

Trinity.

LOOKING WELL.—Trinity Journal, June 29: We learn that the After-All mine, on Mule creek, in Minersville District, is looking remarkably well. Much paying quartz has been taken out and there is a good body in sight. Five men are employed at the mine.

DEADWOOD.—Most of the discoveries made are in abandoned mines, reopened by energetic men who make further developments and are rewarded with the glittering gold. Others are prospects found sometime in the past on the surface which were small, but being tapped to a good depth by tunnels have displayed large bodies of rich ore. Mr. William Blagrove and John E. Gibson, on the extension of the Black Bear, have struck their ledge with the lower tunnel and shows up a vein two feet in width which prospects over \$100 per ton. Nearly every piece of ore upon the dump shows free gold. Westlick and Cosgrove have also struck an immense thing. The lode is from 8 to 20 inches in width and prospects up into the hundreds. McDaniels has struck a small rich vein on the Enterprise location. He is hard at work and in a few weeks you will hear from him again. Mr. Stone has also struck a rich prospect. Mr. C. Blakemore has struck it as rich as ever in the Venetian mine, on Jennings gulch. Gibson and Wm. Leavett are taking it out in handfuls, from their small vein which has widened out to 10 inches. Bothsby & Hendricks, who have leased a mine from Mr. Denison came down with a spoonful of gold the other evening. The boys report having struck it rich.

Tuolumne.

BRIEF NOTES.—Union-Democrat, June 27: Long

& Hampton have been forced to temporarily shut down the Willaeta mine on account of lack of water. It will be started up again as soon as water can be had. The new hoisting and pumping machinery is being put rapidly in position at the Dead Horse mine. The last of the machinery arrived from Amador county last week. Some very high grade sulphurets are being taken from the Hyde mine. The vein is of good size, and improves with every new development. J. N. Gillis has been crushing some good rock in his astra near Tuttle town. The Sulphurets mine is working steadily with a large force. The mill is making steady runs, with satisfactory clean-ups. Gus. Wiedekind is doing well in his gravel claim at Pine Log. He was in town a few days ago, and exhibited a nugget weighing several ounces. We understand that San Francisco parties will soon begin to open up one or two mining properties at Sugar Pine.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, June 27: Sinking the winze from the floor of the 3,000 level to explore the ore body deeper was commenced at 11 A. M., day before yesterday. The first or commencement set of timbers were put in place and the winze is now down about seven feet, all in high grade ore. It is being made to follow the dip of the ore vein at an angle of about 65 degrees, and is being put down as a double winze, with two compartments, one 5½ and the other 4¼ feet in the clear. The sinking or hoisting will be done for the present with a hand winlass, or until an engine is required. The ore taken out in sinking the winze is raised to the surface and shipped to mill, and as to the grade of it, as before stated, car samples average from \$80 to \$100 per ton. Yesterday noon, in order to ascertain the merits of the report that the face or bottom of the winze was in porphyry, superintendent Keating, accompanied by superintendent Hamilton, of the Chollar, went down and personally took the samples from both ends and both sides of the winze, which were assayed at the assay offices of the respective companies—four assays each. Keating's went from \$116 to \$590 per ton, and Hamilton's from \$55 to \$321 per ton. It is fair to presume, however, that they selected better than the average of the ore in sight, and certainly a candle box full of it, which this reporter saw at the office of the Hale and Norcross Co. would go nearer \$1,000 per ton. According to these eight assays as well as others taken the regular Comstock proportion of the precious metals is maintained in the ore thus far taken out of these lower grade levels—three-fifths silver to two-fifths gold. Meanwhile, the chambering out for the surface machinery and hoisting frame of this winze is proceeded with.

CHOLLAR.—Nothing is being done on the 300 level at present. Superintendent Hamilton deeming it advisable to suspend operations at that point until the new section of the big hydraulic pump is placed in proper position. This will take about six or eight weeks. Its foundations are already prepared and everything else in readiness for receiving it when it arrives, and it will be placed where it belongs and put into active working operation as soon as practicable. When this is done, it will simply be the other half of the big pump already in and working, practically doubling the present drainage capacity of the pump.

CON. CALIFORNIA AND VIRGINIA.—The repairs to the C. and C. shaft being completed, ore extraction from the 1,750 level, on company account, goes ahead as before, yielding about 90 tons per day. The quality of the ore shows considerable improvement, average assays being over \$25 per ton. About 100 tons per day come from the old bonanza section above the 1,300 level under the Jones' contract; average assays about \$13 per ton. The old ore sections and stopes throughout the mine show no sign of exhaustion, and bid fair to yield low grade ore for years to come.

CROWN POINT.—The ore stopes in the old bonanza workings yield about 350 tons per day, and the Belcher, which is being worked through this mine, yields from 100 to 150 tons a day, all of which is reduced at mills on the Carson river. Kentucky yields about 50 or 60 tons a day, which is worked at the Rock Point mill, just below Dayton, on the Carson river. All this ore from the three mines mentioned is of low grade, being the leavings or gleanings of the old high grade bonanzas which were worked out years ago.

SIERRA NEVADA.—On the 520 level the main lateral drift is being steadily advanced in favorable working ground. During the past week it has been advanced 67 feet, giving it a total length of 638 feet. As before remarked, this drift runs nearly in a northerly direction, diagonally across the ore channel, this being practically a cross-cut as well as a lateral drift. It will thus eventually skirt into the ore veins lying to the west, if it is continued on its present course.

ALTA.—The upraise above the 950 level has reached the 800 level, and the drifts and explorations from following up stringers and bunches of ore have not yet developed a rich bonanza. Small quantities of pay ore continue to be extracted and saved for milling, only one shift of miners being employed.

MONTE CRISTO.—This old mine situated in Six mile canyon, continues to yield about 6 tons per day of low grade ore, yielding \$10 or \$12 per ton, which is reduced at the Empire State mill. It is free milling ore, and the mill close at hand, otherwise it would not be made to pay.

BULLION.—Water coming into the west drift on the 160 level impedes progress considerably, all the hoisting being done with a whim. The face of the drift is in very favorable looking vein matter—porphyry, quartz and clay.

YELLOW JACKET.—The low grade resources of this mine, from the 1,100 level up to near the surface, seem to be practically inexhaustible. About 300 tons per day is the average daily yield, most of which comes from about the 400 level.

GOULD AND CURRY.—On the 1,000 level the 1st. from the main lateral drift, and is making good cross-cut east, near the average line, is now in 136 progress in favorable working ground. The joint west drift is in about 300 feet.

OVERMAN.—The yield from the stopes of the 226 level and above it has been increased to about 50 tons a day. It is all low grade ore, and is shipped

to the Vivian mill on the Carson river for reduction.

OPHIR.—On the 500 level the upraise to connect with and drain the old Mexican shaft made 20 feet of progress upward during the past week, and will probably be completed in two or three weeks more.

UNION CONSOLIDATED.—The joint Union and Mexican lateral drift north on the 500 level is being steadily advanced in good working ground.

WOODVILLE.—Still yielding 12 or 15 tons per day of good grade ore from the 400 level and stopes above it.

MEXICAN.—The joint Mexican and Ophir east cross-cut on the 500 level is making the usual good progress.

Castle Dome District.

LOOKING WELL.—Silver State, June 23: Wm. Rodifer, who discovered the rich lead in Castle Dome district is in town. He says the mines which are being worked look well. Luther & Bauman have a large streak of fair ore in their vein at a depth of 64 feet. Himself and partners have located three or four claims, which are considered good prospects. They are working some 400 feet from where they found the very rich ore and have a lead from two to three feet thick. They recently shipped a lot of ore to Utah which worked over \$1,600 per ton, but though there are rich streaks in the leads they require capital to develop them.

Tuscarora District.

NORTH BELLE ISLE.—Times-Review, June 26: North drift, 150-foot level, has been advanced a total distance of 208 feet. No change to note.

BELLE ISLE.—Cross-cut west, 350-foot level, advanced eight feet the past week; total length 84 feet. Drift north, 150-foot level, advanced 10 feet; total distance 100 feet.

NAVAYO.—Drifts and cross-cut on the 650-foot level has been extended 67 feet the past week. Cross-cut on the 350-foot level advanced 96 feet by the power drill. Good progress made with the work at all other points. Will close down this evening to clean boilers and make a few other necessary repairs.

GRAND PRIZE.—The south drift on the 200-foot level has been extended 30 feet during the week, the 300-foot level 27 feet and 400-foot level 22 feet. Stopes are producing the usual amount of ore. The mill is running all right. As most of the ore that is now extracted it manganese and sulphurets, it will be necessary to roast it. Will commence roasting in a day or two.

Willow Creek District.

BOOMING.—Silver State, June 23: The most important ore body ever encountered in the Ohio mine was struck early last week, and up to latest accounts was steadily improving. At the Wild Deer they have just completed the No. 1 tunnel, which opens up 240 feet of stopes and exposes over 1,500 tons of ore. The mill only waits to get the ore bins full before starting up for a long and prosperous run. The irrepressible Ed. Lucas comes down from his mountain cabin once in a while, with a fresh location each time, and his pockets full of the "biggest things on earth." If there is anything in this range, from Buckskin mountain to Castle Dome, Lucas is bound to get it. Old Pete Cassidy is delving away at the Democrat. He has uncovered a large ledge of gold quartz, which runs as high as \$27 a ton in gold. Pete swears that he has 10,000 tons as good as that, and thinks that under the present administration he ought to have the best kind of luck. Up the creek, the old prospectors pursue the even tenor of their way, digging a little, growing a good deal, and, as usual, predicting the failure of every other enterprise except their own pet holes in the ground.

COLORADO.

OPHIR NOTES.—San Miguel Journal, June 26: F. J. Kramer, who leased the Tidal Wave property for one year, has just set four men to work. As the men will commence work on ore it is probable that Mr. Kramer will realize a snug sum from his lease. Mr. James, representative of the Pasadena smelter, is in town bidding on the ore in this vicinity. The Bernier boys of the Silver Belt were in town on Sunday, and report that they have a tremendous heap of ore as the result of their winter's work. Douglass & Gillan, leaser on the Parsons, have struck a fine body of gray copper and chloride ore. Jack Simmons is working the Joogin, a good lode. It is reported that he has taken out some very fine ore within the last ten days. Mr. Simmons is also the owner of other valuable property situated in the vicinity of the Caribou mine. General M. J. Alkire has struck it rich on the Suffolk, a valuable gold lode situated on Silver mountain. The pay streak is over two feet wide and will mill-run over \$100 to the ton. The General will certainly be a rich man by fall. Tom McManus, leaser on the Fulton, will soon commence shipping ore. It is reported the Fulton is booming and looks away up. It is reported that the machinery for the stamp mill of the Hildebrand Mining Co. is on the cars in Denver.

BREFFS.—San Miguel Journal, June 26: The Cimarron is shipping daily, to the Pandora mill. The Flora has shut down for a month or so until the snow is off. The melting snow making surface water faster than it can be taken from the shaft by hand. In the Medota the finest body of ore was struck the first of the week that has ever been found in Marshall basin. Brittle and ruby silver abounds in the ore. The Smuggler is now shipping regularly. The Bell mill will concentrate the low grade ore. The Sheridan has its entire force at work shoveling snow, opening the trail to Silverton. The Boomerang continues to hold its own, and is shipping steadily. The Silver Glade is steadily improving as development progresses. It is now yielding some fine ore. Several valuable locations have recently been made, in the vicinity of the Boomerang and Silver Glade. The machinery at the Gold King mill, is in place and the mill will be started on the season's run early the coming week. John Real, one of the owners of the 76 in Marshall basin, informs us that this mine will be worked this season. It is good property. The J. W. Jr., of Marshall basin is shipping ore. The Argentine will remain idle this summer. The management announce that the mine will not be worked until they can put on pumping machinery.

IDAHO.

BANNER NEWS.—Idaho World, June 26: The

Silver Chief Company's new shaft was started on the 19th. Part of the force at the Golconda mine, consisting of Robbins, Davis, Hladley and Granger, were moved over for the purpose above stated. Thus begins work on a mine that has given good grounds for great expectations, and everybody would rejoice to see it first on the list by proving to be the biggest bonanza in Boise county, which is not at all improbable. The shaft is in a beautiful location two hundred feet west of the Elmiria company's line, and fifty-six feet south of the vein on the surface. Mr. Munron says he expects to strike the ledge on the 280 feet level of the Elmiria company, and from that point down one hundred feet the vein stands about perpendicular, judging from the Banner shaft. The dimensions of the shaft, which is compartment, are 4x8 feet in the clear. It will take some time, and cost probably \$5,000 to put this mine in good shape to pile out ore. The Elmiria company is now taking out plenty of ore from the Banner, and of very high grade. Every one who has examined the mine says the ore will mill between \$150 and \$300 per ton.

THE CALIFORNIA DITCH.—Every effort is being made to have the water in the California ditch running to Dream Gulch by Monday. On Tuesday ten peddlers were employed along the line and the water had been coaxed down to Reeder Gulch. Yesterday ten more men were put on to hurry the water forward, and if no breaks occur it should be on the point above Murray today, as all the fluming this side of Gold Run was to have been finished last evening. A stretch of fluming rock work is necessary along Alder Gulch, but the entire force of carpenters concentrated there to-day and the woodwork will be done by Saturday. The rock part is in the hands of John Treglone, who has a contract for the entire job and he was to have put twenty men to work yesterday. This is also to be completed by Saturday. Preparations on an extensive scale for using the water are being made by the Tiptop and Freeman claim owners. The former are setting boxes, and as soon as the flood comes along three eight-hour shifts will be put on to do as much execution as possible. The owners of the Freeman claim propose to apply hydraulic power if it can be arranged. Both claims have been promised water until it can be used in Dry and Dream gulches, and if the supply is ample they can obtain it right along. If not, they will be shut off. But it is expected that a large amount over and above what Dry and Dream gulches will use will be carried in the ditch. The charges are told, though not officially, will be 50 cents an inch for the present for 24 hours, but we presume the water will also be sold for specified hours during the day to give all the claim holders below Gold Run which the ditch reaches a show. The ditch down to Gold Run is said to have cost \$17,000, and even this large outlay may be increased some when all the figures are carefully summed up.

THE OUTLOOK IMPROVING.—Wood River Times: The local mining outlook has brightened considerably, during the past two weeks. The gold mill has proved to be a success, and this insured the exploitation of many claims along the gold belt that have never before been worked; another bonanza has been uncovered in the Elkhorn, and in the lowest levels at that; at Bullion work on the "King of the Hills" group has been resumed, the new owners intending to extract every pound of ore possible while keeping the development work well in hand; the Queen of the Hills (which, by the way, is opened to a greater depth than the Bullion vein, even) is steadily improving and showing a width of six feet of solid galena; the Idahoan is producing as much ore as ever; and there has been half a dozen promising strikes in the Alturas, the Mayflower, and other claims. Altogether, the condition of our mines is much better than it was a month ago—there is much more ore in light, and a larger number of men employed. If ore could only be struck in the Bullion Ohir tunnel now, every one here would feel better, and half-a-dozen other tunnels would be commenced.

A NEW SHAFT.—Cour d'Alene Sun, June 26: Stillwell, Page and Beauchamp, who have taken a lease of the deep ground of the Pacific claim, yesterday commenced work on a new shaft on Gold street, above Second. The hole will be 15 by 35 feet, but only 15 by 19 feet in the clear, the wheel and pump being expected to take up 16 feet. It will be remembered that the owners of the Pacific claim made an attempt to prospect the deep ground through the old shaft last Fall, but after running a drift some 40 feet or more from the shaft gave up the work. Bedrock was followed a few feet from the shaft, but it suddenly pitched down to such a depth that it could not be traced. The drift was continued in gravel in the hope of encountering it again, but it was not struck until a channel of about 35 feet in width had been crossed, when the water became so troublesome that work had to be suspended. All through along the drift the gravel prospected, but no pay dirt was found. The owners now propose to go to bedrock in the deepest ground encouraged by the pay found in the combination shaft a quarter of a mile below. The work of sinking will be prosecuted with energy.

A BEDROCK FLUME.—The Alder Gulch bedrock flume is progressing nicely, and on next Monday the company expect to shovel pay dirt into the sluices. An immense amount of work has been done, and the cut to reach bedrock, which was struck last week, is in the neighborhood of one thousand five hundred feet in length. A mammoth pit, 60 feet wide is now being ground-slued down to within a foot of bedrock. Owing to the running down of the water a reservoir has been made in the upper part of the gulch by damming up some of the old shafts, drifts and drains, which was easily done, and when the gates are opened a perfect flood is let loose, which with a fall of 18 and 20 feet does splendid execution. By this method an hour and a half's sluicing is secured five times a day. Immense boulders are met with and give a great deal of trouble, but the company is satisfied with the advance they are making, and believe they are in sight of the reward for their hard work. If a similar enterprise were started in Prichard Creek by a combination of several claims we would soon have different times in the camp.

GOLD AT SOLDIER.—A letter from Camas Prairie states that the ranchers in the vicinity of Soldier are wild with excitement over the recent discovery of gold-bearing veins on the north side of the Prairie. Road Supervisor Samson, a few days ago, picked up a boulder in which he found a nugget

worth \$5. The finding of this "float" started Pitt Smith and others prospecting, and Mr. Smith soon found and located a vein on Lisle's ranch, above Abbott's. Another vein was found near Upper Soldier creek, above Samson's place, another on Howell's place, and a fourth on an adjoining mountain. All the ranchers who can get away are in the hills, scouring the country for ledges.

THE STRIKE IN THE ELKHORN.—The recent strike in the Elkhorn mine is proving of very great importance, the ore-vein showing a width of over 18 feet, of which 10 feet is solid galena. The strike was made in tunnel No. 2, and not very far from Parker ground. As even the second class ore of the Elkhorn has always averaged 90 to 100 ounces, there is every reason to suppose that the ore recently struck will average at least 150 ounces per ton. The management, possibly made wise by experience, has concluded to extract only 10 tons of the ore per day, and to endeavor to keep the dead or development work well ahead of the stopes.

ANOTHER CLEAN-UP OF THE GOLD MILL.—Wood River Times, June 26: The Camas No. 2 mill was cleaned up for the second time yesterday. Somewhat better results are anticipated than at the first clean-up, as the mill must be getting down to steady work.

MONTANA.

PROGRESS OF OPERATIONS.—Inter-Mountain, June 26: While Mr. C. N. Laramie, owner of the Mountain view, is not at present extracting from the mine a large amount of ore, he is systematically developing the property and putting it in shape to rank with the heaviest producers of the district as soon as the copper market shall revive. On the 500 foot level operations are confined to the extension of the east drift on the north vein. The face of the drift is now 350 feet from the cross-cut, in workable ore all the way. The extent of the ore body is unknown, as neither wall has been touched. At a depth of 600 feet on the south vein the east drift has been advanced 125 feet and the west drift 115 feet, all in ore of mixed grades, some of it requiring concentration. On the north vein the 600-foot level has penetrated the ledge for a distance of 225 feet east and 250 feet west. In the east drift 100 feet from the main cross-cut a second cross-cut was extended to the foot and hanging walls, showing them to be 17 feet apart and the space between filled with good ore, varying in value from 12 to 70 per cent, every pound of it being susceptible of profitable treatment. The dump contains 12,000 tons of second and third class ore. Some first class ore is being shipped to Butte.

MOULTON.—The Moulton is reported to be in fine shape on the middle and lower levels and the company now proposes to make some extensive explorations at the depth of 500 feet on the big south vein, which has never been fully explored, and which in the east end of the claim was proved by a cross-cut to be 60 feet wide. This will be accomplished by means of the diamond drill owned by Mr. Clark but which for some time past has been in use at the Bell mine. The old veins of the Moulton are being developed, some of the ore being extracted and some left in place as a reserve. The mill is working steadily, and is perhaps doing the best work in the camp. The bullion product averages \$50,000 per month.

LEXINGTON.—In order to facilitate the successful treatment of Lexington ore, which is now very base in the lower levels, an addition to the mill has been started in which it is proposed to roast the ore more thoroughly. The result will be a much higher percentage of amalgamation and a corresponding increase in the bullion product. Nothing new is known to have been recently developed in the 650-foot workings, where the main ledge is being actively explored. The sinking of the main shaft will be resumed the coming week, and quick work is promised with the Ingersoll drills. The air compressor, which was made to special order and is a magnificent piece of machinery, works to a charm.

ELM ORLU.—The Elm Orlu, upon which an important surface strike was made some weeks ago, has now assumed a value as a permanent ore producer. From the old shaft south of the strike and at a point 60 feet from the surface a north cross-cut was extended to the ledge, a distance of 60 feet. The ore body was found intact and is 8 feet wide, most of it assaying 50 ounces in silver. The ore production of the property is 15 tons daily.

BELL.—The Bell is yielding about 30 tons of ore per diem, enough to keep one stack at the smelter supplied. It is extracted chiefly from the 500-foot level opened by a winze from the 400 level on which a pony hoist has been placed. The mine is said to be looking exceptionally well. The smelter product assays 50 percent and about 50 ounces in silver.

NEW MEXICO.

GOLD HILL.—Silver City Enterprise, June 26: Our camp just now is beginning to attract considerable attention from mining magnates. Scarcely a day passes without the arrival of individuals or letters of inquiry as to our mineral resources. Thus far all who have visited the camp speak in glowing terms of our future greatness, and predict for us a permanent position in the list of bullion-producing camps in Grant county. As yet but little work has been done on the majority of the claims in camp, but with the development already made the showing is certainly one to be proud of. Homestead is advancing rapidly, 20 feet having been made during the week. The rocks get harder as depth is attained, and progress is somewhat retarded. Everything thus far has worked smoothly, and if no unusual accident occurs the contract will be nearly completed this week. Standard continues to produce an unusually fine grade of ore, extracting about one ton of closely assorted ore a day. The returns from a shipment of two tons made last week have not yet been received, but will go about \$80 per ton. Tracure Box resumed work last Monday after an idleness of several months. As far as developments have gone the owners have every reason to be pleased with the outlook. Free gold is occasionally found, and a stratum of galena ore has made its appearance in the shaft. Operations will be commenced on the Grand Tower about July 1st. Work will be prosecuted with vigor, and the ultimate result is sure to be satisfactory.

WATER CANON DISTRICT.—A, Hogwall & Co.

are working without cessation on the Northern Light, in the north branch of Water Canon. They will perform ninety additional feet of work under the present contract. The property bears a very promising appearance. We were shown a day or two since a quantity of fine looking concentrates secured from the average ore now being dumped from the mine, which will be analyzed at the Billing works laboratory. This claim bids fair to call for a concentrator before many months expire. It possesses all the facilities of water, wood and transportation. The L. V. & St. L. M. & S. Co. are improving rapidly the appearance of the Tonto, a good claim situated south of the Garfield and Star of the East. It is now affording good-looking lead, copper, iron and silver. The steady exploitation of the Jane Bowman continues. There is no need of development on this claim, as the boys have only to quarry gold mineral out of a 50-foot ledge. It is not a mere rumor, but a fact, that steps are now being taken to commence active work in the Clipper mine, and also to erect a concentrator for the treatment of its ore.

LADRONE DISTRICT.—In Thwaites, Barduhn & Co's Picotite mine we note a remarkable improvement this week. Shaft No. 2 is forty feet in depth, and at this point their lode is three feet wide and consists of iron quartz gangue, bearing sulphide of silver. This mineral is exceedingly rich; it is not dumped at all, but stored up for shipment as it is extracted from the bucket. Whitacre & Hudson are steadily going down upon a full face of chloride and sulphide ore, in the Florence mine. The dump is increasing rapidly. Shaft No. 1 has reached thirty feet; the other workings also display the same character of mineral, and they are sacking ore for shipment. Thos. Dorsey, Henry Lockhart, Lindsay Henson and Thos. Dwyer have purchased the Reserve mine, in the Ladronne mountains, of Donald McRae, and the developments which they are to commence at once are to be superintended by Thos. Dwyer, the well known mining man. The Lawrence is keeping up its reputation as a producer of rich chloride and sulphide ore. Work upon the property continues without interruption, and the ore is sacked and stored for the market.

MAGDALENA DISTRICT.—Socorro Bulletin, June 26: The Hardscrabble mine is in full blast in charge of Wythe Walker, superintendent. The cars are running on the tramway, and convey fifteen tons of mineral daily to the chute. This quantity, however, will be materially increased as soon as the new machinery and upper drum arrives. Mr. Walker, in a drift leading from the tunnel, has succeeded in intersecting a new body of exceedingly rich iron and silver ore, which is well fitted for fluxing purposes. The mine is worked by full day and night shifts; the mineral is drawn from the openings only, as stoping has not been inaugurated. Shipments from this mine commenced last Tuesday. Wythe Walker has commenced working in the Zoe mine, at the north end of the Magdalena mountain. The mineral consists of free gold in iron quartz gangue. He let a 50-foot contract on Sunday, and work began the following day. The Ambrosia under the superintendency of Mike Dolan is making a fine record. A visible improvement in the character of the ore has taken place.

ORGAN.—Cor. Socorro Bulletin, June 26: The Bennett mine is looking first-rate. Mr. Skidmore has three shifts at work, and daily shipments are made to the Las Cruces smelter. A few days since the miners broke into an immense cave, which follows in on the vein for 250 feet. This beautiful cave is lined with white crystals, and is said to be a most wonderful sight. Not only is this enchanted chamber a thing of beauty, but it is also of great utility to the owners, as with a little work it will be an actual development of the mine. Of this, more anon. For the present the cave is closed to the public.

THE LITTLE BUCK has five men at work, and is a steady producer of good grade ore, which the owners always ship to the Billing smelter for treatment. A new strike on the east end of this mine bids fair to be quite a bonanza. Several tons of this ore have already been taken out that have netted the owners \$300 in silver and \$8 to \$10 in gold.

THE GRAY EAGLE has made another shipment to the Billing smelter. Like most of the Organ ore, it runs high in silver. There is an incline shaft of over 250 feet on this claim, with a good showing of ore in the breast.

THE SILVER STAR, which is an extension east of the Little Buck, has five men at work, and they are taking out sufficient mineral to pay all working expenses.

COPPER.—Two of our best copper properties have shut down on account of the fall in the price of copper.

OREGON.

PLACERS AND QUARTZ.—Jacksonville Times, June 26: A large number of claims have been located on the Yank ledge. Green Bros, of Galice creek, resumed work recently on their quartz ledge and have several men at work. They have one of the best ledges in the State. Excellent placer diggings on Cottonwood creek, above Shattuck's place, just south of the Siskiyou, are reported, and quite a number of men are at work there. John McCombe, of San Francisco, representing the capitalists who have bonded the Yank ledge, has returned home. He seems to be well pleased with the prospect. A great deal of prospecting is being done in Jackson and Josephine counties, and we may expect a great mining boom as soon as capital is introduced to develop our vast resources. Chas. W. Smith informs us that considerable placer mining is going on in the Hungry creek district, just across the Siskiyou mountains, and that some of the mines are paying well. Griffith & Runwalt are working a promising claim. Geo. H. Chick, of Yreka, Cal, and Mr. Ewing, said to be a California capitalist, went down to the Schumpf ledge in Willow Springs precinct yesterday. We learn that negotiations for the sale of this excellent property are likely to be commenced. We learn that a representative of a San Francisco company has lately bonded a placer mine on Wolf creek, Josephine county, and is now testing the same. He also intends to erect a quartz mill near that place, for the purpose of working some of the numerous quartz ledges in that vicinity. Capt. Ankeny is now superintending the work of building the Sterling Co.'s reservoir, and is making excellent progress. He is running a cut with a full ditch of water, and informs us that the late rains have in-

creased the supply so much that the mining season could have been extended several weeks. Capt. Haskell, who is said to represent Portland capital, has bonded the Roten ledge in Willow Springs precinct, and we learn will also bond the Swinden ledge near the same vicinity. Both of these mines have been worked before with fair results, and are likely to prove valuable property with the improved methods of crushing refractory ore. T. F. Dugan returned from Galice creek yesterday morning, having located several claims. He informs us that two tunnels are still being run on the Yank ledge, under the supervision of N. McNair, with favorable prospects. One tunnel has been run 120 feet and the other about 30 feet. Considerable prospecting besides this is also being done. D. Linn and John Orth, who have promised quartz ledges in this vicinity, propose subscribing liberally toward a quartz mill if the balance of our citizens will assist somewhat in the matter. There is no doubt but what the erection of even a one-stamp quartz mill would be of great benefit to this section, inasmuch as it would enable those owning quartz ledges to test their ore thoroughly and ascertain whether it is worth anything.

THE YANK LEDGE.—Cor. Oregon Sentinel, June 27: This monster ledge, which is the occasion of so much excitement now, is on Rogue river about 27 miles from Grant's Pass. The only means of transport at present is on the hurricane deck of a cayuse pony, as the last 12 miles is a rough mountain road. After traveling all day we reach the ledge. We can see for quite a distance where it ascends the mountain side, cropping out in higher pieces weighing a ton or more. The tunnel on this, the north side, has been run about 33 feet. The ore is very hard, and the entire work is done with powder. After inspecting the tunnel we follow Mr. McNair, the superintendent, up the mountain which the huge ledge traverses for a distance of 1,000 feet. About 300 feet above the river we find a second tunnel run by the Yank Gold and Silver Mining Co. of Jacksonville in 1877. This tunnel was driven about 42 feet, and the enterprise abandoned. The walls of this tunnel are covered with a blue and white powder secreted from the ore. A taste of this reveals arsenic and sulphate of copper.

UTAH.

BULLION.—Salt Lake Tribune, June 26. The shipment from this city for the week ending Saturday, June 20th, inclusive, was \$1,126,793. The receipts of bullion and ore in this city for the week ending June 24th, inclusive, were in aggregate \$92,578.95, of which \$80,228.95 was bullion, and \$12,350.00. For the week previous the receipts were \$32,458.52, of which \$22,058.52 was bullion and \$10,400.00. The output of the Ontario for the week was 86 bars of bullion, valued at \$52,344.99, bringing the total for the past year to date up to \$782,602.71. The Silver Reef district sent up silver to the value of \$4,433.96 during the week, of which the Stormont furnished 2 bars, \$2,780, and the Christy 1 bar, \$1,703.96. The product of the Hanauer smelter for the week was 9 cars of bullion of the value of \$23,400.

THE MILL.—Park Record, June 27: The good news has been circulated that the Marsac mill has been sold to the Ontario Co., and the transfer of the property will take place on the 1st of July. The Marsac Co. have been at considerable expense to repair and fit up this property which has been lying idle since the fall and winter of 1879-80. This prolonged idleness has been no fault of the management of the company. The only mill producing mines which have been worked to any extent whatever, since the repairs and additions have been made, has been the Ontario. The McHenry produced milling ore when it was worked, and several prospects showed indications of producing the same character of ore, but their developments had not progressed sufficiently to make them regular producers, and the mill enjoyed a long and protracted rest. For the past three or four years the Ontario extracted much more ore than their 40 stamps could handle, and for that period a new mill has been talked of, but no dirt for excavations has been removed.

THE STORMONT.—Southern Utah Times, June 26: The River Mill keeps ten pans running constantly. The Thompson is producing between 12 and 15 tons of ore per week and is looking well. The sixth level of the Savage is being extended south, and some fine ore bodies have been opened up. A winze has been run from the fifth to the sixth level, midway between the main shaft and the south end line, through a strong body of fair grade ore in which stopes are being opened up north and south. A winze is being sunk to the extreme south end of the mine from the fifth which will connect with the sixth level. This will open up a large chimney of ore, which lies partly on the Savage and partly on the Maggie ground. The stopes on this ore body have now reached a point above the fourth level.

THE CHRISTY.—The Christy Mill is running regularly, crushing between forty and forty-five tons of ore every 24 hours. The winze, below the 250-foot level in the New Shaft has now reached a depth of 70 feet. A drift is being run north on the ore, at a depth of 40 feet from the top of the winze. This winze has already opened up a large body of very high grade ore, with every indication that it will go down. The mine is furnishing between 12 and 15 tons of ore per day, although the work done at present is mainly for the purpose of prospecting and opening up the property. The stopes in the California are looking well and an average of 35 tons of ore is shipped to the mill every day. The drift on the fourth level south is now in a distance of 320 feet from the main incline. A cross-cut has been run from this level east to the ledge, at a point 280 feet from the working shaft—opening up a strong body of very fine ore, which is being stoped out. A prospecting winze is at present being sunk from the fifth level, 200 feet north of the main incline. It is now down to a depth of 40 feet, in ore all the way, showing conclusively that the ledge goes down.

OTHER NOTES.—Jas. McCarthy shipped 100 tons of ore to the Stormont mill, last week, which he extracted from Brischner's Maud mine. Andrew F. Greggeson made a 35 ton shipment of very good ore from the Duffin to the Stormont mill last week. There is a rumor current that parties interested in leaching matters here intend to put up a plant to reduce custom ores. A movement of this kind should receive the encouragement of every chlorider, individual mine owner, and every other person who desires to see our mining interests flourish.

Machinery Buyers, Attention!

Miners, Millmen, Steamboat men, and all others wishing Machinery, will find a rare opportunity for a bargain in the following lot offered for sale by H. D. BACON:

- 1 BOAT ENGINE Complete, size 12x11 inch.
- 1 UPRIGHT BOILER, 56x7x6 inch, with ash pan and doors complete.
- 1 CAMERON PUMP, 12 inch steam and 10 1/2 inch water cylinder.
- 2 WILCOX PUMPS, 3 1/2 inch steam and 2 1/2 inch water cylinder.
- 1 BAND WHEEL, 4 feet diameter and 12 inch face.
- 1 PLUNGER PUMP, 1 1/2 inches
- 1 DECK PUMP, 1 SMOKE STACK.
- 1 Lot of 1/2 inch, 3/4 inch, 1 inch, 1 1/2 inch, 2 inch and 3 inch Pipe and Fittings.

All of the above will be found in good order, and can be inspected, and further information may be obtained, at 222 Fremont Street, San Francisco.

Manufacture of Soaps.

Few people have much idea of how large a quantity of soap is used in the community from day to day. Every family uses more or less of it, as even the very poorest must have it. Soap is therefore not a luxury, but a necessity, though the manufacturers of late make it in such good form, and with such pleasant perfumes that it is a luxury to use the article. Even what we call common soap is made much better than formerly. People know now-a-days what good soap is, and are bound to have it. The demand has to be met by the manufacturers in making a higher grade than was formerly the case. A visit to the New England soap factory of Fischbeck & Gloatz, out on Utah street, in this city, recently, gave the writer a new idea of the soap question. The common idea of a soap factory is a place of grease and bad smells, but in this case at least, we found it very different. The factory is a commodious one, with perfect facilities and the appliances are such that the work is conducted in a very systematic manner.

These works were established here as long ago as 1852, and when first started only the common grades of soap were made, but now upwards of 50 different brands are manufactured.

At these works they have three immense kettles or boiling vats, holding 50,000 pounds each, in which the mixture is boiled. The latest improved mixing machines are in use and are run by a steam-engine. Some \$6,000 or \$7,000 have recently been spent in enlarging the factory, until it is now the most convenient in the city. They have all the improvements, elevator, steam pipes for heating and drying, commodious packing room, box room, label room, drying rooms, etc. The lye vats are over the tanks so that the lye may be drawn off as desired. The oils and the lye are refined very carefully, much of the success depending on that. The grade of the soap depends on the refining process, as the rough stock must be well prepared. Mr. Fischbeck has had many years' experience in refining stocks, and says that as he finds people want better soap than they used to he makes it to meet the market.

As stated, many brands of soap are made here. One very successful one is the "Queen Lily," which is used for general purposes, washing or toilet. Mr. Fischbeck has built up a big trade in this brand of soap alone. It washes without rubbing and is in good demand. All kinds of toilet soap in castles, different colors and scents, are made. These are neatly put up to suit special trade. They make the German powdered soaps, washing powders, etc., also the German green soap, mostly used for dye shops, silk houses, wool houses, etc. A number of dye houses are supplied with these fine soaps. Of course large quantities of common brown soap are made, but it is of superior quality. Borax soaps are also made; in fact, there are so many brands and styles that one would be surprised to learn the variety that can be made. The trade of these works extends all over this coast. This being a pioneer factory, it has long been well-known, and lately its facilities have been greatly enlarged to enable it to keep up with the demands.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco:

CENTRAL G. & S. M. Co., June 29.—Location, Pima Co., Arizona.—Capital Stock, \$10,000,000 in 100,000 shares. Directors—Timothy P. Riordan, Christian C. E. Russ, John Crockett, James Newlands and H. B. Tiffany.

EMMA G. & S. M. Co., June 29.—Location, Pima Co., Arizona.—Capital Stock, \$10,000,000 in 100,000 shares. Directors, T. P. Riordan, C. E. Russ, John Crockett, James Newlands and H. B. Tiffany.

COMBINATION RAILROAD CAR AXLE CO., June 30.—Object to sell the Combination Railroad Car Axle to purchase and manufacture rolling stock, acquire patent rights, etc.—Capital Stock, \$10,000,000.—Directors, Patrick Connolly, Philip McGovern, John Martin, J. C. Hamill, Arthur J. Hartford and Augustus Laver.

EXPLANATION.—Cl. for clear; Cy. cloudy; Fr. fair; Fy. foggy; — indicates too small to measure. Temperature wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

Mining Share Market.

The stock boards did not do their usual six days' work this week, the holidays shortening the time. It was just as well, however, as the volume of business has been small and prices far from satisfactory. Considerable ore has been sent to mills from Hale & Norcross, but none has passed under the stamps as yet; therefore, the real bullion yield and value of it of course is not definitely ascertained, but it is all good, free-milling ore, easily reduced, and should yield \$60 per ton or more. In fact, numerous daily assays indicate a much higher yield, average car samples being from \$80 to \$100 per ton during the past week. The *Enterprise* says: The fact of it is that the stock market is so sensitive that the least strike of water or porphyry met with scares all the small stockholders out of their great American wits, and the general desire to realize and be on the safe side, causes the most timid of stockholders to dump in their stocks, thus causing a general panic, as it were. Of course, as already stated, this may not prove to be a veritable bonanza, but there is every mineralogical and geological promise that it will. Stockholders, small or great, should be patient, same as Job used to be, and hold firm until the true merits of the situation can be fairly and squarely demonstrated. The Hale and Norcross management are doing their best to show a real paying mine, and to that end are utilizing what pay ore they have in sight, while sinking deeper and exploring elsewhere for more and better ore. All the other mines along the lode simply record usual progress, with no features of special interest.

Bullion Shipments.

Mt. Diablo, June 30, \$10,495; Richmond, Con., 24; \$23,659; Zelia, 22, \$1,344; Lexington, 22, \$1,984; Alice, 22, \$17,360; Moulton, 22, \$15,376; Hanauer, 23, \$2,400; Mayflower, 23, \$3,450; Ontario, 25, \$24,754; Hanauer, 25, \$5,200; Queen of the Hills, 25, \$1,300; Hanauer, 26, \$2,700; Queen of the Hills, 26, \$2,500; Crescent, 27, \$1,960; Hanauer, 27, \$2,700; Chrissy, 27, \$1,780; Honerine, 27, \$5,425; Hanauer, 28, \$4,100; 29, \$2,600. The banks of Salt Lake City report the receipt for the week ending June 24th, inclusive, of \$80,228.95 in bullion, and \$12,350 in ore; a total of \$92,758.95.

THE GEOLOGICAL SURVEY.—The coming fiscal year's work of the geological service has been mapped out and the plans have been approved by Secretary Lamar. Topographical parties will continue work already begun in Massachusetts and New Jersey, whither they have been invited by the State authorities, which co-operate with the Government to the extent of defraying one-half the expenses of the survey. The mapped areas of coal and iron bearing regions will be considerably enlarged. These are three in number, namely, the Appalachian district, extending from Maryland to Georgia and Alabama; portions of Missouri, Kansas and Arkansas, and a portion of Texas. Geographical surveys will also be continued in Arizona, New Mexico, California, Oregon, Montana and Idaho, and in the Yellowstone Park. Several astronomical parties will also be sent out to establish starting points for new surveys to be begun next year.

THERE is said to be great excitement in Union county, Eastern Oregon, over the discovery of rich placer mines. Some say the reports of the richness of the diggings are circulated and exaggerated by the Oregon Short Line railroad, which wants another Cœur d'Alene boom. The diggings are in the Eagle Creek mountains near the junction of the Powder and Snake rivers. The nearest point on the railway is at Durkee or Baker City, distant 30 miles. A wagon road runs within eight miles of the scene. The new camp is known as Pine Valley, and parties are pouring in at the rate of 50 a day. The diggings consist of placer and quartz.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—California.
A. C. KNOX—Ventura and Los Angeles Co's.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

HEINE PATENT SAFETY BOILER. RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept. 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

IRON CLAD MANUFACTURING CO.,
22 Cliff Street, New York.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

For Sale by DUNHAM, CARLIGAN & CO., San Francisco, Cal. | Manufactured only by JENKINS BROS., 71 John St. New York.

PAT. OCT. 25, 1881.

\$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. Thoro will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement patents owned by them.

Protected by patents May 4, 1883, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street.

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

THE
"TRIUMPH" ORE CONCENTRATOR.

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$3.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flouted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Cal.

1850. 1885.
RANKIN, BRAYTON & CO.,
...BUILDEES OF...
MINING MACHINERY.

San Francisco: Chicago: New York:
127 First Street. 100 N. Clinton. 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Continuous Coarse-Ore Quicksilver Furnaces.

Among other furnaces at the New Almaden Quicksilver Mines in this State is a pair of duplicate structures, with some improvements of detail on the continuous coarse-ore furnaces introduced at Idria, Austria, by Bergrath Exeli, from the model of the old Rumford lime-kiln. They are coarse-ore shaft-wasting furnaces, with exterior firing, and are represented in the accompanying engraving. The description we take from the elaborate and well-written paper prepared by S. B. Christy, of the University of California, for the American Institute of Mining Engineers.

As will be seen from the horizontal sections and top view, the lower half of the furnace is a regular hexagon, with abutments at the alternate sides. These abutments contain the fire, ash and draw-pits. Vertical section *AB* shows this still more clearly. Each abutment has on its face a fire-door and an ash-pit door, which latter also commands the discharge-door for the spent ore. The spent ore, after being drawn from the cooling pit of the shaft into the ash-pits, is left there until its lumes are exhausted, and is then drawn into the slag-cars through discharge-doors. These discharge-doors are placed on the side of each of the three abutments, lower down than the ash-pit doors. One of them is shown on the side of the abutment seen in the elevation.

The upper half of the furnace is cylindrical. It is closed at the top by a flat dome which contains the charging apparatus in the center. The fumes of the furnace are removed from the vapor-chamber at the top of the shaft above the surface of the ore, by means of iron pipes 12 inches in diameter. In No. 9, there are three of these discharge-pipes, one of which is placed at the top of the shaft on the side opposite each fire-place. In No. 7, there are, in addition, three others placed at the top of the shaft, one above each fire-place. By means of short cast-iron pipes, these bores are connected with a cast-iron down-take by means of a rectangular system of pipes which encircles the head of the furnace. These pipes, inclined downwards at an angle of 10°, lead into the condensers. To keep the pipes clear of soot, they contain small disks of iron. These disks are moved by iron rods, passing through stuffing-boxes at the angles of the pipe-system. They are only occasionally used, and the piston rods are luted with clay when not in use.

The shaft itself is a cylinder, 6 feet interior diameter, by 11 feet, 3 inches high, joined to the frustum of a cone 8 feet deep, contracting to a diameter of 4 feet at the bottom. Along the sides of the cylindrical part of the shaft, opposite each of the fire-places, are placed a series of 4 peep-holes. These, ordinarily closed gas-tight, are used to determine the height of the ore-column and its temperature.

The fire-places and discharges have the details common to well-designed continuous shaft roasting-furnaces of this type. The shaft and fire-places are lined with fire-brick; the rest of the furnace is of red brick, with the usual expansion-space between.

The entire structure rests on a slightly cone-shaped iron plate which crowns the foundation. This causes any quicksilver that might permeate the masonry to flow to the center of the furnace-bottom where provision is made for receiving it. Experience shows, however, that this pre-

caution is hardly necessary, as no metal has ever reached it.

The lower half of the furnace is inclosed by cast iron plates, bolted and cemented with rust-joints. The cylindrical part has a jacket of 4-inch sheet-iron; and a cast iron top-plate crowns the whole, and makes the furnace vapor-tight. The charging apparatus consists of a combi-

into the hopper, and the cover is lowered into place. The charge is then allowed to warm in the hopper, till it has nearly assumed the temperature of the top. This is done to avoid chilling the fumes and condensing them in the furnace by contact with cold ore. At the proper time, an equal volume of spent ore having been meanwhile drawn below into the ash-

follows: When first started for a campaign, they are filled above the level of the fire-places with spent ore, and then with ore to just below the level of the uppermost peep-hole. This level is never exceeded; so that there is always above the level of the ore a vapor-chamber, at least three feet high, containing 140 cubic feet, in which the fumes collect before passing out of the exit-flues. With the ore when charged there is mixed 1½ per cent of coal, charcoal, or coke, to assist in raising the temperature at the top of the furnace and to keep the ore-column more open. A good fire of pine or oak is maintained in each of the three fire-places. The charge of 1,600 pounds of ore and 24 pounds of coke or other fuel, previously weighed on the ore-scale, has been placed in the hopper. As soon as the lower peep-hole shows a dull cherry red, a quantity of spent ore is drawn into the ash-pits, the new charge is lowered into the furnace, and the hopper is refilled as before described.

The spent ore is allowed to remain in the ash-pits, discharging any fumes that may be still retained, back again through the fire-place into the furnace. At the end of this period it is drawn through the side doors of the abutments into the "slag" cars. Another charge, equal in volume to the new charge, is again drawn through the discharge bores of the shaft into the ash-pit, and then the new charge is dropped from the hopper into the furnace. This series of operations goes on every two hours as long as the campaign lasts.

At this rate these furnaces roast 9 3-5 tons per 24 hours, and, as by actual experiment they hold 21 tons, it takes 52 1-5 hours for a charge of ore to pass through the furnace. The capacity of these furnaces might easily be increased by drawing and charging more frequently or in greater quantities, and with poor ores this would be advisable; but with the rich ores (6 to 8 per cent) now treated in these furnaces, experience has led to the above practice.

The amount of labor required for these furnaces is very small. Two men per shift of 12 hours charge and discharge both of them.

In Mr. Christy's paper very elaborate tables are given, showing cost and results of work with these furnaces for a year. The total amount of ore treated, of quicksilver produced and the expenses, are given; also, the expense per day and per ton for each furnace and the average for both.

THE FIELD FOR PROSPECTORS.—For prospectors, says the *Scott Valley News*, we know of no better fields in the whole State of California than can be found in the belt of mining district lying between the Oregon State line on the north and Trinity county on the south, extending from Shasta on the east to Del Norte on the west. In this belt of country the placer mines, nearly all of them, have been rich, which goes to show that rich quartz is near at hand. Taking all things into consideration, we have no hesitancy in saying that here is the place which promises a prosperous outlook to the genuine and energetic prospector.

The Cour d'Alene mines seem to be making a very good showing, now that the wild stampede or crazy boom, or whatever it may be termed, is over, and the people have settled down to honest, practical mining.

OVER \$18,000 in gold dust was shipped from Auburn, Placer Co., in June.

IRON CLAD CONTINUOUS SHAFT FURNACE FOR QUICKSILVER ORE.

nation of devices used in iron-smelting, viz., the hanging cylinder, and cup, and cone. But, owing to the value and poisonous nature of quicksilver fumes, an additional cylinder and cover, with water or sand-joint, is introduced above the other devices (section *AB*). The rod moving the cone passes gas-tight through a stuffing-box in the center of the cover, and is attached to a balance-weight. The cover itself is also attached to balance-weights by two chains passing over pulleys. The charging is thus easily effected without exposing the men to the fumes. The cover is lifted; a charge of ore and a little fuel is dumped from the ore-car

pits, the cone is lowered and the charge dropped into the furnace. The small quantity of fumes that escapes into the space between the cup and cover is allowed to cool a few minutes, and the cover is again lifted and a new charge is added to the hopper.

These furnaces were erected under the immediate supervision of Mr. H. J. Huttner. The details of construction are throughout excellent; they work admirably, and, although they have been in almost continuous operation for nearly ten years, they have required hardly any repairs.

The mode of operating these furnaces is as

Treatment of Nickel-Cobalt Mattes.

Mr. James W. Neill, of Mine La Motte, Mo., read before the American Institute of Mining Engineers, some notes on the treatment of nickel-cobalt mattes at that mine, which are of general interest.

The occurrence of minerals of nickel and cobalt at Mine La Motte is probably known to every mineralogist. I will not attempt to describe these minerals, but before entering on my subject, will briefly mention the ores, etc., which call for metallurgical treatment and enter into the composition of our mattes. Our staple lead-ore, the dressed galena, is the chief source of nickel and cobalt. It carries but a small percentage of these metals, viz., 0.2 to 0.3 per cent usually, though when much copper pyrites is contained in the gangue, the amount of nickel and cobalt may be as great as 1.0 to 1.5 per cent. Next in importance is the "middle product" of the dressing works, consisting of the sulphides of iron (and copper) with gangue and galena. This usually carries 20 to 23 per cent of lead, 0.5 to 1.0 per cent of copper and 2.5 to 3.5 per cent of nickel and cobalt. A larger percentage of copper always carries with it an increase of nickel and cobalt. In some few cases 12 to 15 per cent of copper gives 6.5 to 8.0 per cent of these metals. Besides these products of the dressing-works, there is a small quantity of true nickel-cobalt ore produced, which, averaging only 1.0 to 2.5 per cent, has until lately been of small importance. Through recent developments in the deeper workings, where the nickel, cobalt and copper sulphides occur disseminated (but separate from one another) in a porous sandstone, the amount of this ore has been largely increased.

The dressed galena we roast in reverberatory furnaces, treating from 6 to 8 tons per 24 hours, and leaving from 5 to 7 per cent of sulphur in the charge. This is then treated in the shaft-furnace with fluxes, producing lead, "first matte" and slag. The "middle product" is also roasted in the same furnaces (leaving from 8 to 10 per cent of sulphur), and is then used in part as iron-flux in the lead-smelting, where it can only be employed in small quantities, lest it should raise too much the percentage of sulphur in the charge, and also give mechanical trouble from its fineness. Where these sulphides are rich in copper and nickel-cobalt, they are roasted and smelted separately, producing a rich matte.

The first matte formed, as above remarked, from lead-ore with sulphides as flux, etc., carries usually from 3 to 3.5 per cent of nickel and cobalt (about 2 nickel or 1 cobalt), 0.5 to 1 per cent of copper, and 20 to 25 per cent of lead. After a period of exposure to the weather, which slacks it more or less thoroughly, it is broken with hammers to fist-size and roasted in a reverberatory having a 45-foot by 12-foot hearth. This furnace produces from $\frac{1}{2}$ to 6 tons of roasted material in 24 hours, leaving about 5 per cent of sulphur in the charge. It burns from 4 to 6 cords of wood, and is served by 6 to 8 men, according to the amount produced, etc.

This roasted first matte, when accumulated sufficiently, is used as iron flux in smelting the lead-ore, producing lead, "second matte" and slag. The second matte should carry, if no losses occurred, at least double the quantity of nickel and cobalt contained in the first; but experience has proved that the more thorough the roasting of the first matte, the greater the loss of nickel and cobalt in the slag; i. e., the better the matte is as an iron-flux, the worse the concentration. I have found from 5 to 6 per cent of sulphur in the first matte to be the best limit. This does not make a very good flux, but the losses are smaller.

Slags from This Matte-Lead Smelting
Having shown as much as 0.7 per cent of nickel and cobalt, I made one campaign, as an experiment, on this roasted first matte alone, using acid fluxes, and expecting to produce a matte rich enough to warrant shipment. But the resulting matte, carrying 12 to 15 per cent of nickel and cobalt and 25 to 30 per cent of lead, was made at such expense for labor and fuel, that we returned to the old method.

The second matte, carrying from 3.5 to 6.5 (usually 5 to 6) per cent of nickel and cobalt, 25 to 30 per cent of lead and 1.0 to 2.0 per cent of copper, are roasted in the same manner as the first mattes, but not so sharply, the roasted charge retaining from 7 to 9 per cent of sulphur. This high percentage is necessary to protect the nickel and cobalt, which, if entirely deprived of sulphur, will largely enter the slag, even though the sulphur-contents of the charge be sufficient to "cover" them. Of course, in the subsequent smelting, the matte produced is high in lead. It will thus be seen that in this process the lead works against the concentration of the nickel and cobalt.

Until recently, the roasted second matte was smelted with acid fluxes (such as sandstone, old acid slags, etc.) and limestone. The resulting "third matte," after crushing and packing in barrels, was shipped to Europe. This smelting was done in the lead-ore furnace, which is circular, 45 inches in diameter at tuyeres, 6 feet at charge-door and 12 feet high. It proved too large for the purpose. The charge being very low in lead, and of the lead present, very little being reduced, the lead always froze in the basin and "well," thus increasing the percentage of lead in the matte by imper-

fect mechanical separation in the slag-pots. Four per cent of lead was the highest we produced from the second matte by this process. The resulting third matte usually carried from 35 to 40 per cent of lead, 12 to 15 to 17 per cent of nickel and cobalt, and 3 to 5 per cent of copper. The slags would average 2.25, and often 1.75 per cent of nickel and cobalt, and 2 to 2.5 per cent of lead. The losses in the slags were large; and, moreover, by shipping this matte, the lead contents (35 to 40 per cent) were lost, since the buyers do not pay for lead.

An Attempt to Concentrate

This matte further by melting it in a reverberatory furnace, was made some years ago, but was not a success, the resulting (granulated) matte being higher in lead than in direct proportion to the amount of iron which had been slagged off, while the slag carried 5 per cent of nickel and cobalt, and 5 per cent of lead. I am told that formerly some lead was regained from the matte, by an addition of metallic iron to the molten matte in this furnace; but I found this to be impracticable, the expense of iron, labor and fuel being far above the value of any lead regained.

In this state of affairs I advised the trial of arsenic as a means of separating nickel and cobalt from the lead by making speiss; and after much discussion of arsenic ores, speiss, etc., we bought 13 tons of mispickel-ore (carrying 23 per cent of arsenic) from the Canada Consolidated Gold Mine of Marmora, Ont. With this we smelted in the large furnace some 35 tons of a roasted matte, carrying 12.5 per cent of nickel and cobalt; the furnace basin, as usual, chilled; and the resulting speiss and matte did not separate perfectly in the pots. The clean speiss regained, carried 36 per cent of nickel and cobalt and only six per cent of lead. The matte was still high in lead (35 per cent); but it carried 19 per cent of nickel and cobalt. The slag was unsatisfactory, carrying many shots of matte, and was all returned to the furnace. No analysis was made of it. The lead produced carried some 3 oz. gold and 3 oz. silver per ton. There was a large loss of arsenic in the fumes, probably carried off by the sulphur, as the gases at times looked yellowish, at times red.

This experiment, though financially not successful, proved satisfactorily that arsenic would separate the nickel and cobalt from the lead, and would prevent large losses in the slags. It showed, also, that the lead-furnace was too large. Before making further experiments, we built a smaller and more suitable furnace, 30 inches square at the tuyere-line, 48 inches at the charge-door, and 6 feet, 6 inches between these points, with 18 inches depth of basin, lead-well behind, fore-hearth (or sump), three tuyeres, no jackets, sides of 9-inch fire-brick, cooled by irrigation.

For our next experiment, we bought some Low-Grade Speiss.

A hand-sample of which had the following composition: silver 3, ounces per ton; gold, 0.04 per ton; lead, 5 per cent; copper, 3 per cent; arsenic, 12.5 per cent. (antimony not determined); iron, 55 per cent. With this speiss, I smelted a second matte, carrying in percentage 23 of lead, 1 of copper, 6 of sulphur, 5.28 of nickel and cobalt and 35 of iron. As an acid flux, some of the nickel-cobalt ore previously mentioned, was employed. This carried 77 silica, 2 nickel and cobalt, 2 copper and lime, per cent. After the first few shifts, the fumes of arsenic, which at first were strong, almost disappeared; the lead (or rather bullion) ran freely and remained hot throughout; the slag was much higher in silica than calculated (owing probably in part to corrosive action on the fire-brick walls), but was fair in appearance and separated nicely from matte and speiss; and these also separated well in the pots. The slag carried one per cent of lead (wet assay) and 0.78 per cent of nickel and cobalt. The amount of speiss made was much larger than calculated (owing to the larger percentage of antimony in the purchased speiss), and, of course, the percentage of nickel and cobalt was lower than expected, viz., 14.5 per cent, while the lead amounted to 12 and the copper to 5.8 per cent. The matte produced carried only 5.14 per cent of nickel and cobalt, 5 per cent of copper and 13 of lead, was thus too poor to ship (as was desired) and will be treated with the next lot. The lead produced amounted to 26 per cent of the matte used, showing that the speiss sample did not justly represent the pile. This lead carried per ton, 9 ounces silver and 0.1 ounce gold, and netted us enough to pay all expenses of smelting and leave a decent margin. After running ten days, the brick walls of the furnace were nearly eaten through, in spite of the water; and, as other work was pressing, I blew down; but we have now ordered a set of water jackets, and expect to blow in again on their arrival.

This last experiment has conclusively proved that the old method must be abandoned, certainly, for the treatment of the second matte; whether it will not be more economical to treat the first matte also with speiss, remains for future experiment to determine. The same may be said of the "middle-product" sulphides.

Whether the nickel-cobalt speiss produced can be advantageously treated here, either by using it again as arsenic-surrogate in the blast-furnace with further first or second matte, or by concentrating in the reverberatory-furnace, is also a question for future solution.

The Russian Government has increased the tariff on imports from 10 to 12 per cent.

The Evil Genii of Mining Camps.

The evil spirits of mining camps are the locator, the bonder and the crank. Now, we propose to give the natural history of these odd geniuses separately, because, though they all work evil, they have different ways of working.

The locator is the man who locates every vein, seam and quartz boulder he finds, and holds the same to the detriment of the honest prospector, who is met at every turn by locations, which are usually simply a notice without any monuments on the claim, and very seldom does the locator take the trouble to have his location recorded, and he never is guilty of any such folly as to work his location, and holds it like a dog in the manger, by location and relocation from year to year, always asking enough for his claim to buy a good mine. Now, we think the man who takes possession of a few quartz holders or the croppings of a vein, and does no work, has earned nothing and deserves nothing; but the honest miner, who works a mine and develops it, is a benefit to the district and the State. We are tired of these locators, who are holding the mines of the county without working them, and whose only object is to sell them to some tender-foot, just as the boys trade jack-knives, "unsight, unseen."

The next evil genius is the bonder, who is, in mining matters, the middleman. He is generally an adventurer, of good address, who knows a little of the technical terms of the craft, and has that mysterious something—a "company"—to back him. He is well versed in the slang terms of the mines, and can talk learnedly of stopping, sinking, raising, concentration, amalgamating, etc., and generally this is as far as his knowledge goes. He mines well—in a bar-room; but if he attempts it practically, he makes a failure, always. He is the villain of the play. The locator gets his claim, and the bonder catches the company, and generally makes the lion's share of the money. The bonder generally makes his game by showing a lot of rich specimens, or by the "traditions" of the camp about rich ore in the mine. He tells how Mexicans, or the early prospectors took out rich ore, etc., and draws largely on his imagination for his facts.

The last is the crank, who is of "imagination all compact," and sees more millions in a barren quartz vein than the Bank of England can hold. A color of gold looks as large to him as the full moon, and in his calculations he has not the slightest regard for the decimal point, for \$5,000 becomes, in his mind, \$50,000. A small bunch of quartz is, to him, a big bonanza, and he sees, with all the second sight imagination, untold wealth in the bowels of the earth, and generally dies the victim of his own fancies; for these cranks will starve to death rather than sell these treasures of their imagination.

These three evil spirits are, truly speaking, parasites and non-producers. They are clogs on the wheels of mining progress, and want to be, metaphorically speaking, sat down upon by all honest miners.—*Tuolumne Independent.*

Freight on Salt.

It is sincerely to be hoped that the Union Pacific management will take into careful consideration the facts and figures which have been presented to them by the mill men of this district, touching the present rate on salt. That the rate of \$20 per ton from Ogden is too high, there can be no question. Silver mining in Butte to-day is not what it was three or four years ago. The mines are much deeper, the volume of water has increased, the ore has grown base, and in short, the cost of extraction and reduction has been very largely increased. It is true there is an abundance of silver ore in the camp, but it is mainly of a very low grade. The choicest free milling bodies have all been worked out, as far as discovered. The silver ore being mined here to-day will not average more than thirty-five ounces to the ton. If it falls much below this, it cannot be profitably reduced. When the ore is base, it requires from 12 to 15 per cent. of salt to treat it successfully. The amount of salt consumed in the treatment of silver ore is about thirty tons per day.

There are at present three or four mills lying idle in this camp, not from any lack of ore, but because their ore supply is of too low a grade to be profitably worked with the present rate on salt.

This tariff on salt has grown to be the leading question with our silver men. The appeal for relief is born of the necessities of the case, and the alternative becomes every day more apparent, that a cheaper rate must be had, or the music of the silver mill stamps will cease to be heard.

The Union Pacific management have heretofore paid careful heed to the concessions asked by the copper producers of this district. Their action in reducing the rate on copper matte and ores was a much needed measure and entitles them to the thanks of this community. Now, we ask them to look closely into the statements which have been and will hereafter be made to them respecting this salt question, believing that they will find therein ample argument for an immediate and material reduction of the rate on salt.—*Butte Inter-Mountain.*

The Lick Observatory.

Capt. Thomas Frazer, Superintendent of the Lick Observatory, in an interview states that they are getting along very smoothly at the observatory, and if nothing occurs to impede progress, they hope within two years to complete the construction and enable the Trustees to transfer to the State University this most valuable bequest.

Capt. Frazer says: "I expect to hear every day that the process of rough grinding has been completed successfully. This is the twentieth attempt, all others having failed. In the process of making, the constituents of glass are first carefully selected and the whole melted into a rough hock; then melted or ground down to the general shape required. This is the work of the glass-maker, Field, which, I trust, has almost been successfully completed now. He must see that there are no imperfections whatsoever. The glass is then transferred to Alvan Clark, the optician, who polishes and prepares it for insertion in the telescope. All the principal danger lies in the first process, and if this is successfully completed all is practically over. So, if we learn in a few days that Alvan Clark has accepted the glass, there need be but little apprehension of future delays. So far the Trustees have expended about \$290,000, of which \$12,500 has been paid to Alvan Clark upon his contract of \$51,000 for the object glass, and the remainder upon the building and various instruments. The original bequest, as you know, was \$700,000, and we expect to expend \$160,000 or 200,000 more upon the construction, leaving a nest egg for the University of two hundred or two hundred and fifty thousand. The Trustees simply construct, while it is left for the University to appoint a corps of astronomers to conduct the investigations.

"As for astronomical investigation, there is practically no work being done now, although we have already some of the best and most improved instruments in the world, including a 12 inch equatorial telescope, a 6 inch French meridian circle, a 4-inch French transit, a 4-inch comet seeker, a 6½-inch equatorial telescope, an eclipse telescope, a measuring engine, a set of self-recording barometers, rain-gauge and wind-gauge, and other minor instruments ad libitum. For the past six years we have kept statistics upon the barometer, wind and rain-gauges, which, of course, will be valuable.

"As to the completed observatory there can be no doubt that it will far exceed the best in the world. That has already been admitted by the best astronomers, such as Newcomb, Harkness, Hall, Young, Todd, Burnham and others. At the observation of the transit of Venus, Prof. Newcomb stated that the best reports were received from our observatory. In the first place, Mt. Hamilton is most phenomenally adapted by the climate, the rarity of its atmosphere, its freedom from disturbance, and possesses every good factor, in fact, as a point of astronomical observation. Combined with this is the fact that we are procuring instruments regardless of expense, and you can realize how far ahead of all other observations it will be. The object glass of our large telescope will be 36 inches in diameter, exceeding by 6 inches the largest in the world.

"I've seen some misstatements in regard to that glass. But it is only a 28-inch glass. Alvan Clark has just completed a 30-inch glass for the Russian Government, but it was omitted to stipulate in the contract for a guarantee of perfection, and as a result the glass contains a large defect which will virtually reduce the size of the object glass considerably. In the case of our glass, however, perfection is guaranteed or no pay.

"I've just recently returned from a three months' tour through 12 of the best observatories of the United States, visiting among others those at Washington, University of Virginia, Madison, Amherst, Harvard, Yale, Columbia and Princeton, and I do not hesitate to state that all combined could be placed under the roof of the Lick Observatory. The largest object glass possessed by any is 26 inches. Our site is immeasurably superior to any other in the world. We will be enabled to view objects 20 degrees further south than any observatory in the northern hemisphere.

"Aside from the astronomical observations which must benefit the whole world, it is the intention to give full and complete weather prognostications. Even with our present limited capacity, I am enabled to prophesy a storm five or six days in advance, and I have no doubt but that when all is completed, the general outline of the weather for an entire season may be told beforehand. You see, California needs a good local observatory. When the Lick Observatory is completed daily bulletins will be issued which can be relied upon."

QUARTZ MOUNTAIN.—The item going the rounds of the press concerning extravagance at the Quartz Mountain, Fresno county, is greatly exaggerated. The president's house is said to have cost \$30,000 and to be elegantly furnished. We are told it really cost about \$3,500. So far from a "flashy superintendent, fast horses and champagne," one who is in a position to know says the superintendent does not touch wine or liquor. The item, which is being extensively copied, is stated as being a great misrepresentation of facts.

MECHANICAL PROGRESS.

The Compression of Molten Steel.

In his recent inaugural address as president of the Iron and Steel Institute, Dr. Percy said: Various methods have been tried for the compression of steel, of which I will mention two. A kind of gunpowder was proposed for this purpose in the United States in 1869. It was recommended for the casting of steel cannon, with the special object of preventing blow holes. The metal was run into a suitable mold, the mouth of which was immediately afterward hermetically closed by a metallic cap, firmly fixed in its place by bolts or otherwise. In the center of the cap was fitted a vertical pipe, provided with a stop enck at its lower end, while its upper end was closed by a washer pressed by a bolt so as to act as a safety valve. Before attaching the cap at, say, an inch from the surface of the molten metal, a charge of about a quarter of an ounce of powder, composed of 80 per cent of niter and 20 of charcoal, was put into the vertical pipe between the stop enck and the washer. On opening the stop enck, the powder falls out the metal, ignites, and, it is said, produces about one-third of a cubic foot of gas at the temperature of 3,000° Fahr., which exerts a pressure equivalent to that of a head of liquid metal 90 feet high, supposing the capacity between the cap and the surface of the metal to amount to 30 cubic inches. Whether this process was ever tried, and if so with what result, I am unable to say.

Liquid carbonic acid has been used for compressing steel at Krupp's works, at Essen, and, it is reported, with success. The top of the mold, when closed is connected by a pipe with a vessel containing liquid carbonic acid, heated sufficiently to produce the necessary degree of vapor tension, which, at 400° Fahr., is said to amount to 800 atmospheres, or only slightly to exceed five tons to the square inch. I have heard it rumored that the process has been abandoned, but whether truly or not I cannot say.

In 1876 Sir Joseph Whitworth had the kindness to permit me to see his process in operation, and was present at the time. The charge of molten steel was from seven to eight tons, and the pressure about seven tons to the square inch.

Balancing Machinery.

We frequently observe in workshops, factories and mills, where machinery is in operation, says a contributor to an English journal, that the floors, the walls and even the ground in the neighborhood are in a constant state of vibration, causing an unpleasant sensation and a reasonable fear of danger. Now, the principal causes of such results arise from the inaccurate balancing of the drums, pulleys and gearing, as the following fact will illustrate: Belonging to one of the largest machine works in England there was a large shed in which was a circular saw, driven from a countershaft fixed to the roof beam; this shaft was driven about 600 revolutions per minute, and the pulley was 30 inches in diameter; it caused the beam and roof to vibrate exceedingly, to prevent which the proprietors secured a large upright and spur timber to the beam and to the stonework on the ground; when the shaft was put in motion the vibration was as great as ever, and shook the ground all about it so that draughtsmen and clerks in a building on the other side of the street complained of its interference with their operations. The foreman of the works mentioned this fact to me and I informed him that the pulley was not balanced; "but," said the foreman, "it is beautifully turned and polished, and runs as true as a hair." "It matters not," said I, "it is not balanced." I then showed him how to test it, and found that the pulley was 2½ pounds out of balance; it was then adjusted and perfectly poised and again set in motion. The result was most satisfactory; it worked without any perceptible vibration, and as was remarked, as quietly as a lever watch. It thus appears that the small weight of 2½ pounds uncounterpoised, and revolving at a velocity of 600 or 700 per minute, is sufficient to exert the marvelous force described; and when we consider that there may be hundreds of wheels, pulleys, etc., similarly poised in mills or workshops, we can account for much of the vibration.

STEEL MADE AND REWORKED.—Some tests have been made of steel from the roll and from the hammer as compared with steel that is annealed and turned to size. It appears from these tests that the commercial steel, untouched by annealing heat or by the turning tool, is better in its resistant qualities than the annealed and turned material. Unannealed steel is tougher—it resists torsion better—than annealed steel. This fact was constant through a large number of tests of the steel made by five of the most prominent and best known manufacturers. Further trials proved the fact that steel as it comes from the hammer is better for certain tools than the same steel annealed, turned and after worked. A square bar of commercial steel centered and cut to thread made a better tap than the same bar annealed and turned round, and then four-scored and retempered. It is possible that for certain tools—lengthwise tools, as taps and reamers—steel might be forged in bars to size and shape with

advantage, not alone as to saving of lathe work, but as to value of the finished tool. If steel-makers can be induced by sufficient orders, it is probable the experiment will be made on a scale large enough to establish the question of its value. The claim of those who have made the tests is that the "skin" of the steel as it comes from under the hammer is stronger than any after coating by the oxidizing of tempering.

Hints on the Care of Tools.

The following hints on the best means of keeping tools in good condition cannot fail to be useful:

WOODEN PARTS.—The wooden parts of tools, such as the stocks of planes and handles of chisels, are often made to have a nice appearance by French polishing; but this adds nothing to their durability. A much better plan is to let them soak in linseed oil for a week, and rub them with a cloth for a few minutes every day for a week or two. This produces a beautiful surface, and at the same time exerts a solidifying and preservative action on the wood.

IRON PARTS.—Rust preventives.—The following receipts are recommended for preventing rust on iron and steel surfaces:

(1.) Caoutchouc oil is said to have proved efficient in preventing rust, and to have been adopted by the German army. It only requires to be spread with a piece of flannel in a very thin layer over the metallic surface, and allowed to dry up. Such a coating will afford security against all atmospheric influences, and will not show any cracks under the microscope after a year's standing. To remove it the article has simply to be treated with caoutchouc oil again, and washed after 12 to 24 hours.

(2.) A solution of India rubber in benzine has been used for years as a coating for steel, iron, and lead, and has been found a simple means of keeping them from oxidizing. It can be easily applied with a brush, and is as easily rubbed off. It should be made about the consistency of cream.

(3.) All steel articles can be perfectly preserved from rust by putting a lump of freshly-burnt lime in the drawer or case in which they are kept. If things are to be moved (as a gun in its case, for instance), put the lime in a muslin bag. This is especially valuable for specimens of iron when fractured, for in a moderately dry place the lime will not want any renewing for many years, as it is capable of absorbing a large quantity of moisture. Articles in use should be placed in a box nearly filled with thoroughly pulverized slaked lime. Before using them rub well with a woolen cloth.

(4.) Soft soap, with half its weight of pearls; one ounce of mixture in about one gallon boiling water. This is in every-day use in most engineers' shops in the drip-cans used for turning long articles bright in wrought iron and steel. The work, though constantly moist, does not rust, and bright nuts are immersed in it for days till wanted, and retain their polish.

NATURAL GAS VS. COAL.—A heavy reduction was recently made at the Alleghany Water Works, in Pittsburgh, by the change of fuel from coal to natural gas. There are four batteries of boilers at the works, two of four boilers and two of three boilers. Only two batteries are used, the others being the reserve. A short time since arrangements were made for using natural gas under one of the largest batteries, and a test made proved successful. The other battery will still be heated by the old method. The estimated saving on coal is about 30 per cent. Natural gas costs \$12 per day, while to operate the battery with coal the expense has been \$18 per day. In addition to this the wages of two firemen, \$120 per month, is saved. There is also a trifling saving on utensils, such as shovels, pokers, grate-bars, etc. If the natural gas gives out fire can be placed in the reserve boilers in a short time.

GAS AGAINST STEAM.—Civil Engineer L. Starck, at Mayence, Germany has endeavored to solve the problem of cheap gas for large gas motors (horse-power), by a method of simultaneously producing hydrogen gas, coal gas and oil gas in one furnace. The cost is said to be so cheap as to be able to run a large gas motor at less cost than the best constructed steam-engine. L. Starck uses the cheapest coal, and his method produces by-products which will realize higher prices than the cost of production, thus getting the gas free. His method is based on the use of moss turf, which has a great capacity for absorption—for instance, one part turf will absorb 5 to 6 parts liquid oil, petroleum refuses, &c. This capacity of turf would also simplify the refining of crude oil and facilitate the bleaching of heavy oil.

AN ABSOLUTELY EXACT STRAIGHT EDGE of more than thirty-six inches is a wonder of mechanism. One of six feet was not recently believed possible, although several had been made on different plans of web-like and truss construction. It has been claimed, however, that almost absolute exactness has been secured by a straight edge twelve feet long. The appliance looks like an arched truss, the highest spring of the arch being only twenty inches in a length of twelve feet.

TO PREVENT RUST.—To prevent the rusting of steel instruments smear their surface with a mixture of equal parts of carbolic acid and olive oil.

SCIENTIFIC PROGRESS.

THE QUATERNARY FAUNA OF INDIANA.—As every student of geology knows, the Quaternary period was characterized by great changes of climate, accompanied by remarkable sinking and rising of the earth's crust. Enormous quantities of clay, gravel, and boulders were carried by glacial action from the higher latitudes as far south as the Ohio river, and even, at some points, a few miles into Kentucky. The area thus covered by drift extends from Cape Cod as far west as Dakota, and, farther north, to the Rocky mountains and the Pacific Coast. The limits of glacial action are marked by ridges known as moraines, in which have been found some interesting relics of ancient life. Following this glacial era came one of general depression, when the Atlantic Ocean extended inland so far that whales and seals played in the waters now known as Lake Champlain; while the chain of lakes along our northern border were connected with the Gulf of Mexico. A subsequent upward movement of the earth's crust restored this depressed region to its former level, when the continent took its present shape, and what is geologically known as the Recent period began, which is still in continuance. The Quaternary period was remarkable for its gigantic mammalian fauna, and numerous animals then existed in North America that have now no living representatives. The places where such remains are most liable to be found are in the numerous caverns of southern Indiana, the wide marshes and swamps of the northern portions of the State, the moraines and other deposits left by the glacial action of the earlier part of the period, and the beaches and terraces characterizing the latter portion.—H. C. Horey.

POTENTIAL ANIMAL LIFE IN FLESH.—In a paper on "The liquefaction of gases and other effects of extreme cold," lately read before the Philosophical Society of Glasgow, J. J. Coleman stated that at about 86° C. the flesh of animals, such as nutmeg, becomes so exceedingly hard that it rings like porcelain when struck with an iron instrument—indeed, crushes by the blow of a hammer into a fine powder, in which muscle, fat and bone are intermingled; and, what is still more singular, according to the experiments of Mr. Coleman and Prof. McKendrick, recently communicated to this society, it appears that microbia alive in the flesh before the freezing operations can be detected still alive after thawing, even after exposure to 86° C. or 133° F. for 100 hours, thus pointing to potential animal life in the solid state capable of being brought into activity by heat and moisture. In the discussion which followed Sir W. Thomson said it would be most interesting to see if Mr. Coleman's deduction—that "potential life can exist in a solid state"—is confirmed by experiments on vegetable seeds, with a view to ascertaining whether their vitality is destroyed by desiccation in a Sprengel vacuum or by long-continued drying at moderate temperatures.

WOOD CRYSTALS.—Chemical analysis has long since detected the presence of various mineral substances—potash, soda, silica, etc.—in many forms of vegetable growth; and the main source of potash at present, as of soda in former times, is the ashes of certain trees and plants. It also appears, as the result of microscopic investigation, that many of these mineral salts retain or assume a crystalline form even when embedded in the solid portion or bark of certain plants, as the microscope most unmistakably reveals. Should it be proved that the form these crystals assume is regulated or modified by the conditions and character of the growth which encloses them, it is evident that the fact would be one of great interest to science, and of peculiar value and service to the druggist, since it would enable him to determine the nature and purity of any medicinal bark or wood, by examining a crushed sample under the glass, and comparing the forms of the crystals with those presented in a series of standard plates. Thus the absence of the desired crystal, or the presence of others differing in form from the standard, would enable him to determine the nature and extent of the impurity or adulteration. A new study is here opened up.

PROGRESS IN ASTRONOMY.—When the old astronomers mistook the earth for the center of the solar system, or that of the universe, what were the results of their calculations? When the sun and earth were put in their right places by Copernicus, how astronomy progressed in the right direction; and what splendid advances were made by Sir Isaac Newton and Sir William Herschel! The elements of our solar system were not only determined, but with the telescope they peered into the invisible heavens, unfolding telescopic stars, and nebulae composing and decomposing in the formation of stars. With the spectroscope they have not only given the elementary composition of our sun, but that of the stars and nebulae, with their speed of motion in approaching and receding from our system in their orbicular motions. Such have been the achievements in the stride of science in the microcosm of the universe. What exultation there is in the conception of all this!

ZYLONITE.—The basis of the very remarkable substance zylonite is a plain white tissue paper, made from cotton or cotton and linen rags,

The paper being first treated with a bath of sulphuric and other gases, undergoes a chemical change. The acid is then carefully washed out and the paper treated with another preparation of alcohol and camphor. After this it assumes an appearance very much like parchment. It is then capable of being worked up into plates of any thickness, rendered almost perfectly transparent or given any of the brilliant colors that silk will take. It is much more flexible than either horn or ivory, and much less brittle.

PETROLEUM AS A WOOD PRESERVER.—A correspondent of the *Rural New Yorker* writes in regard to the value of crude petroleum as a wood preserver, as follows: Fresh, light petroleum, if applied warm, will penetrate—if the wood is dry—almost as readily as water, and once thoroughly saturated "it is there to stay"; water will not wash it out. I have been for years a producer of crude petroleum, and have yet to find a board or piece of timber connected, or otherwise, with the works, that had once been saturated, which is not sound where the oil touched, while frequently parts not oiled have decayed rapidly. I have just finished taking down and making over into smaller ones, a wooden storage tank. This was first built over 18 years ago, and left exposed to all kinds of weather. We did not find one rotten spot in it; everything was sound. I have known oil barrels, and also small tanks, to be covered with a thin layer of earth and remain so, in one case over 14 years, and come out sound. He especially states that saturated with this moisture-repellant from nature's own marvelous laboratory, sills of barns and similar buildings will outlast any other part of the frame; and he remarks that, after the first two or three days, the application does not expose wood to any increased risk from fire.

SALTS IN WATER.—A small amount of any soluble salt dissolved in water will heighten the boiling point. For instance, about four per cent of common salt dissolved in pure water will raise its boiling point 213 deg. F., while a saturated solution of calcium chloride (i. e., Ca Cl₂, not chloride of lime) boils at 355 deg. F. It is for this reason that when sea-water, or any other water charged with saline matter is used for steam engine boilers it becomes gradually stronger of the salt contained in it (for the salt is fixed and does not evaporate), and has at stated periods to be blown off, otherwise, as the boiling point rises, there would be a great waste of fuel and deposition of scale upon the surface of the boiler.

CHEMISTRY OF THE ANCIENTS.—Chemistry, which, like other sciences, has been wonderfully developed during the past century, is often mentioned as of recent origin, but many chemical facts were known to the ancients even before the dawn of historical times. Specimens of their work still in existence indicate that the ancient Egyptians had considerable chemical knowledge. They were skilled in smelting ores and working metals, had a good understanding of dyes, made glass and knew how to prevent decomposition of dead animal matter, while the priesthood evidently had some idea of pharmaceutical chemistry.

ASSOCIATION OF COMETS.—"There is a family of comets," says Mr. R. A. Proctor, "every member of which travels in an orbit passing near the orbit of Jupiter; another family every member of which can be similarly associated with Saturn; others depending in the same way on Uranus, others on Neptune; and, in fact, so fully has this sort of relation been recognized that the idea has ever been thrown out that a planet traveling outside the orbit of Neptune, but as yet unknown, might be detected by the movements of a comet intersecting the great plane of planetary movement far beyond Neptune's orbit."

THE USE OF FORMENE AS A COOLING AGENT.—Wroblewski having claimed priority for the employment of formene, in producing very low temperatures, stated that his experiments date from the month of March, 1884, while Cailletet did not speak of his own experiments until April. Cailletet replies by a sealed note, which was deposited on December 12, 1881, in which he proposes to apply formene and ethylene in studying the compressibility of nitrogen, hydrogen, etc., at very low temperatures.—*Comptes Rendus*.

BATTERY WITH TWO LIQUIDS.—The author succeeds in suppressing the nitrous vapors of the Bunsen battery by using a depolarizing liquid, consisting of nitric acid in which 75 grs. potassium dichromate have been dissolved per liter. In contact with the zinc he employs either acidulated water or potassium disulphate.—A. Dupre.

HIGH PRESSURE STEAM.—A peculiarity of high pressure steam is, that it does not scald the hand applied near the orifice from which it is issuing. This arises from the fact that on its first escape it expands so rapidly that its heat becomes latent. In other words, the heat is so reduced by expansion that it is cold to the hand.

OXYGENATED WATER.—Distilled water, saturated with oxygen, is now prepared in Paris, and is rapidly gaining favor. Aside from its healthfulness for ordinary table use, it is said to be valuable in the treatment of diseases of the digestive organs.

Passing Events.

It is stated that in many of the small camps along the line of the Carson and Colorado, where miners are working for themselves in a small way, matters are looking very well, and considerable ore is being taken out. Further south, however, in Mono county in this State, all the camps are dull and little is doing.

The prices of lead and copper still continue low, and many mines of this class are making no profit.

The Cœur d'Alene mines are reported as doing very well this season, and recovering from the evil effects of their boom of two years since. New River has, so far, not come up to expectations, very little development of note having occurred.

General business continues rather dull throughout the country, but it is hoped the depression will not last much longer.

COMMERCIAL statistics for the first half of the year 1885 are now made up, and it is seen that notwithstanding the dull times we have done more business in the past six months than in the corresponding period last year. Our exports of wheat in round numbers for the cereal year just closed were 15,974,000 cts., valued at \$21,278,000 against 11,256,000 cts., at \$19,147,000, in 1884. The exchanges at the San Francisco Clearing-House for the first half of 1885 amounted to \$273,649,000, against \$267,959,000 in the first half of 1884. These clearings are now accepted as the nearest guide to the volume of business, and they show that we have done about \$5,500,000 more business thus far this year than in the corresponding period last year. True, the gain is slight, but it is much better than a loss.

The Northern States of Mexico.

It is stated that plans have been submitted to the United States Government having in view the sale to this country of some of the northern territory of New Mexico. The most popular of the plans put forward is the purchase of Tamaulipas, Nueva Leon, Coahuila, Chihuahua, Sonora and Lower California. The value of the territory comprised in the above six States is estimated at from \$100,000,000 to \$300,000,000. The second scheme provides for the sale of Sonora, Sinaloa and Lower California only. A mass meeting is to be held in Santa Fe, called by many representative Spanish-Americans, to endeavor to get our Government to send a commission to Mexico to treat for the purchase of Chihuahua, Sonora, Durango and Coahuila.

Without attempting to discuss the point as to whether our people desire to add more territory to our already extensive domains, or whether this is the best use we can make of idle millions now in the Treasury, it may be said that should anything come of the schemes the result would bring under our laws a vast amount of mining region only partly prospected or worked. A number of mines are being worked in Durango, Chihuahua, Sonora and Coahuila by Americans, but they have great difficulty in conducting operations under existing conditions. In case the territory should belong to the United States thousands of miners would go there, and a speedy revolution of present systems and customs would result.

There are undoubtedly rich mines in the mountains of the regions referred to, which have been worked in a rude way for several hundred years. There are also many which have been abandoned because the Mexicans could not cope with the water with their crude systems and lack of machinery. Moreover, there are wide ranges of country unprospected to any extent, which would be fine fields for our mining population. There are some drawbacks to mining thereabouts, of course, but many of them would soon be removed by American enterprise and energy.

Speculative Exchanges.

One of the results of the general business depression has been in the East to seriously effect the various speculative exchanges and the value of memberships therein. The value of seats in some of them has fallen to one-third of what it was not long since. The disinclination of "outside" people to deal in margins in the New York Produce Exchange has left brokers with few orders, and they are compelled to deal on their own accounts. They are beginning to think there are too many members.

Perhaps, also, there are too many speculative exchanges of various kinds. We have our share in this city, but they have not the influence they used to exercise. The gambling in mining stocks here which used to be indulged in by all classes of people, is now confined among those who cannot give up the idea of gaining sudden riches by this means, or those who, having money, can afford to speculate. But so many people on this coast have received severe practical lessons about dabbling in business out of their control that the speculative exchanges interest them no more.

Of course there are certain people who will speculate, come what may; and as a nation we are somewhat given to it. But it seems that all over the land the impression is gaining ground that it is an expensive luxury in which only the rich should indulge. Certain it is that here at least many have become cured of the mania; and it appears that in the commercial centers East the lesson has also been learned.

It is as well for those of moderate means to think twice before launching their earnings into speculations of any kind. There are plenty of legitimate channels for investment, where, if the profits are small, the principal is at least comparatively safe, and in a tangible form.

BUSINESS is said to be picking up at a lively rate in the little mining camps adjacent to the line of the Carson & Colorado railroad. Tri-weekly shipments of bullion are made from Marietta, and another mining company in that camp has recently put on a force of 20 men. At Candelaria the Columbus and other mines are to be started up in a short time which are known to contain bodies of high grade ore.

Fossil Elephants in California.

That both mastodons and mammoths once existed in California there is no doubt, since several finds of their bones in a fossilized condition have been made. No complete skeleton has been exhumed which could be set up in a museum for exhibition, owing to the fact that in most cases the bones have been more or less scattered, portions have been missing, or else what have been found soon crumbled when exposed to atmospheric influences. A deposit of bones of a mammoth has lately been opened in Yolo county, and the remains have been carefully removed and brought to San Francisco, where they have been placed in the museum of the California Academy of Sciences, Mr. C. D. Gibbs, by authority of the Academy, and in its behalf, visited the deposit last week.

The situation is in the Sacramento valley, about 12 miles from the foothills of the Coast range, 60 miles from San Francisco in an air line, and six or seven miles from Dixon, Yolo county. It is on the ranch of Hecht Bros., and opposite that of Montgomery S. Currey. The bone deposit is on the dry bed of the creek on the north side of a shallow stream about 40 or 50 feet wide, flowing through the center of the creek bed, which is about 150 to 200 feet wide.

In his report to the Academy, Mr. Gibbs states that Mr. Hecht discovered the bones two years since on a point of land in the bend of the creek that had been carried away in the great flood three years since, sweeping off two or three acres to a depth of 20 feet. Some of the large bones Mr. Geo. W. Pierce had taken out and given away to Mr. J. B. Hollingsworth, of Woodland. Mr. Gibbs reports that the bones are not in the bluff bank but are resting on a blue clay or mud, under a yellow clay, 30 feet from the present stream, which was once the margin of the north bank, and are 70 feet from the bluff on the present left, or north bank of the creek. The bones are about three feet above the level of the stream, and the bluff bank 20 or more feet above the bones. This being the deepest part of the bend makes it 100 feet of earth, over 20 feet in depth, that was cut off and carried away by the flood.

Fifteen or sixteen feet in depth from the surface the soil is a sandy loam, then a yellow clay seven or eight feet thick, resting on a blue mud or clay. Most of the yellow clay was carried off by the flood, leaving about 12 or 15 inches above the bones, but cut in small channels or grooves by the water, and in one of these channels the bones were exposed. There was a grove of large oaks on the surface above the bones before the high water referred to, and the north bank is still lined with large oaks above and below.

The yellow clay is intersected by a complete network of hard seams of a white calcareous deposit, and in some places a solid mass 10 or 15 feet in diameter, resembling a honey comb, as if a pool of water had evaporated, leaving these specimens. At the first view over the ground it had the appearance of numerous bleached ribs, and other bones imbedded in the clay, and these seams made it difficult in excavating to distinguish between the bones and this calcareous deposit.

The impressions of the large bones taken out by Mr. Pierce still remained on the blue clay, and Mr. Gibbs commenced work at the upper end of the bumerus, near the shoulder, as it was desired to obtain the jaw, or at least a tooth. The work proceeded slowly, as they had to dig with a knife carefully all around each bone to loosen it from the tenacious mud and clay in which it was imbedded; yet even with the greatest care, many of the bones broke. Several fragments of ribs and other bones were uncovered, some imbedded under and across others. It became evident, from the result of digging, that the head had been above the level of the other bones, and had been washed away in the upper portion of the clay bank. It may yet be found further down stream. As far as can be judged, Mr. Gibbs thinks the animal must have been lying on its right side, with its head up stream. The elevation above sea level is between 45 and 50 feet. One of the bones found by Mr. Pierce is a humerus 2.2 feet in length, and the other a femur, 3.2 feet long. No teeth were found, so it could not be stated whether the bones were those of a mastodon or a mammoth. Mr. Gibbs is inclined to think it was a mastodon. A large number of the bones are now at the Academy

museum. While on his way back to this city, he stopped at Martinez, as requested by Prof. Davidson, President of the Academy, to examine certain large teeth which had been found there. What had been supposed to be three large teeth of a mastodon, found by Mr. Martin Woolbert, proved to be a portion of the tooth of a mammoth, split in three pieces, and not whole teeth. Mr. Gibbs also examined the tooth found by a son of Mr. Jones, which is in a better state of preservation. Both were found near each other on the beach below high tide, near Mr. Woolbert's, a mile east of Martinez. Mr. Gibbs visited the spot, and though the tide was partly up, they dug under the sand and found yellow clay on blue mud. One of the teeth, supposed by Mr. Gibbs to be that of the *Elephas Americanus*, has been presented to the Academy.

New Dry Ore Separator.

Joseph Behm, of San Jose, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an ore separator and concentrator, into which the ore is received after having been properly pulverized. From a hopper the ore passes downward through an inclined passage and is discharged into a vertical cylindrical chamber, through which a vertical shaft extends, having a suitable step, journal-box and driving-gear. Upon this shaft is fixed a disk just below the open end of the cylinder. The rapid revolution of this shaft and disk causes the pulverized material to be thrown outward within the larger inclosing-cylinder, the finest portion of the dust being drawn upward and over the upper end of the cylinder by a suction fan, while the heavier portions will fall into a hopper beneath the open bottom of the cylinder, and may discharge outward by a spout in its inner end.

The disk has an inclosing sleeve where it passes up through the cylinder and thus protects the shaft from the wear and attrition of the material, which is fed into the cylinder around it. A second sleeve also surrounds the shaft, which passes through the hopper. The distance between the disk and the bottom of the cylinder is subject to regulation, so as to control the discharge of the material from the cylinder.

The fine dust is drawn upward over the top of the larger inclosing-cylinder by a suction fan which is situated at the end of a passage which has a series of boppers or chambers formed in it. These passages are also provided with diaphragms which serve to prevent the air and dust from passing in a direct line to the fan. The diaphragms divert the current downward, so that any material which is heavy enough will be retained in the chambers. These chambers are graduated in size, those nearest the inlet being made smaller than those which are more distant, in order to produce a stronger current through them at this point. This is necessary by reason of the greater specific gravity of the ore which is deposited in the first chambers, and the strength of the air draft lessens toward the outlet as the chamber increases in size, the deposited material being lighter.

The material which is deposited in the different chambers may escape automatically through doors or valves at the bottom, which may be kept closed by springs or weights until the weight of the material within overcomes the springs, when it discharges, after which the doors are again closed.

The finest portion of the dust is carried through the fan-case and is discharged into a large dust chamber from which it may also be withdrawn through suitable openings at the bottom. From the top of this dust-chamber a pipe or passage connects with another suction fan. This passage is in the form of an inverted cone or pyramid, having its base connected with the top of the chamber and the opening is covered with a fabric of some fibrous material, which, while allowing the air to escape, will arrest any dust which may be drawn upward by the action of the second suction fan. The material thus arrested in the chambers may be further concentrated by being discharged from these chambers into a second apparatus, which operates in the same manner as the ore described. The ore is thus graduated in fineness and separated into as many grades as may be desired, all that is too coarse for further operations being again returned to pulverizer. The machine is quite simple both in construction and operation.

Auriferous Sea Sand.

[Written for the MINING AND SCIENTIFIC PRESS, by C. H. AARON.]

By the kindness of a friend I obtained two samples. The first was only a few ounces; it contained 0.7 ounces of gold in the ton. An experiment in amalgamating the gold by a new process of my own resulted in the extraction of just one-half. This was not satisfactory, but, as the material was exhausted, I could do no more with this sample.

Having reason to think that this kind of sand offered a field for further experiment, I procured another and larger sample from another locality, I believe, but of the same general character; it, however, contained only \$2.60 to \$2.30 per ton by two assays on 1,000 grains each, average \$2.45.

Taking 1,000 grains of the sand the following results were found: Separated by magnet, 333.3 grains; separated by 80-mesh sieve from non-magnetic residue, 219.2 grains; passed through sieve, 447.4 grains. The three portions were separately smelted; the first and second yielded no gold, the third non-magnetic matter, which passed through the sieve, gave 0.0045 grains of gold, or \$2.60 per ton for the original material, or \$5.80 for the concentrate. Taking another 1,000 grains and proceeding in the same manner I got

Magnetic sand containing no gold	332.0
Coarse matter containing no gold	213.4
Fine sand containing 0.004 gr. gold	454.0
Total	999.4

This was considered conclusive as to the possibility of concentration, without loss, to less than one-half; having no finer sieve I could not ascertain the limit.

A thousand grains thus concentrated to 415 grains was carefully vanned, the heavy black sand, though not magnetic rendering this a tedious and difficult operation and doubtless causing some loss. Half a dozen specks of gold were found which appeared, under the lens, as clean little chips as one would wish to see. Nevertheless the gold utterly refused to attach itself to a globule of mercury. Addition of potassium cyanide solution was without effect during several minutes, but, on washing that away and replacing it by a drop of my reagent, amalgamation took place in a few seconds. I do not mention the character of this reagent, because, though rather promising, its practical utility is not yet established, and should it prove valuable I may possibly derive some much needed revenue from it. The gold thus collected amounted to only one-fourth of that which the material contained, according to the previous assays.

Treating 3,500 grains of the sand, not concentrated, by amalgamation with the aid of the above reagent, I extracted just half of the gold value. This, if not a mere accidental coincidence, is interesting as being exactly the same result as was got in a similar experiment on the previous and richer sample. Taking 7,000 grains I got

Separated by magnet	Grains.
Passed sieve	2723.7
Refused sieve	3441.1
Total	6164.8

That which passed the sieve was moistened with water in which two per cent of salt and a little magnesium sulphate were dissolved, in order to roughly imitate the composition of sea water. It was then treated with chlorine as in Plattner's process, and yielded 0.027 grain of gold, which was a satisfactory result.

The portion which had been separated by the magnet was similarly treated; it yielded no gold. The magnetic sand did not appear to have been affected by the chlorine; it remained magnetic, and the leach contained little if any more iron in solution than that from the other portion.

In these small operations in chlorination, it is not feasible, without special apparatus, to confine the proportion of manganese, etc., used to that which may be profitably employed on the large scale, consequently the question of economy, so unimportant in a mere chemical

experiment, but vital in practical metallurgy, remained, so far, an open one. In order to settle this as well as my scanty means permitted, I took 7,000 grains of the sand and, after moistening it, placed it in a glass funnel upon a bed of broken glass, as indeed I always do in testing by the Plattner process. The beak of the funnel was luted into the neck of a flask containing 35 grains ordinary manganese binoxide, 45 grains commercial salt, and 100 grains commercial sulphuric acid; also a little water. The funnel was covered with a piece of paper, tied on, and having a small hole pierced in it. A wash-bottle was dispensed with in this experiment in order to save "dead space."

In the course of two or three hours the chlorine had permeated the moist sand and issued

cost of handling the material in charging and emptying the leaching vats, and of bringing it to the proper condition as to moisture. Secondly, the leach from a vat would contain so little gold to its volume as to offer difficulties in the collection. Both can be overcome.

A pound of the sand, not concentrated, was steeped for about 10 hours in chlorinated (imitative) sea water; it yielded 66 per cent of its gold. It would doubtless have yielded all with stronger liquor and a continuous current of that.

As to concentrating or not concentrating, that would depend on circumstances. If the magnetic sand could be sold, its separation would surely be advantageous, and would probably be so under other circumstances where it constitutes one-third of the material and con-

livered where required. From the sluices the stuff would pass through the revolving sieves, or trommels, where the coarse sand would be separated. The fine sand and gold would again flow through launders to the leaching vat until that should be charged, when the stream would be diverted to another. The water being drained out of the vat, chlorinated water, which might be sea water, would be passed in, and, percolating the sand, would pass to another and to yet other vats, with a reinforcement of chlorine if required, and would issue finally as a moderately strong and ever-flowing stream of gold solution, from which there would then be no difficulty in separating the precious metal. When the first vat was exhausted of gold, the initial stream of chlorinated water would be applied to the next, thus making that the first of the series, while the exhausted vat, emptied and recharged would, by suitable connection become the last. Thus all the chlorine would be utilized, and all the gold would be extracted.

The emptying of the vats could be done by shoveling at small expense, or it might be done automatically. Of course the plan involves many details into which I cannot now enter.

I cannot judge of the expense of collecting the sand and placing it above tide-water (the rest of the elevation could be done by machinery), but, if that can be effected at a cost of from 50 to 70 cents per ton, even the low grade of material on which I experimented could, I think, be made to pay a profit of a dollar a ton, and better sand can be got. It would be necessary, however, to work on a large scale, and with a thoroughly equipped labor-saving plant. My friend, who sent the samples, says San Franciscans won't do anything of the kind, "they want gold for a circulating medium, but you must not produce it."

A Cable Railroad Edition.

We shall next week issue a double sheet edition of the MINING AND SCIENTIFIC PRESS devoted to the cable railway system so extensively in use in this city.

This number will contain detailed descriptions of the local roads now in operation—the Market, Haight and McAllister street, Presidio, Clay, Geary, Sutter and California streets, and some description of Eastern lines. The details of construction and operation will all be considered, and all the desirable information concerning the subject will be gathered. This edition will be very fully illustrated with plans, drawings, etc. All the new improvements in the running of the cable roads will be given. In addition we shall have articles embodying the engineering features of the road. There will also be descriptions of the new and improved appliances of recent invention adapted for use on these roads.

We shall print a very large edition of the number of the PRESS referred to, as the subject is one of such great interest to so many persons. The cable system for the propulsion of street cars is rapidly being introduced into other cities in this country, Europe and Australia. But as it had its inception in San Francisco and is most largely used here, carefully illustrated descriptions of our local roads will be useful to engineers and the public everywhere.

Those interested in cable roads, and desiring extra copies of the double number of the PRESS should send in their orders without delay.

Water Wheels for Quartz Mills.

The use of water for power is one of the factors which has reduced the expense of gold milling in this State of late, and wherever practicable it has been adopted. In some places the water has been brought a considerable distance in pipes or flumes, at great expense, a saving being made in the long run. In this State what is known as the hurdy-gurdy wheel is the favorite, as it is especially adapted to high heads, and is one of the most simple and efficient wheels in use. The two forms of hurdy-gurdies mostly in use are the Knight and the Pelton wheels, the latter a more recent invention, and one which has met with decided success, and especially in quartz mill work. It is not only used in many mills in this State and on this coast, but some have been sent to South Africa, Valparaiso, New Zealand, Alaska and elsewhere.

The engraving on this page shows one of these Pelton wheels, with automatic governor, as adapted to run a 60-stamp quartz mill, built by the Risdon Iron Works of this city. The wheels are adapted to drive air-compressors, pumps, saw-mills, hoisting machinery, factories, mills, printing offices, etc.

ARRANGEMENT OF WATER WHEEL TO RUN A 60-STAMP MILL.

through the cover. By applying a gentle heat to the flask, at intervals, the gas was several times caused to issue instantly and copiously from the hole in the cover. On leaching the ore the next morning, the smell of chlorine was distinct, but not as strong as was desirable, which, however, may have been due to the imperfect covering of the funnel. The yield of gold was not determined, but was evidently less than it should have been had the whole been extracted. This may have been due to the escape of chlorine by diffusion, to the insufficient moistening of the sand (for this comparatively coarse gold), or to the absence of a wash-bottle, allowing acid fumes to reach the ore. On the whole, and judging mainly from the readiness with which the chlorine was repeatedly caused to issue from the funnel, it is my opinion that this sand would require no more than the usual proportion of material for its treatment by chlorination, that is, in San Francisco, from 60 to 90 cents worth per ton. By concentration of the sand, the cost of the extraction would be reduced more than half.

In considering this matter, two practical difficulties present themselves. Firstly, the

tains no gold, as in the instance under consideration. The separation might be effected by means of Edison's very simple apparatus, though I have some doubts of its suitability for the purpose. I have myself contrived a machine, almost as simple as Edison's, in which small permanent magnets would be used, instead of electromagnets; it will separate the magnetic matter continuously, rapidly, and, I believe, with sufficient completeness. The sifting, by which at least another sixth of the material can be removed without loss of gold, may be omitted, or performed also continuously and quickly by well known means.

Granting that concentration would be employed, and otherwise it would make no difference in the manner of subsequent treatment, the auriferous sand would be collected on the beach, transported to a point 30 feet above tide-water, and beyond the reach of surf, and dumped into a large bin. From the bin the sand would be removed continuously by means of jets of water thrown in near the bottom. The sand and water would flow continuously through inclined launders, and in its passage the magnetic portion would be arrested and de-

Mining in Mexico.

Coal Fields Being Opened in Sonora.

From a letter by John I. Ginn in the *Oakland Times*, written at La Trinidad, Sonora, Mexico, we make the following extract:

Your correspondent has been wandering about for the past two months, and hence has not at all times been in mail communication with the "whits settlements." A good deal of that time was spent about Los Bronces, San Xavier, La Barranca, Tarumari, Toniche and other places west of and along the Yaqui river. While west of the Yaqui I spent a good deal of time in examining the anthracite coal fields and silver, gold and iron mines of the eastern slope of Los Bronces range of mountains.

The Coal Fields of that Region

Are something wonderful, and are destined, ere long, to revolutionize the fuel trade on the Pacific Coast. I found by examination and comparison that that field (for the coal seams are continuous from the summit of Los Bronces range to the Yaqui river) contains 108 square miles more superficial area than all five of the anthracite coal basins or fields of Pennsylvania, and within 12½ miles square of the aggregate area of all the coal fields of England. The coal, too, of even superior quality to the anthracite of Pennsylvania, having 90 to 92 per cent of fixed carbon, 3½ to 5 per cent volatile combustible matter, 4½ to 5 per cent of ash, and leaves no clinkers on burning. No prospecting for coal has ever been done in this field, all the discoveries yet made being through aqueous erosion, and even those exposed by meteoric agencies have been worked but little—just sufficient to furnish coal for local consumption by mining companies operating machinery in the immediate vicinity. One silver mining company has, in the past twelve years, consumed over 20,000 tons from a single seam. But, even in the absence of prospecting, the number of

Workable Seams Exposed

is very great—many of them being four to five feet thick, several ten feet, and some as much as sixteen feet thick of clean coal. The seams run north eighteen degrees east, and dip easterly at an angle of thirty two degrees. No crosscuts have yet been run to ascertain the vertical thickness of the intervening strata, but where crosscut canyons are not denuded of the breccia sheet which originally overspread nearly the whole of Sonora, the coal measures of the field, taken in descending order, are as follows: Aqueous breccia and conglomerate, gray sandstone, clay-slate, shale ornate with fossilifera of the coal period and impregnated with carbonaceous matter next to the coal, impalpable fire clay, then again sandstone, slate, fossiliferous shale, coal, and so on in the same order of recurrence until veins of iron ore displace the seams of coal along the western border of the uplift. In these underlying strata of the coal fields are veins 4 to 20 feet in thickness of singularly pure brown hematite iron ore, of the compact variety known as clay-ironstone, the purest of which carries from \$14 to \$32 in silver to the ton, while an impure iron ore of the same variety constitutes the veinstone or gangue matter of the rich silver mines known as the Prieta, Los Bronces, Division, Cruceros and the Sierra, all situated near the summit of the range and occupying fissures cutting the coal measures at various angles to their trend—these argentiferous iron ores paying from \$90 to \$3,000 and \$4,000 in silver to the ton.

English Capital in Sonora.

The greater or more valuable portion of this splendid anthracite coal field has already been purchased by English capitalists, and a company is now in process of formation in London for the purpose of building a railroad from the port of Guaymas to Los Bronces, 105 miles, and opening and working the coal mines on a large scale. Another English company, the Silver Queen United (limited) has been incorporated to work three separate groups of silver mines at Los Bronces. The property of this company embraces four adjoining mines at Los Bronces proper, two adjoining, and one mile distant from the first group, and two others adjoining in and forming the third part of a triangle, a 20-stamp mill, seven 10-ton leaching tanks, three 1,000 gallon solution tank, four triple-floor chloridizing furnaces, refining furnaces and other accessories, two sets of steam-hoisting works, one square league of land and numerous buildings, water-works, etc. La Trinidad (limited) is also a London company, and the pioneer English investor in this part of Sonora, having purchased the munmoth mine of this place last September. This mine has been more than paying its way since the new company took hold of it, although both the hoisting and reduction machinery was nearly worn out, and not capable of handling more than eighty tons of ore per day. New machinery has just been constructed at and is on the way down from San Francisco, as follows: Reduction, concentration and smelting works, at a cost of \$200,000; hoisting machinery, \$40,000; suspension wire tramway for the transportation of coal, wood and mining timbers, \$25,000; steam saw-mill, shingle machine, planing machine, etc., \$15,000. This company has also recently constructed about \$20,000 worth of new buildings, and has just completed, at a cost of \$50,000, from Ortiz, on the Sonora Railway to La Trinidad, 165 miles, the first wagon road ever built into the Sierra

Madre mountains from the plains of Sonora. The prospects of the mine more than justified the expenditure of this \$550,000, in addition to the \$2,000,000 paid for the property, even before the new management began deeper explorations, but now La Trinidad seems destined to soon become celebrated as the greatest silver mine the world has shown. The vein is 335 feet wide at the surface, and on the fifth level it shows a width between walls of 480 feet. The country rock is a hard porphyry, while the veinstone or gangue is a soft or decomposed gray porphyry, with some calc spar, but scarcely a flake of quartz—a peculiarity of many of the richest mines in this portion of Mexico. The silver (there is scarcely a trace of gold in the ore) is found in the sulphuret form, with long wisps and great globes of wire silver, and broad ribands and massive sheets of native silver traversing the gangue in all directions, associated with gray copper (10 to 12 per cent), a small percentage of galena near the surface, bisulphuret of iron, etc. From the fifth or 500 foot level upward the ore has been reckoned at from \$35 to \$60 in silver to the ton. On the fifth level, however, a chamber 110 feet long, 60 feet wide and 30 feet high has been excavated in ore paying from \$1,000 to 1,100 per ton, and now, on the 750-foot level, a breast 15 feet long and eight feet wide has been carried 20 feet in apparently free milling ore carrying from \$1,200 to \$4,000 in silver to the ton. This latest rich strike is about 200 feet from the hanging wall and near the center of the lode, about 500 feet south from the main shaft, and immediately under the extensive surface workings of the miners of antiquity. Heretofore the copper in the ore has not been saved and, in fact, but 50 to 60 per cent of the silver, but the new reduction works, having a capacious copper-silver water-jacket furnace, is calculated to save about everything of value. Still the company, which is not a speculative but a working one, as most English companies are, modestly estimates the future output at only \$3,000,000 in silver and \$500,000 in copper per year.

In the Sierra Madre.

George Cummings, a young man well known here, returned this week from a prospecting tour in that portion of the Sierra Madre in which General Crook was captured by the Chiricahuas two years ago. Ever since that time prospectors have fancied that it was one of the finest mineral countries in the world, and have only been deterred from entering its hidden precincts by fear of the Apaches. But George and his partner had become so thoroughly imbued with the idea that they concluded some mouths since to invade the wilds and take their chances. After a tedious journey they reached the foothills and boldly entered the wilds whose soil had never been trod by the feet of white men except those of Crook's small command. They penetrated to the very heart of the wild region, and spent seven weeks in a fruitless search for the rich veins it was supposed to contain. They found any number of low grade ledges, none of which could be worked at a profit, owing to their inaccessibility and great distance from the lowlands. It would be necessary to build the most expensive roads, over a hundred miles in length, to reach the mines. The country is very rugged, and scarred and seamed by impossible gorges, through whose gloomy depths flow tiny rivers over high falls and among huge boulders dashed down from the mountains' almost perpendicular sides. In many places they were compelled to lead their animals for days, and even then it was difficult for the poor brutes to ascend the abrupt hills. But in the very heart of this rugged region they found, in little basins, the remains of villages that had evidently been destroyed by the red-handed Apaches centuries ago, for in the ruins of buildings stand the largest size of mesquite, a slow-growing tree. The trails leading to and from these ruined villages have been entirely obliterated by the elements. The mountains are full of good pine timber and cool crystalline water, and abounded in game of all kinds, deer and turkeys being marvellously abundant. Feed for animals is apparently inexhaustible, and the climate is simply delightful at this season of the year. Taking everything into consideration, George does not wonder that the Chiricahuas should select it as their refuge. It is the finest country in the world for ambuscades and strategic warfare. A handful of men well acquainted with the region could cope successfully with a large army. George and his partner came out of the range by way of Nacosari, and passed the mining camp where the three Americans were murdered by the renegades just two days prior to the occurrence of that tragic event. They then took the trail for Arizona, and crossed the line near Bisbee. At Nacosari they heard of the Indian revolt, and felt greatly relieved when they discovered that they had left the Sierra Madre just in time to save their scalps. George says he is content to prospect in Arizona hereafter, and will leave the Sierra Madre to others who may think the rich mines are just in the beyond. He says all the American companies operating mines in the vicinity of the Yaqui river have failed and are becoming disgusted with the country.—*Enterprise*.

THE early-closing movement which started at New York has got as far south as New Orleans and as far north as Montreal.

Borax.

The price of commercial borax has greatly decreased during the past three years. It can be bought now for half what it cost in 1882. Then the market rate was 11 cents a pound, and at the present time it is 5½ cents a pound. This falling off in prices has continued, notwithstanding the imposition of a tariff which virtually prohibits the importation of borax and boric acid. It has been due, therefore, to this consumption not keeping up with the supply. The production of borax on this coast, which is the only part of this country where it is found, has been steadily very large. Last year 4,500 tons were extracted by the various borax mining companies in this State and Nevada. Its use has not grown more limited, but it has not kept pace with the production. It is employed in welding, glazing, pottery and cleansing. The iron trade consumes the largest quantity of borax, and with the increase of that industry the business of borax mining will be benefited. New uses are being found for this mineral. At first it was thought fit only for iron-workers and blacksmiths. Its detergent properties were revealed afterwards. The manufacture of glazed iron and earthen-ware was begun after other virtues were discovered in borax, and now it is employed in packing metals in Chicago. Notwithstanding the supply from Italy, large quantities of borax are exported to Europe from the Pacific Coast. Last week 775,000 pounds were shipped from this port to Liverpool. Some of the London illustrated papers contain flaming advertisements, in true American style, lauding the virtues of soaps made from California borax. Boracic soaps and borax in the shape it comes from the mines are admirable cleansers. A piece of borax dropped into water renders it pleasant to wash in. The supply on this coast is practically inexhaustible, as when crude borax is removed from the fields where it is found a renewal of it ensues. So important is this industry here that Sackville Nest, the English minister, recently made it the subject of a communication to Earl Granville. Most of the mineral deposits of this region carry borax in a crude form, and consequently there are many horates from which the pure borax is obtained. The crude borax of this coast is of a high quality. The largest supply comes from Teel marsh, in the Candelaria district, Nev. This field has been worked the longest and has given the greatest yield of any on the coast. There is a big marsh, twelve miles long, in San Bernardino, and several in Mono, Lake and other counties. The depression now existing in the borax trade will, it is thought, gradually be removed.—*Chronicle*.

SHELBOURNE.—Peter Lovell, lineman for the Western Union Telegraph Company for Eastern Nevada and Western Utah, returned to town on Monday last from Shelbourne, where he has some very promising mining claims. Shelbourne is on the old emigrant road, some 15 miles east of Cherry Creek, and although the place has but a few inhabitants to-day, it had in 1871-'72 a population of upwards of 800 people. The camp sprang into existence with one bound, so to speak, and notwithstanding the surrounding mines gave promise of good returns, yet in the midst of this most encouraging hopes on the part of the town's denizens an exodus to Cherry Creek and other new camps close by set in, and it continued until, like many other relics of mining camps to be seen to-day in the State and on the coast, all that remains to tell of its former greatness are a few stone walls and the foundations of what were probably substantial buildings. Mr. Lovell has great confidence in the properties there that he still retains, and on some of them he holds United States patents. From the Summit mine, in which he and Henry (commonly known as "Salty," from the fact of his owning large salt marshes in the State) Williams are interested, several pieces of ore fresh from new explorations in the property were brought in, and the same being assayed were found to contain precious metals to the value of \$500, \$890 and \$1,010 a ton. Altogether both gentlemen named feel quite certain that the old camp will yet vindicate itself, but it will be when a class of men go into it and prosecute work with judgment and practicability. Too much dead and senseless work has been done during its brief palmy period, and it was to this, in a great degree, that the camp was allowed to decay.—*Eureka Sentinel*.

GREAT DEMAND FOR ARSENIC.—Til. Burke reports that his house has sold 700 pounds of arsenic since Saturday, while he has orders on hand for some 400 pounds more. A prominent San Francisco drug store has sent 2,000 pounds of arsenic into the valley in the past few days. Frank H. Ball & Co. also report large sales of this drug. This gives some idea of the onslaught that is being made on the grasshoppers. The preparation suggested by George West is found to work like a charm. The hoppers eat it whether wet or dry, and rather seem to like it, and there is no danger of their communicating the poison to the fruit or anything of that kind, as they never fly after eating it, simply contenting themselves by crawling off and bunting a shady place to die at.—*Fresno Examiner*.

A CEDAR log was struck at San Bernardino, while sinking an artesian well, at a depth of 105 feet.

Cleanliness About Railroad Cars.

General Superintendent Smith of the Union Pacific Railroad has issued a circular, in which he calls attention to the necessity for a rigid enforcement of the company's rules regarding cleanliness, in view of the probable appearance of cholera in this country. Railroad officials and employees are reminded that the most important means of preventing disease is cleanliness—cleanliness not only of the person, but of the surroundings, as no disinfectant, in the superintendent's opinion, can take its place. He says that all shops, stations and adjacent grounds should be kept scrupulously clean and neat, and decaying animal or vegetable matter should be burned or buried. Closets should be scrubbed with soap and water as often as once in two weeks, and drains and sewers should be flushed with water as often as once a week if the water supply will admit. Passenger cars should be thoroughly cleaned and ventilated and the plush beaten frequently. The closets and floors of passenger cars should be washed as often as once a week and the Union Pacific disinfectant used thereon according to the printed instructions furnished with each package. Freight cars should be cleaned before loading. Mr. Smith calls attention to the fact that stockyards, corrals and outlets of drains are often so located that the drainage from them finds its way into the water supply, and he directs that, when practicable, springs, where the high land surrounding them was pure drainage, should be selected. The circular contains the following paragraph:

If a case of infectious disease is found at stations, or elsewhere on the company's property, a physician should be immediately sent for; if in cars, such cars should be removed from the train as soon as practicable, the doors locked, and should not again be used until fumigated in accordance with the printed instructions of the chief surgeon.

It is further stated that refuse from telegraph batteries form a good disinfectant, the residue to be mixed with common salt in the proportion of one and one-half pounds of salt to a gallon of residue.

All employees are expected to heartily co-operate in keeping the premises of the company clean and neat at all times.

MINING AT PLACERVILLE.—Mining operations in this immediate vicinity are at present lighter than they have been since the first discovery of gold here, or at least fewer men are employed in mining than at any previous time since the first discovery of gold here, and yet we have one of the best fields to prospect on the coast. The Placerville Gold Quartz has a fine property and a most excellent plant, but there is a hitch among the owners, causing it to lie idle. They are on a belt that is positively known to be rich. A few thousand dollars spent in prospecting the mine cannot fail to develop a rich ore body, and we are confident that the time will come when from 50 to 75 miners will be employed in the mine at an immense profit to owners. The Young and old Harmon property is another that will be eventually worked at great profit, but the ten or twelve thousand dollars that will be required to thoroughly open the property and put it on a paying basis is the drawback at the present time. The Reid mine is another property that promises well for a brilliant future, but it seems impossible at present to get capitalists to take hold of the most promising properties here, and the chances are that until our own citizens come to a better understanding in regard to the development of our resources, we must stay at a stand-still. We have it in our own hands to build ourselves up or tear ourselves down at present, but the time will surely come when all obstacles will be removed, and Placerville become the most prosperous town in the mountains, as it was years ago.—*Placerville Herald*.

A NEED.—The importance of the proper development of our widely extended fields of mineral, is sufficient to justify the government in establishing at different points schools or stations for the purpose of demonstrating the best methods of mining and treating the ores of each locality. The field is so broad and diverse, that the knowledge acquired in one locality, is often practically unavailable at another, hence the necessity of qualified scientists who are able to adjust themselves to the requirements of any location. The establishments of fish commissions and of weather reports form a sufficient precedent for the inauguration of this system, in a field vastly more important, the results of which would be permanent and lasting, and valuable for reference and instruction, so long as there was demand for their absolute existence. The results, thus obtained, in fact, become a part of the permanent knowledge of the people, forever valuable. The discovery, analysis and classification of a mineral, or the discovery of an agency which can be economically supplied in its treatment and use, becomes a permanent factor of value, which compared with report of the direction of the wind or probabilities of rain or sunshine, is worthy of consideration.—*Mining Review*.

It is thought that attempts have been made to cut the boom which holds several million feet of lumber in the Sacramento river at Redding, and the watchmen have received orders to shoot the first man seen prowling about the place after dark.

From Fresno County.

EDITORS PRESS:—I think I have found the great mother lode of gold-bearing quartz that runs from Trinity to Kern river. It lies here, about 30 miles east of Fresno City, in Fresno county. The people hereabouts do not take much to mining and think a man insane who is interested in quartz. As, however, I come from the Silver State of Nevada, I pay little attention to their talk. They have the impudence to tell an old Californian the mines are played out. If they would read your MINING AND SCIENTIFIC PRESS they would shudder at their folly. But as I am nothing but a poor prospector I have found a rich gold lode, in ground they have run over since Fresno county was settled by the Anglo-Saxon race. My mine lies directly above the granite formation, where it comes in contact with the slate. The gold is fine and almost pure. I can easily trace it a distance of six miles. It shows it is no blow-out on a common pay chute. There is plenty of wood and abundant water for milling and mining purposes. I wish some good man would come and see it. Please publish this in your valuable MINING AND SCIENTIFIC PRESS for the benefit of the wayfaring prospector and the future development of the quartz mines of California.

J. W. SUMNER.

Fancher Creek, Fresno Co., June 24, 1885.

The Need of Capital.

The great need of all new mining camps is capital. Prospectors who, after patient search and privations, with scarcely enough food to keep from starving, find districts which they deem of value, cannot develop them, and unless capital comes along to sink shafts, run drifts and put up machinery, the richest mines must remain idle. In a district as new as the *Coeur d'Alene*, there are tempting prospects for moneyed men to take hold of. All about us are ledges of quartz—gold, silver, copper and lead—which show as well on the surface as those of any camp ever discovered on this coast. Many of these prospects exhibit veins of ore that promise, with development, to become the best of bonanzas. The *Coeur d'Alene* is a perfect network of rich mineral-bearing veins. They are not confined to one spot, but run from the lake east for a distance of forty miles, and from ten miles north of Murray to twenty miles, and perhaps more, south. Here is an unlimited field for capital, and never were better opportunities presented for investment. Labor and living are cheap, and the facilities for working mines were never more advantageous. For reduction works especially there is an opening seldom equaled. There is lots of idle capital East and West. Let its representatives come and examine our claims.—*Coeur d'Alene Sun*.

RIVER MINING BY CHINESE.—A traveling correspondent of the *San Francisco Report*, who has been doing the upper part of Nevada county, tells what he saw and learned of the river mining now being done by Chinese miners along the Yuba: At Bridgeport, where I crossed the South Yuba, the river was running pretty thick and white with debris. There was not much water in it, and what there was showed that there was still some debris in the stream above. In following the river, I could see that many Chinamen were at work mining along its course, and I was informed that above this crossing as far as Omega, which is far above Bloomfield, they occupied the river in squads at every convenient place. This is also the case, I believe, along the Middle and North Yuba rivers, as it is along the main Yuba nearly down to the Narrows at Smartsville, some 12 or 15 miles below Bridgeport. These people do not own these river claims; they are located by white men, and the Chinamen lease them from the locators, paying pretty roundly for the privilege. None of these river claims will pay for white labor at \$2.50 per day, but pay well for Chinese labor at half that price. No one knows the number of Chinese at work along the Yuba and its tributaries, but it must be large—as must be the quantity of gold extracted and sent away to China. They certainly keep the material in the river bed stirred up, and so aid it in passing on down for the benefit of their friends, the anti-miners of Marysville.

SHASTA MINES.—Much interest is taken in the Shasta county gold mines, and all items relating to that section are eagerly read. The MINING AND SCIENTIFIC PRESS has had a correspondent in your county for three weeks past. His letters have elicited much favorable comment.—*Cor. Shasta Democrat*.

KEEPING COAL.—It is not generally known that coal is less valuable for having long remained in store perfectly dry. Most coal mines are saturated with water, and if the water is drained off the coal becomes flinty and valueless. Coal stored through the summer should be sprinkled and kept moist.

THE Canadian Government has issued a proclamation establishing quarantine against vessels from Mediterranean ports, as well as from London, England, Victoria, B. C., and Sydney, Nova Scotia, are created quarantine stations.

USEFUL INFORMATION.

The Future of the Wine Industry of California.

When the wine trade of California shall become fully developed, the production of wine will be enormous. At the present time there are not far from 170,000 acres planted in vines, divided into about 4,000 vineyards, which are owned by nearly as many individuals. The productive area is given at about 46,000 acres, which, at 400 gallons of wine to the acre, say 100 gallons of wine to a ton of grapes, gives a total product of 18,000,000 gallons for the State. It is thought the product this year will reach fully 20,000,000 gallons; that the increase in 1886 will have reached 25,000,000 gallons, and in 1887, 35,000,000 gallons will be produced.

An exchange says: The value of the wine now produced in California varies widely. Ordinary wine produced from common varieties of the grape sells as low as 20 cents a gallon, the buyer furnishing the barrels; but choice wine from carefully selected varieties and fine Riesling commands from 40 cents to 50 cents. As a rule, a judicious buyer with cash in hand can pick up excellent wine from choice French grapes at from 35 cents to 40 cents. Three-year-old Zinfandel is worth about what the holder asks; it is equal to good Beaune. A dollar a gallon is not at all out of the way for a very fine wine. The wine experts figure that California received last year for her crop \$4,643,750 (includes wines and brandies), and has besides a considerable stock on hand. The industry now gives employment to about 20,000 people, with their families. The shipments of wine to the East during 1884 were about 3,500,000 gallons.

When the entire present plant of 170,000 acres of vines comes into full-bearing the yield at 400 gallons per acre will amount to an annual product of 68,000,000 gallons. With that yield our annual receipts for wine and brandy ought to reach fully \$23,000,000.

Even that figure is but a mere moiety of the product of one single country in Europe—France. The official returns of the vintage in France for 1884 show the total yield was 918,310,000 gallons, being 33,180,000 gallons less than in 1883, but an increase of 105,608,000 gallons over the yield of 1882. During the year 1884 more than 60,000,000 gallons of wine were made from raisins and from the lees of grapes after they had been pressed.

In order to reach one-half of the present product of France the area of the vineyards of California will have to be increased to nearly seven times their present extent.

When we come to look the possibilities, or even the probabilities, of the growth of this business in California fairly in the face, there is no apparent reason to fear that we are overdoing, or, in fact, can overdo it. There is no reason why within the next half century California with all her advantages may not be able to produce and sell in her own and the markets of the world fully as much wine as is now produced in France. The possibilities of the business in this State are enormous. It feeds and clothes over 1,000,000 of people in France. It will eventually support that number in California.

Polishing Wood with Charcoal.

This method of polishing wood is described in a Paris journal. All of the world now knows those articles of furniture of a beautiful dead of black color, with sharp, clear cut edges, and a smooth surface, the wood of which seems to have the density of ebony. Viewing them side by side with furniture rendered black by paint and varnish, the difference is so sensible that the considerable margin of price separating the two kinds explains itself. The operations are much longer and much more minute in this mode of charcoal polishing, which respects every detail of carving, while paint and varnish would clog up the holes, and widen the ridges. In the first process, they employ only carefully selected woods, of a close and compact grain; they cover them with a coat of camphor dissolved in water, and almost immediately afterward with another coat, composed chiefly of sulphate of iron and nutgall. The two compositions, in blending, penetrate the wood, and give it an indelible tinge, and at the same time render it impervious to the attacks of insects.

When these two coats are sufficiently dry, then rub the surface of the wood at first with a very hard brush of couch grass (*chienden*), and then with charcoal of substances as light and friable as possible, because if a single hard grain remains in the charcoal this alone would scratch the surface, which they wish, on the contrary, to render perfectly smooth. The flat parts are rubbed with natural stick charcoal; the indented portions and crevices with charcoal powder. Alternately with the charcoal, the workman also rubs his piece of furniture with flannel soaked in linseed oil and turpentine. These pouncings, repeated several times, cause the charcoal powder and the oil to penetrate into the wood, giving the articles of furniture a beautiful color, and also a perfect polish which has none of the flaws of ordinary varnish.

ORIGIN OF CRAZY QUILTS.—"Crazy" patchwork originated in the following manner: A certain titled lady while learning embroidery

in an English seminary lost her mind, and it became necessary to confine her in a private madhouse. But she still retained her passion for needlework and spent most of her time in mending pieces of material furnished her from the madhouse scrap-bag. Although unable to perform the difficult stitches of embroidery work, it was noticed that in joining the odds and ends of material given her she invariably used contrasting or assimilating colors of thread or silk and that nearly every stitch was different from the others. Specimens of her work found their way outside of the asylum and since then millions of women, apparently sane, have found delight in imitating the handwork of the crazy countess.

VENEERING.—A correspondent of the *London Cabinet Maker*, writing on this subject, speaks as follows regarding the veneering of large panels, etc.: A great many engaged at the bench are aware of the irritating difficulties of preventing the veneered side going hollow as the glue sets, in fact, many tedious methods have been devised to avert it, such as joining onds in several places, veneering on both sides, the one to counteract the other, and fixing round, before and after veneering. The method I have strictly observed for over 20 years has two great advantages of being simple and inexpensive regarding material and time. In the preparation of the surface for veneering, many workmen damp or swell the heart side of the board, and the side on which the veneer is to be placed. This I consider radically wrong; the very reverse is the correct mode. Let any one try the experiment on, say a wardrobe end made of pine, and 6 feet by 1 foot 9 inches. After preparing the heart side for veneering, swell the other side by placing a layer of damp sawdust on it over night; it will in the morning be about three-quarters of an inch hollow on the face side; then size the face side, keeping the hack damp until the size is sufficiently dry for the cold, and it will be observed on coming from the cold, to be round on the face of the veneered side, and may be kept nearly so by placing the veneered side against a flat board, or the two veneered sides face to face, to dry gradually. Of course, after trying this experiment it will be necessary to know how long the article will require swelling. Considering the pine fairly seasoned and the veneer well dry, one night as a rule is sufficient.

FURNITURE POLISH.—The subjoined simple preparation is said to be desirable for cleaning and polishing old furniture. Over a moderate fire put a perfectly clean vessel. Into this drop two ounces of white or yellow wax. When melted, add four ounces of pure turpentine, then stir until cool, when it is ready for use. The mixture brings out the original color of the wood, adding a luster equal to that of varnish.

COMBINATION FURNITURE.—Combinations which economize space still continue to attract much attention, and are being rapidly multiplied by manufacturers of chamber work for hotels, boarding and rooming houses. Many of the designs have much merit for originality, and are welcomed by many a household.

GOOD HEALTH.

How Alcohol Intoxicates.

Those of us who are accustomed to strong drink have often noticed how quickly a glass of wine or a small amount of distilled liquor "goes to the head."

Most of us know that this effect is caused by the direct presence of alcohol in the blood, but it is not generally known just how it gets there.

To explain the delicate but simple operation of conveying the alcohol into the whole system is the object of this article.

All liquors, wine and beer, are merely alcohol, diluted with water and flavored by the juices of the fruit or grain from which the drink is made. The beverage, being taken into the stomach, comes in contact with the lining of that organ.

Now, this lining is provided with a network of delicate blood vessels, which are very small and have a thin membranous covering. Alcohol has the property of permeating this coating and being taken up at once by the blood within the capillaries, which carries it away to other parts of the system. Water, however, requires a much longer time to be absorbed, and as the alcohol becomes partially removed from the contents of the stomach, they pass into the small intestines. A small percentage of the alcohol which remains after this takes place, is rapidly taken up by the lacteals or the absorbent vessels of the small intestine and enters the main blood stream by way of the thoracic duct. The alcohol all eventually goes to the heart and thence through the liver into the general circulation.

All the organs in which blood circulates are now brought into contact with the mixture of blood and alcohol.

The nerve pulp, the brain substances and the great nerve centers are rich in blood vessels, and being the most sensitive part of the body to the action of alcohol, by reason of the fact that the natural moisture of the nerves, on which they largely depend for healthy action is largely taken up by the alcohol and conveyed

to the blood, they soon lose their control of the muscles, both voluntary and involuntary.

The heart, as a consequence, beats more rapidly, having less resistance to meet. The muscles of the veins and arteries relax, and the capillaries expand.

A feeling of warmth and flushing of the face is the result. The brain acts more quickly and thought and speech flow more freely.

Upon taking a still greater quantity of alcohol, some of the functions which are governed by the spinal cord become completely uncontrolled. The legs, feet and lips are first to feel this effect.

As more and more alcohol is taken, its effect progresses from one nerve to another, until the brain itself is stupefied and the mind is totally under the deadly influence, while the man sinks to the lowest level of mere animal existence. Finally, real temporary paralysis of all the nerve centers sets in, consciousness is lost, and the victim sinks into sleep. The beating of the heart and the moving of the lungs, is all that distinguishes him from the clay from which he came—sense, reason, mind, all gone. What can be lower or more degraded?

In connection with the above which we clip from Hall's *Journal of Health*, we give from the *Medical Age* the following on

The Effect of Alcohol on the Arteries.

Dr. Loomis, of New York, on presenting a case of aneurism to his class made the following pointed statement touching the causative relation of alcohol to this accident: "A man can take two or three glasses of stimulants through the day as he may feel the inclination, and he may continue this habit for perhaps twenty years without any evident harm accruing from it; but, when this man reaches that period of life when the vital powers are on the decline, he suddenly feels himself old before his time, for he has all these years been laying the foundation of a chronic endoarteritis. I believe, gentlemen, that 50 per cent of all these diseases arise from the use of alcoholic stimulants. The more I see of disease, the more I am convinced that, as a rule, a man is young just in proportion as his arteries are healthy and old as they are diseased."

FOOD FOR THE NERVOUS PERSON.—A distinguished physician says that he is disposed to exclude vegetables, with the exception of cereals and a little fruit, entirely from the dietary of nervous persons. Animal food is more nutritious to the nervous system and to the body generally than a vegetable diet. It has all the elements for the formation of the tissues of the body, and is easily digested. Men can exist on it in any climate. Of meats, beef is by far the best. Pork is good for nervous persons, but is not easily digested. Wild game is excellent. Fish is good food for nervous people. Eggs boiled just enough to harden the white are easily digested. It is a mistake about people eating too much. The majority do not eat enough. Nervous dyspepsia comes from working too hard and not eating enough. When a man begins to suffer from overwork he should eat plenty of good bread and butter, drink two quarts of milk a day, and eat plenty of good meat. When such a person resorts to a vegetable diet, he grows weaker and loses his nerve power. Man was made to eat meat, and he never will flourish on a vegetable diet.

HOW SHALL THE PHYSICIAN CLEANSE HIS HANDS?—Dr. Forster, of Amsterdam, contributes an article on this subject to the *Centralblatt für Klinische Medizin*. He calls attention to the great importance of physicians thoroughly disinfecting their hands before leaving a case of infectious disease (especially any of the exanthemata), and at the same time he asserts that few of the disinfectants now in use really have the power of destroying those microspores which are recognized as so dangerous an element in modern medicine. After a series of careful experiments in the hygienic institute at Amsterdam, in which every precaution was taken to avoid error, the author decided that a solution of carbolic acid of the strength of two and a half per cent was not capable of "sterilizing" the finger, but that a solution of corrosive sublimate of the strength of one or two thousand formed a reliable antiseptic wash. He urges that the latter be adopted by all physicians as well as surgeons.—*N. Y. Med. Jour.*

EPITHELIOMA.—General Grant's disease is termed epithelioma or true cancer. It is a tumor caused by the morbid growth of epithelial tissue. This is the tissue that covers or lines all cavities of the body with an external opening, no matter how small. The mouth and throat are examples, and the covering or lining of these parts is an epithelial tissue. It may be caused by long continued irritation of the part, such as would be caused by smoking, drinking, or the use of highly spiced articles of food. An epithelioma is one of the various forms of cancer, and is more or less malignant. Were General Grant's tumor on the external covering of the body it could be removed with safety.

GOOD NEWS FOR HUNGRY FOLK.—A physician says that wakefulness is oftentimes merely a symptom of hunger. Gratify the desire, and sleep ensues. The feeble will be stronger if they eat on going to bed. Some persons are exhausted merely by the process of making their toilet in the morning. A cup of warm milk and toast on retiring, or of beef tea on awakening, will correct it.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

MISCELLANEOUS.—Amador Ledger, July 4: The taking out of the water from the Moore shaft was completed early this week. The mine is free from water to the lower level, 160 feet from the surface. The shaft is found to be in excellent preservation to this point. Below, however, the shaft is in poor condition, and will have to be extensively repaired and retimbered before any sinking can be done. A prospect tunnel is being run in a northerly direction at the 180-foot level. At the Gover, everything is in good working order again, and the mill will be started in a few days. All indications point to the return of prosperous days for this mine. A fine body of ore has been struck on the footwall, which, according to all reports, justifies the sanguine expectations of the stockholders. The crushing of 900 tons of ore from the Median mine realized at the rate of \$8 per ton in free gold—a very satisfactory result. Having proved the paying quality of the rock by mill test, the company intend to put up steam hoisting works, and proceed to put the mine in good working order. Notices are posted calling for proposals for running a cross-cut at the 700-foot level of the South Spring Hill, at Amador City, the cross-cut to be 100 feet long, 4x6 wide and 8 feet high. A splendid ledge, 15 feet wide, was struck in the Moore mine Wednesday.

SUTTER CREEK.—The sale of the Mahoney is still an undecided question. Everybody is anxiously waiting to hear of something definite in regard to the property. The water is being kept out. S. D. R. Stewart, who is operating on the south extension of the Lincoln, is pressing the work energetically. About 50 feet more remains to be sunk, and then drifting will be commenced. Existence of a body of good ore is known, and for this locality the present work is being directed. The mill will be started next week on surface rock to help pay expenses while sinking is being prosecuted.

Calaveras.

STICKLE MINE.—Mountain Echo, July 4: In the Stickle mine, owned by F. K. Bechtel, a three-compartment shaft is down to a depth of 400 feet. At present ore is being extracted from the 200-foot level, the breast being from 14 to 20 feet wide and all good milling ore. The water is being pumped out of the lower levels, where a large body of high grade ore lies, and as soon as this is done work will be resumed on those levels. There is a 10-stamp mill running constantly, which will soon be increased to 20 stamps, when about 50 tons of ore will be milled daily. The hoisting works and mill are both run by steam power, and about 20 men are employed about the works. The Utica mine, a double compartment shaft, is down to a depth of 150 feet, on which level two drifts, one north and the other south, are being run. The north drift is 85 feet long and the south drift 35 feet; the ledge is from 15 to 25 feet wide and all good milling ore. A 20-stamp mill, run by water power, is crushing about 30 tons per day, and 30 men are employed by this company. The Lindsay & Co. mine is down to a depth of 120 feet, and the prospects are good. Three men are engaged in running a drift on the 110-foot level to cut the vein. The drift is in 115 feet, and the formation is of black slate. The Northend mine, Smith & Co. proprietors, is down to a depth of 85 feet. The ore lies in contact veins about four feet wide, all good milling ore. A 5-stamp mill is now running on the ore, crushing about 10 tons daily. The ore is hoisted by a whim and the mill is run by water power. The water in the mine is easily handled, and but six men are on the pay roll. The Potter mine, recently purchased by J. V. Coleman & Co., is now doing considerable work. Two new hoisting works with substantial machinery are being erected on two of the old shafts. It is the intention of this company to develop the mine to such an extent that a large mill may be kept constantly running. The Reserve mine is sufficiently developed to keep a 40-stamp mill running constantly. Full particulars could not be learned. Some very rich strikes have been made in pocket mining in this vicinity, and the prospectors are encouraged. Numerous arastras are running on prospect rock and doing well. All the above mines which have mills running are producing profitable results, and work is encouraged in them.

MORE RICH ROCK.—Calaveras Chronicle, July 4: The Tiger mine at Rich Gulch continues to produce very rich rock. Mr. C. Schlund, the lucky owner, showed us some specimen of ore one day this week. The specimens of quartz were "lousy" with gold and abounded in sulphurets. The quartz is what is called "ribbon rock." At the depth of one hundred feet a level was started, which is now in some fifteen feet, revealing a vein of ore fully six feet in width of the character of rock mentioned. There are now about 30 tons of rock on the dump. There is a 10-stamp steam-power mill on the mine, and when a good quantity of rock shall have been taken out, Mr. Schlund states that he will then start up the mill and crush the rock. He is in no hurry, however, to start the mill, but his main object is to explore the vein well before going into any more extensive operations. If it continues as it is now developing it is going to prove a veritable bonanza.

El Dorado.

WILD GOOSE FLAT.—Georgetown Gazette, July 3: Mr. J. Zentgraf is associated with his father Mr. Antoine Zentgraf, in working a quartz mine at Wild Goose flat which promises in the near future to become one of the permanent paying mines of our county. The ledge is from two to four feet in thickness and is being worked through a tunnel 800 feet in length. They have 250 feet of "backs," the ore is of good quality and has paid for all expenses incurred up to the present time. The work of development has been prosecuted judiciously and economically. At present but five stamps are in operation, but there is sufficient quartz for a much larger mill, and the Messrs. Zentgraf have concluded to add another battery of five stamps before the close of the present year.

Inyo.

BENTON.—Cor. Inyo Register, July 3: In early days, about '63 and '64, I believe, some very rich rock was found in Montgomery Canyon, and a tremendous

rush and excitement was the consequence. A lively little town of 3 or 4 thousand inhabitants at once sprung up, locations were made and mines opened out, and large shipments of rich ore made to San Francisco and other places. I have been told that some of the ore was worth from \$2 to \$3 a lb.; but the ledges were broken on the surface, and apparently gave out, and the excitement soon subsided. In the meantime, parties prospecting around found rich ore on Blind Springs Hill, and every one rushed for the new discoveries, and soon Montgomery had nothing left but the few who went on working their mines. On Blind Springs Hill the Diana was discovered, the ore cropping out on the surface like the back of a whale. And this was for a long time one of the best mines on the hill. Then we had the Comanche with a chimney of ore sometimes 6 feet in thickness and worked down for 800 feet. The Cornucopia paid well for a while, and is still owned and held by the Cornucopia Co., of Philadelphia. The Laura & Eureka have been steady bullion producers since they were discovered. The Lyford & Rockingham, from one chimney of ore, netted Albert Mack over \$60,000. The Elmira, a small vein west of the Comanche, discovered and located by Jas. Shaw, J. O. Wheeler and J. A. Lyford, produced \$25,000 from one small piece of ground, after it had passed into the hands of the Comanche Co., and very little work was done on it since. Besides these there are 30 or 40 other claims of more or less account, but all needing development to show their value. Many of these have been abandoned and relocated time and again, parties sometimes making a strike, others not; perhaps one locator would do work for a year or two on a claim, then give it up, another party would come in and perhaps in a day or two's work strike a pocket or chimney that would produce enough to pay for all the dead work that had been done. Many mining camps on the coast have given out, their mines failing to produce after spending on them millions of money; but Benton though sometimes experiencing a dull spell like what it is at present, has always been a strictly bullion producer since the first discovery, and it will continue to do so, for the veins are here; the ground is only scratched; the great mass of the ledges contain more ore than was ever taken out. Dan Cathey came over to the Sierras a couple of weeks ago to continue work on a ledge in Montgomery Canyon on which he has been working for two or three years. He has tunneled in now over 600 feet, and proposes to go through the mountain or find the ledge. Several other parties are prospecting in that vicinity, and we may look for something lively this summer.

BROWN MONSTER.—Inyo Independent, July 4: A lease of the Brown Monster was granted this week to Tom Bastion, W. Bastion and their brother-in-law Wilmot. Tom Bastion moved his family from Lone Pine to the mine a few days ago. The parties who had the mine leased prior to the granting of the present lease, earned about \$70 per month; but not content with this they threw up the mine, and wandered off to Montana, Idaho, or other distant places in search of "a big thing." It is curious how inveterate this wandering habit is with miners, they are always hunting shadows, seeking the gold buried at the end of the rainbow, but the disease appears to be as incurable as cancer. Miners who stick to the Inyo range, and are industrious, earn good wages.

VANISHED.—The prospective greatness of Antelope Valley, Mono county, has vanished like the baseless fabric of a vision and has left, not a wreck, but many wrecks behind. Specimens of the mineral were most thoroughly tested by State mineralogist Hanks, and by him pronounced to be worthless. Everybody in Inyo county would have rejoiced heartily if the wildest hopes of the Antelope valley prospectors had been more than realized. A much better field for prospecting, and an assurance of at least a good living, can be found by these prospectors in the Inyo mountains, and they will be welcome here if they come with intent of honest work. Hilario Arambula, Miguel Escobar and one more man, got fifteen hundred dollars' worth of gold from the last run of their ore from the Chilula mine. The men worked just sixteen and a half days getting out the ore. Last Monday the three started in again getting out ore for another run, and they are certain of doing even better on this than the former run. The ledge in the Chilula is three feet wide, all of the ore is worked, and averaged forty dollars per ton. Parties who have recently been to the White Hill district give very favorable reports of the mine belonging to Welch and Downs. The ledge where recently opened is strong five feet wide for a distance of 50 feet. Samples of the ore brought to Independence are evidently rich in silver. This is the largest ore body yet found in the White Hill district, and the mine gives better promise with every day's work of turning out a valuable property.

Nevada.

TO RESUME WORK.—The Virginia City Enterprise, July 4: J. P. Wheeler, one of the oldest and best known mill and mining men of the Constock, leaves to-morrow morning for the Centennial gravel gold mine in Washington township, about 14 miles this side of Nevada City. He goes under the direction of the trustees of the company, and will at once proceed to put the engine and hoisting machinery in order to resume work in the shaft. The proposition is to pump out the water and sink into the gravel channel struck when operations were suspended for the winter. It is thought that this shaft is located right to strike directly down into the very heart of the great blue gravel lead or channel from which so many millions in pure gold dust have been taken, and the strong influx of water with the gravel struck after passing through the lava indicates this. When properly commenced the work will be actively prosecuted.

PRODUCING PROPERTIES.—Eureka Sentinel, June 29: The mining situation in Eureka district remains substantially the same as last week. In one or two properties on Prospect Mountain new developments have been made, but as yet they have not been prosecuted to any great extent, and consequently their values are not ascertained. During the past week from mines there, the following shipments have been made to the Richmond reduction works: Whippoorwill, 22 tons; Lunderberg, 11; Home Tippet, 6; Lord Byron, 9; Eldorado, 14; Silver Connor, 8; Maria, 8. To the Eureka Con. furnace Maurice Hartnett made a shipment of two tons from the Plute mine. On Adams Hill the situation continues interesting. At the Wilde West mine, which is leased by Messrs. Frazer & Malino, over 300 sacks

of ore are on the dump ready for shipment. From the Lone Pine, which is being worked by Messrs. Quinn and Berry, some ore which will work over \$300 to the ton, is being extracted. The following shipments were made during the week from properties of that section to the Richmond works: Silver Lick, 71 tons; Bowman, 42; Wide West, 2; Reserve, 1; Marguerite, 11. The mines on Ruby Hill continue to produce ore as usual. The Williams' pitch on the seventh level of the Eureka Con. mine is looking as well as ever. From this body alone over 350 tons of ore have been extracted during the past few weeks, and as yet there are no evidences of its proving less in any way than was predicted by the company when first encountered some two months ago. In fact, it is proving larger than anticipated over a fortnight ago, and its general character is holding out fully up to the expectations of all the interested ones watching the work as it progresses. The other pitches of the property are said to be looking and holding out well. Ore from the mine is being shipped to the company's works as it is required there. Not knowing what work is being done in the Richmond mine, we are unable to make any report of it. The Albion mine shipped during the week to the Eureka Con. furnace 11 tons of ore, and the Phoenix 7. From Revelle district, over in Nye county, G. E. Clark brought in to the Eureka Con. furnace during the past few days 8½ tons of high grade ore, and from some properties in Tybo 4 tons were brought in to the Eureka Con. furnace. Several small shipments of ore were also made from properties in and near Hamilton to the furnaces here.

Plumas.

NOTES.—Greenville Bulletin, July 4: T. F. Enmons is running the Kettle mill on ore from the Altoona mine. Work on the Gold Stripe continues. The rock in the tunnel is very hard, making the progress rather slow. Things progress at the Green mountain with the usual regularity and smoothness. Good advancement is being made at the Indian valley. The Forest King is looking well and doing well. The Arcadia mill is running regularly on some fine ore from this mine.

San Bernardino.

CALICO DISTRICT.—Print, June 28: Notwithstanding the cry of dull times, mining at no time in Calico district has been in a more prosperous condition than at present, or the outlook of the mining interest brighter. It is not saying too much to assert that the camp is by far the most extensive and richest silver belt discovered upon the coast. As yet no great developments have been made, the greatest depth attained upon any one mine being that of the King upon which a depth of 600 feet has been reached, without any sign of a failure upon the part of the vein, or a giving out of the ore, but enough developments and explorations have been made to satisfy and convince the most incredulous that the mines of Calico are true veins, and carrying immense deposits of chlorides and horn silver, the ores being with scarce an exception free milling, requiring no roasting, but the simplest of chemicals. The ores are worked up to as high as 90 and 95 per cent. Among the different mines visited during the last week is the Paw Paw, owned by Harry Erckenbach, Cahill and Wentz. This mine is located about 200 feet east of south of the King, and one-half mile from the town of Calico. A tunnel has been run in and along the vein a distance of nearly 400 feet, showing a well defined footwall and a vein of high grade ore of two feet in thickness, and gradually widening as depth is attained in the tunnel by running in the hill. Several tons of ore of a most excellent quality are now on the dump. The owners are men of limited means, hence the developments are naturally slow enough.

THREE ANGELS.—This mine is located on the new wagon road leading to the Blackfoot mine, and is owned solely by Thomas Wiltier. There is a magnificent showing, a splendid milling proposition with plenty of high grade ore, carrying horn silver and chloride. Alone and unaided the owner works his mine. Of course the developments made must naturally enough be slow. Wiltier being without capital can do little else than surface work.

BLACKFOOT.—This mine is under lease and bond to the Calico Mining and Reduction Co., and likewise located in East Calico and north of the San Houston No. 1. Some 20 men are employed at and around the mine, which is yielding ore in large quantities of first-class milling grade, which will be reduced at the company's new mill in Daggett. A new wagon road has lately been constructed to the mine, and several hundred tons of ore are already on the dumps awaiting transportation. The Hap Hazard is likewise under lease and bond to the same company, and is located about half way between the town of Calico and Cuba mine, being worked by a small force of men under the foremanship of Wm. Cochran, with gratifying success, as the ore is of a fair grade, with a fine showing and like all ores of this camp, is free milling. The Dora Belle is located in the vicinity of the Bismarck, owned by J. B. Whitfield and others, is under lease to Page & Co., who are good miners, and have recently made in the lower levels of the mine an important development. This mine has a shaft down 50 feet, and levels run, in one of which the recent rich strike was made, the vein shows well. The ore is a soft, reddish spar, yielding horn silver and chloride, and will mill well up in the hundreds.

WATERLOO.—This mine lies in a westerly course from Calico, and distant about one and a half miles. It was not long since purchased by the Oro Grande Mining Co., by D. Bahten, superintendent from Garrett and McDermott. Since coming into the possession of the company two shafts have been sunk upon the vein, 400 feet apart, each in ore of an excellent milling quality. From shaft No. 1 a cross-cut has been run 40 feet, exposing one of the largest ore bodies in this camp. The company are preparing to build boarding houses, whim, etc. The Mountain Brow is being worked under lease by supervisor T. H. Eckles and his partner Mr. Woolman. This mine lies parallel with the Josephine, and was in 1883 and the early part of 1884, worked by A. K. Sparkuhle and has yielded tons of as rich ore as ever were extracted from the district. The present lessees are doing well, and meeting with undoubted success. The location is within the zone of the King belt and north of and adjoining the Red Jacket. Much ore of a good grade is being extracted and milled. Exchequer lies north of and adjoining the Occidental, is owned by the Brison Bros. and Mr. Reed. Here we find one of the finest surface

showings in the districts. The ore outcrop is to be seen in many places on the surface and is of a high grade. A tunnel is now being driven in by the owners from the north hill side to tap the main ore chimney. Captain Brison is diligently engaged in the prosecution of the work. Jupiter lies north of and adjoining the Exchequer. This location is owned by J. W. Coleman & Co., who have been for some months steadily engaged in opening up and developing the resources of the same. The ores are similar to those of the Exchequer, and of about the same grade. The owners at this writing have made a shipment of several tons, after the working of which the design now is to sink a working shaft and open up the mine in a workmanlike manner.

SAM HOUSTON No. 1.—This mine lies in that part of the district denominated East Calico, and owned by Los Angeles parties, now worked under lease to Benefield, Whitton and West Nichols. The ores are of a high grade, and the lessees are undoubtedly doing well. The mine has every indication of being a fissure, as it carries a well defined foot wall and is upon a direct line and north of the Plutarch, which is owned by John McBride & Co., and upon which some 6 or 7 tributaries are now at work, among the number being George Clark and Gus McIlvain who have a lease of a portion of the ground and are now taking out ore which will mill upwards of \$500 per ton. The Plutarch is north of and upon the same vein or ore channel as the Taggart, which is owned by J. W. Taggart, F. M. Neel and others.

CUBA.—This mine was last year purchased by Gov. Daggett's Co. from Keyes and McGlinchey, and is now being worked most successfully by different parties, under tribute, who give one-fourth of the net proceeds, after deducting expenses of hauling and milling, which by the way, is the usual royalty exacted and paid by tributaries in Calico. Paradise Springs lie about 12 miles north and east of the town of Calico. Here there is an abundance of water, the springs affording something like 20 inches. The country rock is granite. The principal mine so far opened up is the Vulture No. 1, owned by A. M. Rae & Co. Upon this vein a shaft has been sunk twenty-five or thirty feet. The vein is encased between two well defined walls, is four feet in thickness, all pay ore, carrying free gold, with little or no silver. The mine is located one mile or thereabouts from the Springs. Work is being vigorously prosecuted on this vein by the owners, as they are now sinking a main working shaft with a view to a complete development of this property.

Trinity.

FROM NEW RIVER.—Trinity Journal, July 4: Mr. Murchie, late superintendent of the Mary Blane mine in New River district, passed through Weaver ville this week on his return to his home in Nevada City. The mine has been closed down, owing to the company failing to pay its laborers. Mr. Murchie complains bitterly, and with apparent good cause, of the shameful treatment of himself and other employees by the Mary Blane Co. It is to be hoped that matters will assume a better form ere long, and we are disposed to believe they will, as the company is composed of some of Eureka's best citizens, who can ill afford to rest under an accusation of refusing or neglecting to pay for work done for them.

POCKET MINING.—G. W. Ward showed us about an ounce and a half of gold this week which Mr. Riffe, himself and others had taken from a "pocket" on the ridge between West Weaver creek and Democrat gulch. The finding of this pocket demonstrates that such do exist in this section, and will doubtless stimulate others to searching in the same direction, thus encouraging a method of mining which has proven vastly remunerative in other sections.

Tuolumne.

SHUT DOWN.—Union Democrat, July 4: The Hyde mine has shut down again. Whether the parties who have the property bonded will resume operations or not is an open question. They started out with a disagreement among themselves, and matters have not since shaped themselves harmoniously, an unfortunate thing for the mine, which is likely to suffer in reputation from purely outside circumstances.

MILL RUNNING.—The Lamphier mill started up last Monday and is running steadily. It is likely to be a long time before it will be permanently closed down again. A small force is operating on the Green mine, and some very fine rock is being extracted. We understand that the mill will be started up next week. The Rising Sun mine was sold by the sheriff last Saturday to satisfy a judgment. F. D. Nicol, E. A. Rodgers and F. W. Street, attorneys for the lien holders, bid in the property at \$2,107.67. Edward Fisher, of San Francisco, has bonded the Fitzgerald mine at Quartz Mountain from the Fitzgerald brothers, and will proceed to open up the mine. The price named in the bond is \$9,000. County Clerk Fitzgerald is one of the owners of the mine. Fifty tons of quartz was recently taken from the croppings of the Riverside mine and worked for the purpose of making a test. We have not learned how the rock turned out. One hundred tons more of the croppings will be worked so as to make the test conclusive. Should the yield prove satisfactory, a shaft will immediately be sunk on the croppings. If not, work will be resumed in the tunnel, which is now in over 400 feet.

NEVADA.

Columbus District.

MOUNT DIABLO.—Candelaria True Fissure, July 4: The north crosscut on the sixth level is now in 32 feet and shows barren ground. The east drift on the sixth level is in 100 feet, and the east drift on the fifth level is in 168 feet. The intermediate between the fifth and sixth levels shows a few inches of \$70 ore. The stope between the fourth and fifth levels and west of the incline are looking well, and turning out considerable \$70 ore. The intermediate below the fourth level, near vein No. 2, shows two feet of \$50 ore. The west drift on the third level is giving a small amount of ore of good grade. The stope, near vein No. 5, and below the third level, shows a good bunch of \$60 ore. A little ore of good grade is being taken from the intermediate between the second and third levels and east of the shaft. The intermediate between the second and third levels and west of the shaft, shows a little improvement. The west drift on the second level is turning

out considerable ore of fair grade. The workings above the second level show no marked change.

Jefferson District.

GOOD ORE.—Belmont *Courier*, July 3: Henry Harrison informs us that the Harrison mine at Jefferson is looking well, and that good ore is being extracted. The little mill is running constantly and producing fine bullion.

Reveille District.

WORK.—Belmont *Courier*, July 3: Work in some of the mines of Reveille district is being pushed energetically ahead by George E. Clark, the Norris Bros., Joe Bianchi and others. Good ore is being extracted and shipped to Eureka for reduction. The ore from the mines of this district is of a high grade.

Star District.

SHEBA.—Silver *State*, July 3: The Sheba mine at Star is now owned by Peter Woolcock, of Mill City, who has leased it to William Woolcock, Joseph Phillips and Thomas Bray, all practical miners. The lessees are at work in the mine, and taking out some very rich ore. They expect to ship a carload shortly that will average \$600 to the ton. Old miners are of the opinion that the Sheba is one of the best mines in the country.

ARIZONA.

OUR GRAVEL BEDS.—Prescott *Courier*: These are the most certain "banks" in this country. They never fail to honor the demands of labor upon them. They exist in various places in this country; are as yet scarcely prospected and will, with proper working, be made to yield a great deal of gold. Those near Weaver and Walnut Grove are very extensive, so are those on the Upper Hassayampa, Turkey, Lynx, Big Bug and Black canyon creeks. Mr. Tracy, who owns one of these "banks" on the Hassayampa, takes some beautiful pieces out of it. His pay gravel is six feet thick and he will soon have it "faced" for a distance of 80 feet. He has wet and dry diggings and can always capture gold. The railroad, which will bring in men and means to work all our mines, will make placer mining one of the regular industries of this great country.

MOJAVE MINES.—*Miner*, July 3: John Hughes and William Davis are reported to be taking out \$800 ore from the Constellation mine near Cerbat. Capt. Layne shipped six tons of ore from the new strike on the Prosperity mine last week as a sample. He expects the ore will go over \$200 per ton. Messrs. Smith & Sherman, of the Golconda mine in Todd basin are developing a fine body of ore, and shipped another carload last week. On the Primrose mine the outlook still continues to improve, and Messrs. Maxson & Jackson are jubilant over their prospects. They shipped 12 tons of ore last week. Beecher & Co., of Kingman, have shipped during the past week twelve tons of ore from the Golconda mine, twelve tons from the Primrose, six tons from the Prosperity, and five tons from the Little Boy mine, all in the Todd basin. Messrs. James Nimon and Morrison are back again from Colorado, and have resumed work on their gold mine at the Music mountains. Their claim lies west of the ones owned by Thompson & Co. Messrs. Ridenour, Upsher and Moon shipped another carload of ore from the Hackberry North mine to Kingman last Monday. The ledge is looking better than ever. Messrs. Prisk & Pomeroy, of the Little Boy mine, at the head of Todd basin, shipped five tons of high grade ore last week. Ore from this mine will run from \$250 to \$1,500. The Music Mountain Gold Mining Company will soon start up again on the Ellen Jane mine. The company propose to sink the main shaft, now down 102 feet, another 150 feet, and the work will be commenced on an early day. Messrs. Ashbury and Lockwood left town on Monday with a load of provisions and supplies, bound for the Mocking Bird mine, at the foot of Stockton Hill, which they have leased. The Mocking Bird generally runs from \$200 to \$1,200 per ton, and there is no reason they should not get out lots of it. Capt. Layne, one of the oldest and best prospectors in the county, was in town on Monday. He brought in a box of free specimens from the Prosperity mine, in Todd basin, which show ruby and native silver in abundance. The new strike on this mine is high grade, 18 inches wide, and, if it holds out, Messrs. Layne and Wright have a fortune in it. All over the length and breadth of our county miners are doing better than ever before. Instead of our rich ores being worked out by former chloriders, it would appear as if they were only just being unearthed. The mining outlook of Mojave county has never been better than at present.

COLORADO.

CRESTED BUTTE.—Elk Mt. *Pilot*, June 2: There is enough ore passing through our town to run a smelter. Crested Butte will be shipping 50 tons of ore a day before snow flies, and still none of our capitalists will venture to erect a smelting plant here. With positively everything that is needed to make success certain, they shake their heads ominously, then go off where they can secure none of the requisites to success, invest, and—make a failure of it. Then they call us liars and thieves, and all because they could not tell the difference between good advice and bad advice. The Sylvanite Co. are putting in to the Avery smelter works chlorination process. The company will expand several thousand dollars and put the work in first class shape. They have purchased a Bruckner roaster which is now in transit, one piece of which weighs four and a half tons. Prof. Moritz, of Swansea, England, is in charge of the works. There are about 50 men at work in the Poverty gulch and Dark Canyon districts, nearly all of them taking out ore. The Florida lode, in Poverty gulch, is destined to be a producing mine ere long. It is located in the vicinity of the Augusta and Richmond, and is owned by H. V. Meloy, M. J. Gray, et al. At present Scott McCulloch has a contract to drive a cross-cut tunnel, and sink a shaft on the vein to connect with the tunnel. From present indications it will emerge from a prospect to a producing mine by fall. The ore is characteristic of that found in the Augusta and is increasing in quantity as work progresses.

IDAHO SPRINGS.—*Gazette*, July 2: Shipments of ore were made from Ute Creek this week, Mayor Griswold, who is working the Inman lode, Chicago

Creek, has one of the biggest and best lodes ever struck in that district. The ore at a depth of only sixty feet shows several inches of solid mineral, which shows ruby and brittle silver in profusion. A large amount of ore is being taken out and sorted, and a shipment will be made some time this month, which will astonish our mining men. Since our last article on the Freeland mine all the levels below the Freeland level have been extended several hundred feet; raises from one level to the other, for the better circulation of air, have been made, and all show ore of good grade, some of which runs several hundred dollars to the ton in gold. The concentrating works and smelting works are running steadily and turning out the usual quantity of bullion, which is making a net profit on the property of from \$10,000 to \$12,000 each month. The experiments which will be made with the Osbiston smelter, on Clear Creek, in smelting with coal, if found satisfactory, the whole Freeland smelter will be moved down on the line of the railroad, as wood is getting scarce, and coal will undoubtedly have to be used. The ore can be hauled down to the smelter for one-third of what coal could be hauled up for. The outlook of this great mine is certainly bright. In answer to the Financial and Mining Record, of New York, which desires us to enumerate the number of stamps in operation around Idaho Springs, we give the following: The Lilly Consolidated Mining and Milling Co., 25 stamps; the Barber Gold Leaf Mill, Soda Creek, 10 stamps; the Bully Pan Mill, Squirrel Gulch, equal to 10 stamps; Tarr & Co., Chicago Creek, 10 stamps; Mott Mill, 10 stamps; Osbiston Mill, 10 stamps; Champion and Donaldson, 50 stamps; Osborne & Co., Fall River, 10 stamps. Total, 135 stamps. This is a large number of stamps, considering the small number of gold mines in operation. The capacity of the concentrating works is about thirty tons a day. The sampling works treat and buy on an average of thirty tons a day, or from 800 to 1,000 tons a month. All these, with two smelters in operation, make this point the peer of any camp in the State. The Union Smelting and Refining Company, which has lately been organized with a capital of \$500,000, has secured control of the Campbell smelter and is remodeling it. It will start up in about a week. Mr. Ben. D. Allen, of the Public Sampling Works, is the manager, which insures its success. Mr. Allen will purchase all ores, and sample and pay the highest cash price for their contents. These works will employ about twenty-five men. About fifteen men are burning charcoal, four or five cutting wood, and a number employed hauling. Mr. Allen, who also has charge of the Gunn Tree mine, at Freeland, one of the big mines of that district, will soon have the engine and boiler in position. At present about twenty-two men are employed on the mine in doing development work, and the force will be increased as ground is opened up. This mine is capable of producing large quantities of ore, almost enough to keep the smelter going. Last month the sampling works purchased over 800 tons of ore, and this month will largely exceed that amount.

CRYSTAL CITY.—Activity has commenced in our mines and good reports keep coming in from the boys. Mines are showing up well in different parts.

MONTANA.

THE HELENA MINES.—*Inter-Mountain*, July 1: S. T. Houser, of Helena, who is now in the city, was talked with last night by an *Inter-Mountain* reporter concerning the general east side mining outlook. Mr. Houser, as is well known, is president of the Wickes Company, and is prominently interested in a number of other extensive mining properties in the Helena section. The east side mines, he says, are looking up, and more is now being done in that industry in that section than ever before. As a result Helena, which was somewhat dull for some months past, is now lively up, and that boom in the coming of which every true Helenaite has such implicit faith, seems now at hand. The Wickes mines and works are running about as usual, with the exception that a magnificent development was made a few days ago in the Alta, the ore body having been found to be 18 feet wide at the point where the 1,400-foot tunnel taps the lead, at a depth of 900 feet. This is a solid ore and is of an excellent grade. The works are producing from \$100,000 to \$120,000 per month. Work on the Bonanza Chief, the gold property in the Wickes vicinity about which there was so much excitement in Helena five years ago, has been resumed. The property had lain idle for the past three or four years, the machinery for working the ore at that time having not been of a kind suited to economy, there being a good deal of iron pyrites in much of the ore. This pyrites ore is now taken to the Wickes works where it is smelted along with the galena ores. It contains from \$50 to \$60 in gold to the ton, and this goes into the base bullion. They are also getting a good deal of free milling ore from the Bonanza Chief, and this will be treated in the works upon the property, to which some important additions are to be made. At the Legal Tender, a galena property in the same vicinity which produced a good deal of high grade ore, (some of it rich in ruby silver) two or three years ago, work has also been resumed recently with promising prospects.

OTHER MINES.—The Helena mine, one of the discoveries made this spring some four miles west of Helena, is working a small force. Levels run both ways along the vein from the bottom of a 60-foot shaft show from 18 inches to 4 feet of 40 to 50 per cent. galena ore, carrying about 60 ounces in silver. In the Ten Mile district some big sales are understood to be on the tapis, one being the Lee Mountain group, owned by John Caplice, of Butte, and others. Mr. Caplice is now in New York and it is expected that the properties mentioned will be purchased by a strong company in that city which has been negotiating with the owners for some time past. If the sale is made the 50-ton concentrator erected last fall near the Lee Mountain mine, will also doubtless go into the hands of the new company. The J. H. Russell group of mines in Ten Mile district, under bond for a large figure to C. A. Broadwater and St. Paul capitalists, and on which some 30 to 40 men have been at work for several months past, developing, will, it is expected be bought. The syndicate has already expended a good deal of money on the work, and the result has been such that they have secured an extension of the bond until January 1st, and will continue the work of developing. There is little doubt of the sale being made. There is a good

deal of other new work being done in Ten Mile district by the smaller mine owners and generally with satisfactory results. The old producing mines of the Helena vicinity, the Gregory, Glover, Drum Lummion, Homestake, and others, are keeping up their usual output.

BOULDER DISTRICT.—Cor. Helena *Independent*, July 2: One of the unmistakable "mother lodes" of the Boulder district is that upon which are the Comet, Kanawha, Australian, Bismarck, Wilbur, Virginia Belle, and Emmet locations. These are all in one direct line, and the formation is such as to justify the assertion that the lode on which they are located is the one principal fissure of that district. On the north side of that vein there is no mineral of consequence found, while on the south are numerous spurs of the character of the Von Armin putting into it. The great lode runs in a northeasterly and southwesterly direction, and these intersecting spurs run nearly east and west and not beyond the lode. The Virginia Belle, owned by B. C. Brooke and B. P. Mason, has been bonded for \$20,000, and in order to develop this claim a tunnel has been run 180 feet to the vein and a good body of galena opened. Some of the ore is reported very rich, and the average of it good. Parties who seem to be in a position to judge of the probabilities say that the mine is as good as sold. The Emmet is on the same lode and distant from the Virginia Belle only about a thousand feet, and is bonded at \$25,400, and ten men are actively engaged, night and day, in its development. The vein is about six feet wide, and shows a very good grade of galena ore, intermixed with carbonates, and the average is claimed to be about fifty ounces. The Wilbur, also on this lode, and next to the Bismarck, is bonded, together with the Herkshire, which lies parallel with it. On the Wilbur the deepest shaft is 62 feet, and at the bottom the ore is three feet and widening, and 200 feet away is another shaft 20 feet deep, in which the pay is three feet wide. From the deep shaft is a level which displays an ore body of four feet thick. The galena carries from eighty-five to ninety ounces of silver to the ton, and from \$5 to \$12.50 in gold. The Pilot is the same vicinity is also under bond, and the parties bonding are about to erect a hoist and open the mine. At present there is a vein nine feet thick, and it is claimed that the ore will concentrate to good advantage. Sam. G. Mackay is shipping ore from the old Belle of the Boulder to the Amazon works, and it is reported that returns are satisfactory. The McGregor Mining Co. has just about completed a fifty ton concentrator, similar in character to that at Corbin, and it is claimed that the company has a large quantity of concentrating ore already accumulated, and preparations are making for extracting ore from their McGregor mine. Developments in that mine have attained the depth of one hundred and eighty feet. Altogether the prospect of a busy and successful season for this district is good. The Helena Mining and Reduction Company are in good spirits over the appearance of the Alta lode in the sixth adit level, where, for the last hundred feet, the vein shows a width of 18 feet, all ore. A thousand feet of stopping ground of that character would be good enough. The Isabel lode on Nevada creek has been sold to Helena parties, and a mill is to be put up without delay. This lode carries gold only, and is very free, and there is no doubt that a good paying investment has been secured to the promoters of this enterprise. Milo Courtright has made several locations near Diamond City in Meagher county, and other parties are talking with him of making a grand consolidation of interests and putting the properties in the way of development. A mill is there which could probably be utilized in the prosecution of the work, and from examinations made, there is little doubt that if this is done another success will be inaugurated. A practical miner has been over the ground, and reports favorably as to the character of the prospects there. At one time a large amount of work was done on the quartz in the vicinity of Diamond, and high hopes were entertained of ultimate results; but when the celebrated White Pine stampede occurred, the picks of Diamond were left hanging in the air, and comparatively nothing has been done since except to work the placers, which have not yet stopped yielding. The Drum Lummion bullion produced this month will amount to about \$80,000, and that of the Helena Mining and Reduction Company will aggregate nearly as much. On the 25th of last month one of the boilers gave out, and as a consequence one of this company's furnaces has been idle about half the month, and the other has not done very effective work on account of insufficient blast, but in the meantime a large quantity of ore has been roasted, and from this time forward there will probably be no interruption, and the next month's product will doubtless be double that of June, or about \$150,000. A new boiler and engine has supplanted the old ones, and everything is ready for a long and successful run.

NEW MEXICO.

APACHE DISTRICT.—Deming *Tribune*, July 2: This comparatively new district is located 30 miles southwest of Deming, and nine miles a little south of east of Hachita, and is most readily accessible from the latter point, through which ore shipments are made to Separ on the line of the Southern Pacific railroad—30 miles from the mines. The district is about five miles square and includes a group of comparatively low mountains, known as the Apache hills. There are not, properly speaking, any mines in the district. There are two prospects in which the development will exceed 100 feet each, and quite a number of others upon which some work has been done—almost uniformly with encouraging results. The two prospects referred to are the Copper King and Mammoth. They are adjoining and parallel locations on either side of a porphyry belt which averages 150 yards in width. Both are found in spar line, the principal part of the work having been done at the contact with the porphyry. The belts of spar are each from 60 to 80 feet wide and the work in the Mammoth indicates that the ore deposits extend for a considerable distance, if not entirely through the spur. The lines of the porphyry are plainly marked for a distance of almost three miles, the general course being from northwest to southeast. To the west of the spar belt, in which the Copper King is located, a quartzite reef is discernible for a distance of five or six miles, along which some locations have been made. These are not far enough developed to give much indication of what will eventually be determined by the working of

them. It is at present a dry camp, no natural surface water being found nearer than Thompson's spring, seven miles away. Work in the mines is not yet deep enough to show water, and all that has been done has been at the disadvantage of hauling water for all camp purposes either from the spring mentioned or from Hachita.

ORE.—Silver City *Enterprise*, July 3: Richards & Swancout have struck a body of good ore in the Mangus, at Fleming. Colonel Hardee generously offers to donate five acres of land to any one who will build a smelter in this city. He has a splendid location. It has been given out cold from Black Hawk that the next party which undertakes to hold up the ore thieves will be met with bullets. We may expect a killing soon. Burr and Fairfield have secured an 800-foot contract on the St. Louis mine at Paschal. R. P. Samuel recently had the same contract at such a low figure that he was compelled to throw it up. Bremen's mill resumed operations on Monday last after having been closed down for nearly a year. The closing of the mill and the partial suspension of operations on the mine was caused by the heavy raids of the ore thieves, who got away with the rich metal while Mr. Bremen paid for the breaking of new ground. Mr. Bremen is now of the opinion that he has things in such shape that he can protect his property without going before the courts to do it. The mine never looked better than at the present time, there being a large amount of ore in sight, and enough already out to keep the mill pounding away steadily for a considerable time. The San Jose smelter, which was erected less than two years ago at a cost of perhaps from \$12,000 to \$15,000, was sold on Tuesday last at public auction. The plant was owned by Pope, Cole & Co., of Baltimore, general dealers in copper and lead, and who recently made an assignment.

OREGON.

CLEANUP, ETC.—Jacksonville *Times*, July 3: A cleanup is being made at the claims of Wimer & Sons and Deselles & Connell, near Waldo. A promising ledge has been discovered near tunnel 9, several miles north of Grant's Pass, and is being prospected. Swinden & Co. are about erecting an anastra to test the quartz now being taken from their ledge in Rock Point precinct. H. Kinney, of Medford, and others are prospecting a ledge in the Evans creek district, the ore of which promises well in silver. Green Bros., of Galice creek have bonded their ledge again, this time to an Oakland, Cal., Co. Will. Q. Brown represents the Californians. A. W. Sturgis, of Forest creek, suspended operations a few days ago, after having made a good run. He was unable to finish cleaning up, for lack of water. A great deal of prospecting is going on in the Evans creek district. Dr. Stanley, T. T. McKenzie, Blalock Bros. and others have located ledges that promise well. Neitz Bros. and Ed. Caton, who have been at the Yank ledge, returned yesterday. They report considerable prospecting being done there, but not much excitement exists. The main ledge has about all been located and a number of other claims have been taken up. So great is the extent of the original Yank that it has been traced many miles.

PINE CREEK GOLD.—Bedrock *Democrat*, June 29: Last Tuesday Mr. Henry Fowler, one of the original discoverers of the Pine creek mines came to our city and sold at the banking house of J. W. Virtue, 44 ounces of gold for which he got \$16 per ounce, amounting to the snug sum of \$704. Mr. Fowler and his partner in the discovery of the "Witman" mine pounded up 10 pounds of quartz in a mortar from which they realized the above amount. Mr. Fowler departed from our city yesterday on his return to the new camp feeling greatly gratified in the expectation that his fortune is now made in the discovery of his new mine. He and his partner will at once commence the erection of an anastra for the temporary working of the ore. He says that other ledges of equal richness have been discovered and located in the same belt of mineral. Crowds of prospectors are rushing into the new field and the district will soon be thickly populated. Placer claims on Pine creek show great richness and several parties will at once commence their working. The creek furnishes all the water necessary for their working. The camp is desirably located in every respect and easy of access. Two anastras will be erected at once in the new mines. The ore is free-milling and is wonderfully rich. On two of the new discoveries on Pine creek the owners are making \$25 per day each by the use of a mortar. The Pine creek mines are located in the high granite mountains that can be seen northeast of Baker City. Parties are daily outfitting in this city for the new mines. Over 2,000 men will be in Pine creek district within the next 30 days. Between 150 and 200 miners from Montana are on their way to the Pine creek mines.

UTAH.

REVIEW.—Salt Lake *Tribune*, July 3: The receipts of bullion in this city for the six months of the present year, excluding all receipts of ore, and not reckoning anything for such operations as make no reports save at the close of the year, were as follows: January, \$378,614.56; February, \$237,536.78; March, \$273,771.69; April, \$350,983.27; May, \$288,620.43; June, \$364,076.16; total, \$1,893,632.80. The above does not include, either, shipments of Horn Silver bullion to an unknown but considerable amount, from the smelters early in the spring. For the past week, ended with July 1st, inclusive, the weather has been sultry, but the activity in the movement of the metals has been fair. The receipts during this week in Salt Lake have been \$64,683.50 of bullion, and \$18,325 of ore, a total of \$83,008.50. The week previous the receipts were \$52,578.95, of which \$80,288.95 was bullion and \$12,350 ore. The Ontario shipped during the week 42 bars of bullion, valued at \$25,783.50, bringing the total for the year up to \$808,386.21, from which six monthly dividends of 50 cents each per share have been paid, amounting in aggregate to \$3 per share, or a total of \$450,000. Silver Reef furnished \$6,700 in silver during the week, of which two bars, \$3,450 came from Christy, and two bars, \$3,250 from the Stormont. The product of the Hanauer smelter for the week was nine cars of bullion, \$22,700. Riter bullion, eight bars, \$7,500, came in from Tintic during the week.

...SOLE MANUFACTURERS OF...

KENDALL'S PATENT
QUARTZ MILLS.

Having renewed our contract, on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that is claimed for it and give entire satisfaction.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. H. Hoskin et al.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.THIS CUT REPRESENTS OUR
IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

Machinery Buyers, Attention!

Miners, Millmen, Steamboat men, and all others wishing Machinery, will find a rare oppor-
tunity for a bargain in the following lot offered for sale by H. D. BACON:

- 1 BOAT ENGINE Complete, size 12x11 inch.
- 1 UPRIGHT BOILER, 56x7x8 inch, with ash pan and doors complete.
- 1 CAMERON PUMP, 12 inch steam and 10 inch water cylinder.
- 2 WILCOX PUMPS, 3 inch steam and 2 inch water cylinder.
- 1 BAND WHEEL, 4 feet diameter and 12 inch face.
- 1 PLUNGER PUMP, 1 1/2 inches.
- 1 DECK PUMP, 1 SMOKE STACK.
- 1 Lot of 1/2 inch, 3/4 inch, 1 inch, 1 1/4 inch, 2 inch and 3 inch Pipes and Fittings.

All of the above will be found in good order, and can be inspected, and further information
may be obtained, at 222 Fremont Street, San Francisco.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252 Market St., S. F.]

FOR WEEK ENDING JUNE 30, 1885.

320,995.—DARNER AND MENDER—Geo. F. Atkinson, S. F.
320,998.—ORE SEPARATOR, ETC.—Jos. Behm, San Jose, Cal.
321,003.—ORE ROASTING FURNACE—Wm. Bruckner, S. F.
321,005.—ROAD LOCOMOTIVE—Geo. G. Buckland, Tulare, Cal.
321,009.—AGITATING APPARATUS FOR PLANT WASHES—E. J. Delaney, San Jose, Cal.
321,090.—BEE-SWAX EXTRACTOR—J. D. Enis, Napa, Cal.
321,022.—ENDLESS ROPE TRACTION RAILWAY—A. S. Hallide, S. F.
321,038.—PIPE TONGS—Geo. B. Koons, Half Moon Bay, Cal.
321,130.—WIRE STRETCHER, ETC.—Ela Moore, Walla Walla, W. T.
321,051.—EXCAVATOR—H. Rengstorff, Mountain View, Cal.
321,054.—SCREW FASTENING FOR BOXES, ETC.—Eugene Ritter, Germany.
320,982.—R. R. SWITCH—J. R. Stephens, Portland, Or.
320,998.—HARVESTER FINGER BAR—W. L. Walker, Capay, Cal.
321,067.—RAKE FOR CONDUCTING GRAIN TO THRASHERS—J. T. Watkins, S. F.
321,135.—FRUIT DRIER—L. W. Parsons, Los Gatos, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT JAR.—Carlton Newman, S. F. No. 320,580. Dated June 23, 1885. This patent covers a new means of fastening and holding the lid or cover of a fruit jar to its seat. It consists of a bail passing over the top of the cover or lid, and bearing directly on its center, and a screw-band encircling the neck of the jar, and connected with the ends of the bail. This provides a simple, effective and economical fastener for the lids of jars. Mr. Newman, the inventor, is proprietor of the San Francisco Glass Works, where large quantities of jars are made every season.

COMBINED PAD-BUCKLE AND TRACE CARRIER.—Ogden Mallory, Auburn, Placer Co., No. 320,569. Dated June 23, 1885. This piece of harness consists in a combination of devices. It consists, broadly, in the union of a pad-strap buckle with a trace carrier. An ordinary buckle may be used with the trace carrier; but on account of a depressed center to the buckle, the pad-strap is adapted to pass in an approximately straight course. The advantage of having the course of the strap straight is that bending or kinking is prevented, so that the harness lies snugly, and there is no tendency to wear the strap.

FEED-WATER HEATER AND PURIFIER.—Geo. H. Malter, S. F., No. 320,077. Dated June 16, 1885. This apparatus consists of a chamber or vessel of considerable height into the upper part of which water is discharged in a spray; a centrally placed vertical perforated pipe, extending from the bottom up to a point about the center of the chamber, with branching horizontal perforated arms at the top, and an ingress-pipe through which exhaust steam is admitted from the engine. The space around the vertical pipe is filled with a material which will cause the lime or other substances held in the water to deposit, and a pipe from the bottom serves to blow off any free sediment from time to time. Within the vertical perforated pipe is a closed pipe extending up to some distance above the bottom, receiving clear water through its upper end and having its lower end connected with the feed-water pipe.

ANALGAMATOR.—Walter E. Koch, Soulsbyville, Tuolumne Co., No. 320,565. Dated June 23, 1885. An exterior cylindrical vessel, standing vertically, has a hollow shaft supported by a step at the bottom and a journal box at the top, said shaft being rotated by a pulley at the top. The lower end of the pipe has peculiarly shaped arms projecting from it and slotted, so that by the rapid rotation of these arms beneath the surface of a body of mercury a vacuum is formed which causes the material fed into the hollow shaft to be discharged through the slots in the arms, whence it rises through the mercury. Arrangements are made to prevent leakage inward of air, and there is a diaphragm in the tube to prevent a whirling motion of the mercury. Radial plates also prevent a resolution and movement of the body of the mercury.

Lost Papers.

If any subscriber fails to receive his paper promptly after making due inquiries at the Postoffice, he is urgently requested to notify this office by letter, that we may send the missing papers, and, if possible, ward against further irregularities.

PANORAMA visitors should be provided with Muller's opera glasses. 135 Montgomery street, near Bush.

Mining Share Market.

Mining stocks are rather dull. The Boards were closed for several days lately during the holidays, and now business is going again there is not much of it.

The financial condition of the principal active mining companies having their business offices in this city is hereby appended:

Most of the June expenses of these companies are included in the statement:

CASH ON HAND JULY 1, 1885.

Utah.	1,341 10
Con. Cal. & Virginia.	53,623 40

During the 5 days ending July 5th there were shipped from Salt Lake City 11 cars of bullion, 284,763 pounds; 27 cars of ore, 806,980 pounds and four cars of lead, 105,384 pounds.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

SCORES of miners and prospectors are engaged at numerous points near the Carson & Colorado line between Candelaria and Bishop creek in taking out ore and shipping it below for reduction.

Gold Mines For Sale.

Two small gold mines for sale, in Kern county, California. Ore has paid by assay \$20 per ton. Worked to a depth of 60 feet. The vein is 15 inches wide. The mines are within seven miles of the Southern Pacific Railroad. The owner is not in a position to develop them without aid. The purchase price is very reasonable and there is a good opening for any one to take hold of the claims and work them. Address W. L., P. O. Box 236, San Francisco.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of this whim is bolted to bed-timbers, thus avoiding all frame-work. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers.

327 First Street, SAN FRANCISCO, CAL

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)

This form of Ore Feeder is well adapted for its peculiar work.

Manufacturers of the Celebrated "Challenge" Ore Feeders for wet and sticky ore; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ores.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS.

39 to 51 Fremont St., San Francisco.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half-year ending June 30, 1885, the Board of Directors of the German Savings and Loan Society has declared a dividend at the rate of four and one-half (4½) per cent, per annum, on term deposits, and three and three-fourths (3¾) per cent, per annum, on ordinary deposits, and payable on and after the 1st day of July, 1885. By order, GEO. LETTE, Secretary.

PATENT

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn. The Respirators are sold subject to approval after trial and if not satisfactory the price will be refunded. Price, \$3 00 each or \$30 00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

330 Pine St. (Room 5) San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

PRICES GREATLY REDUCED.

IRON CLAD MANUFACTURING CO.,
22 Cliff Street, New York.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

PAT. OCT. 25, 1881.

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1871, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. - We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

RANKIN, BRAYTON & CO.,
BUILDERS OF
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING and REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

CABLE RAILWAY EDITION--THIRTY-TWO PAGES.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, JULY 18, 1885.

VOLUME LI.
Number 3.

The California Street Road.

One of the best built and equipped cable roads in this city is the California street line, the third one built here. The company was organized in 1876, Hon. Leland Stanford being the moving spirit in the enterprise. In thoroughness and completeness of details the work on this road is of the first order. Plans for the

No wood is used in the construction of the work, and only the best quality of iron and steel has been admitted. There is thus seen to be an almost indestructible roadbed, as strong as stone itself, and containing nothing liable to decay. Ground was broken July 5, 1877, and the last rail was laid December 8th. During the time of this extension work, from 250 to 300 men were employed.

leys are on the same plane as the rope, and situated under the street.

The engine and machinery are placed in an excavation at the Larkin and California street crossing. This excavation is 31 feet deep below the surface of the street, 110 feet long and 30 feet wide. The engines are placed under the building and sidewalk, while the driving gear and other machinery is under the center of Cali-

This company is reconstructing the road-bed on Fillmore street west to Cemetery avenue, filling it in with cement the same as the balance of the road.

The building of the company at the corner of Larkin and California streets is three stories high and fronts 70 feet on Larkin and 80 on California. It contains the office of the secretary, superintendent and other officers.

THE CALIFORNIA STREET CABLE RAILWAY, SAN FRANCISCO, CAL.

work were begun in March, 1877. The work was soon mapped out, and in the following month orders were sent East for the rails. These rails were made from the pattern of Henry Root, constructing engineer of the road, and were designed to enable cars to run without the jolting experienced on many of the other street railroads. The top looks like that of a "T" rail, and the "fish-joint" is used. The rails are of steel made by the Cambria Works, Johnstown, Pennsylvania. The roadbed consists of a solid mass of concrete cement, through which runs the channel containing the rope. The ribs of this channel are composed of "T" rail iron, bent in the form of a "U." This series of ribs is enclosed by cement, which is filled up to the rail, and forms a perfectly solid body as wide as the track itself. The cross-pieces are of iron, and the space between the rails is paved with stone blocks, over which liquid cement is poured. As the blocks rest upon the foundation cement, the whole structure is knit together and forms one solid mass.

On this road they have 12,000 feet of double track, and it passes in that distance over two elevations, the heights being 265 feet and 235 feet above base respectively, the valley between being 125 feet above base. The gauge is 3½ feet, same as the Clay street. This road, like Clay and Sutter street, has been extended beyond the length of its original construction, which was 8,800 feet, and which was constructed in a very substantial manner, the tube being formed of worn-out 65-pound rails and surrounded by concrete.

The engine-house is located in a valley about midway between the termini of the original section. Some of the grades on this line are quite heavy, there being a rise of 67 feet and 75 feet respectively in the distances of 412½ feet. This is the heaviest grade in San Francisco, except one block on the line of the Presidio Railroad, which has a rise of 78 feet in the same distance. This company uses a heavier rope than the other lines in this city, viz., 4-inch circumference, and the driving pul-

leys are on the same plane as the rope, and situated under the street. The engines, of which there are two, were made by the Hope Iron Works of this city. They are of 250 horse-power each, and can be used either separately or together.

One is sufficient to do the entire work, and one will be kept in reserve to be used in case of accident to the other. They are made to run at 90 revolutions per minute, if required, giving a speed of about 8 miles per hour. Complete the engines weigh over 60 tons. All the bearings are brass. The engine cost over \$15,000.

Beneath the street is the machinery and wheels over which the wire cable passes. As the rope comes in from Kearny street it passes around a large wheel in a loaded car standing on a track inclining at an angle of about 30 degrees. This car, by falling, takes up any slack that may be in the rope. The rope also goes over a similar wheel before it goes out, taking up whatever slack there may be there. There is also a loaded car at each end of the line, so that by all these arrangements 100 feet of slack can be taken up automatically.

Tracks run all through the building on every floor, and elevators are used for transferring the cars from one story to another. The floors are cement, having gullies in which the water is collected when the cars are washed.

Like other cable roads this one had a marked effect on the property near its line of roadbed. Blocks of land increased largely in value and along the road the finest residence property in the city is located. The hill property was heretofore in little demand, but since this road has been running it is now more valuable for residence purposes than any in San Francisco. Many palatial residences have been built on the hill, which is locally known as "Nob Hill." The line is largely patronized and has been very profitable to its owners. The road is a pleasant one to ride over, the view from the summit of the hill being very fine, and many persons ride out to the cemetery and back on these cars for a pleasure trip. The engraving on this page is a view of this road, on the steep incline of California street, between Stockton and Powell.

Cable Railway Propulsion.

[COPYRIGHTED.]

The following paper was read by W. W. Hanscom, of this city, before the Technical Society of the Pacific Coast:

MR. PRESIDENT AND GENTLEMEN—In presenting for your consideration a paper on Cable Railway Propulsion, I must premise my remarks by the statement that the subject is so comparatively new in its practical results, and so little has been done in the development of the system outside of San Francisco and Chicago, that we have but little of the experience of others which has been published upon which to rely for the collection of data. The subject matter of this paper will be mainly a collection of such facts and experiences as have come almost directly under my own observation, and such conclusions as I have arrived at are from the grouping together and endeavoring to find from these facts what constitutes some of the more important conditions connected with the construction and operation of cable railways.

The record which I have of the great number of persons who have directed their attention to this mode of propulsion of cars at once shows that the subject is not new, and that it has only waited until the particular time and conditions should arrive when it would be practically developed. This time arrived and the conditions were propitious, when the Clay Street Hill Cable Road was built, and from the time at which this experiment passed into the domain of practical and commercial success an increased interest has been manifested in the pecuniary results to be attained, in comparison with the hauling of street cars by horses, and I need not enumerate the list of inventors whose patents have a bearing on this subject, and number several hundred, but pass directly to the features of the cable roads constructed and operated in our city.

The Clay Street Hill Railroad.

In the construction of the Clay Street Hill Road, it was necessary to observe the strictest economy, as it was an experiment, or at least so considered by those interested, and consequently it was left to further experience to determine, in case of success, what should be the character and kind of material and workmanship to be adopted in the construction of additional cable roads.

In observing the condition of the street along which this road was to be constructed, it was found that it consisted almost entirely of grades, except at the crossings, which were level. These grades being in some places as steep as 1 in 6 3/10, and the steep grades made a sharp angle when leaving the level crossings, with curves of very small radius connecting the various changes from grade to level and from level to grade. The street was straight, so that there was only vertical and no lateral deflection. This was the serious matter, as in leaving a level crossing for a steep upward grade, the strain on the cable would bring it upward and through the slot of the tube made for the connecting bar between the car and the rope. Consequently it would require a sheave above the cable to keep it down at these points, so that while sheaves were used to support the cable when the weight and strain were downward, they were also required at certain points to counteract the upward strain, and whatever arrangement or apparatus might be used to correct the cable with the car, that part which clasped the cable must pass above the sheaves placed under the cable to support it and must also pass under the sheaves which were placed above the cable at points which were required to be kept down. These sheaves therefore must be at such distance apart, vertically, in reference to each other and the track (over which the wheels of the car which carried the gripping apparatus were to run) that when the car would be immediately over one of the sheaves which was under the cable, that the bottom parts which clasped the cable would be some little distance above the sheave, so that a slight variation of the car or gripping apparatus in height would not bring the grip and sheave in contact. Also when the car is directly over a

vertical part of the gripping apparatus which passes upward through the slot of the tube and connects with the car, must be so located that it will pass to one side of the sheave above the cable, and this is arranged by projecting the part which clasps the cables sideways from the vertical part, which is shown by the drawing. (See Fig. 1.)

It will be seen that when the cable is held in the clasp, (or, as they are called, the jaws of the grip), it is lifted above its normal position in the groove of the lower sheaves, and also that it is carried down away from the sheave, which is used to keep the cable down where sharp angles occur at upward change of grade.

This drawing shows the upward tendency of the cable in crossing a street and going up a grade; it being lifted from the lower or carrying sheave, and brought up against the under side of the top or depression sheave. (Fig. 2.)

This accedes to the conditions so far as a line is concerned, when there are no horizontal deflections occurring, and there are none on the Clay Street Hill Road.

FIG. 2.

The form and size of the gripping arrangement being determined upon, such space between the lower and upper sheaves must be allowed that the grip will easily clear each, and some additional clearance space for variations which may occur in the height of the grip by the wear of the wheels, or variations in the level of the track in reference to the tube, added. Then the diameter of the sheaves being fixed, this fixes the depth of the tube, and the width will be fixed by the width of the grip and sheaves and necessary clearance.

The Underground Tube.

In constructing the Clay Street Road, wood was used to a large extent. Cast iron frames were made to conform to the desired cross-section of the tube, and placed about three feet apart, they having ribs, cast on them, so that planks two inches thick could be laid from one to another, and held in position by the ribs, thus forming a tube of wood with supporting ribs of cast iron. (See Fig. 3.)

FIG. 3.

Ties extend laterally from these cast iron ribs, upon the outer ends of which are placed stringers which carry the rails. The castings, as shown, are open at the top, so that the vertical part of the grip may pass through, and close on each side of this opening, extending from one casting to another, are short car-lines, which are bolted at each end to the casting, thus keeping them at the proper distance apart and maintaining them in proper position. On top of these, and extending over several of the castings, are laid wood scantlings, which form the slot, and to protect the top from wear are placed iron straps fastened to the scantlings by wood screws. The surface of the roadway between the slots and the rails on each side is formed of wood plank, as shown. This forms the general construction of the tube from one end of the road to the other, except at the point where the cable is made to enter the engine house to be connected with the driving machinery.

Along the straight portions of the tube the lower sheaves are about nine inches in diameter; those above the cable being about seven inches, as it was considered necessary to keep the distance between the surface of the street and the upper, enlarged part of the tube as small as con-

sistent with strength to support the traffic of vehicles on the street, and also that the distance between the cable and the part of the car from which projects downward the vertical bar or shank (which has the grip on its lower end) shall be the minimum.

Change of Direction of Cable.

At the ends of the road are placed large sheaves, around which the cable passes to return, there being four tracks and two tubes, and the diameter of these large sheaves, which are placed with the axes vertical, is equal to the distance between the centers of the two tubes or sets of tracks, which is about eight feet. Experience in the use of wire cables had shown that where the cable makes any great change of direction, as a right angle or more, and even much less, the diameter of a sheave over which the cable passes should be about 100 times the diameter of the cable. In this road the cable was a little less than one inch in diameter, and the sheave about 96 inches. In order that the cars might be transferred from one

any traffic which may pass over it, as it may be in the middle of the street; therefore, the thickness of this cover, and the fact that the axis or shaft of the sheave is vertical, it requires journal bearings, both top and bottom, and this, added to the thickness of the cover, will carry the groove of the sheave some distance below the line of the cable in the tube, so that the cable at the point of leaving the tube to enter the chamber containing the large sheave will be deflected downward over a sheave somewhat larger than those supporting the cable in the tube, say 30 inches in diameter. (See Fig. 5.)

This large sheave is carried on a frame having wheels which run on a track prepared for it and of such a length that it may have a movement of 10 feet or more. A chain attached to the end of this frame or carriage passes over a sheave at the rear end of the chamber, and has a weight attached which maintains a tension on the cable passing around the large sheave, and will take up any stretch that may occur in the cable, and yet in case of excessive strain will yield and prevent rupture of the cable. A similar arrangement is at each end of the road.

At the point where the cable enters the engine-house the cable is deflected vertically over two sheaves eight feet in diameter, and thence at right angles to a horizontal direction, when they enter the engine room, passing over a driving drum; thence over an idle sheave; thence over the driving drum again and backward to a sheave under the street, under which it passes and upward over a second sheave to the direction of and into the tube, when it continues on its route. These sheaves and driving drum are all eight feet in diameter. The driving drum is geared to the engine so that the cable has a speed of 528 feet per minute, or six miles per hour. There are 11,000 feet of cable employed in one piece, and it makes a total revolution over its route in about 21 minutes.

Changing the Cars at Ends of Road.

In changing the cars at the ends of the road the dummy is disconnected from the car and first transferred, then the car follows and is connected again to the dummy, and the train is ready to start so soon as the cable has been taken into the grip. This grip is so constructed that the cable is admitted between the jaws from the bottom side, and, as by opening the jaws the cable falls out, dropping away from the grip down into the carrying sheaves under the cable, it becomes necessary, in order to get the cable

FIG. 4.

within the jaws again, either to raise the cable or to lower the jaws until they shall have brought the cable within them, and then raise the grip bringing up the cable to such a height that the bottom of the grip will sufficiently clear the sheaves. This grip is so constructed, that by a hollow screw at the top passing through a nut which is supported by a frame and encircled by a hand wheel, the turning of the nut will lower the hollow screw, and with it the gripping jaws, until they are low enough to take the cable, when the jaws are partially closed, so that while they will prevent the cable from dropping down it will still freely pass through and not draw the train until sufficient pressure is put upon it, which is done by means of a screw drawing a wedge between a frame and bar, thus forcing the jaws against the cable with any desired force, the power by this arrangement being as 480 to 1; in other words, one pound applied to the screw by the man operating the grip gives a pressure of 480 pounds on the cable, less the friction of the moving parts.

That the cable may be spared abrasion in moving through the jaws of the grip when the dummy is standing still and the cable passing along, four rolls, having their circumferences grooved to suit the rope, are so arranged that they are a little in advance of the jaws and support the cable before the jaws come in contact with it. A spring is placed behind these rolls, so that they may yield when the jaws are brought together to grip the cable.

The cars are of such size that they will seat 14 persons, and weigh, unloaded, 2,500 pounds each; the dummies weigh 2,850 pounds each, and have seats upon them for 16 passengers.

FIG. 1.

sheave which is above the cable to keep it down, the top of the part which clasps the cable must be a sufficient distance below the sheave that it will not touch in passing. In order that these requirements may be met, the

As the large sheave at the end of the route lies in a horizontal position, or nearly so, a large pit or chamber is required, and the covering of this must be of sufficient strength to sustain

As this road was extended after having been in operation about five years, some changes were made in the construction of the tube and in the cast iron frame, which was extended laterally, so that it now comes under and supports the rails, and has its base extending the same distance, the web being perforated in the center to the shape of the tube, and also openings between the central, and each side-rails or flanges being formed all around the openings and the outside of the frame. The tube in the extension is formed of concrete, and as it passes through the openings of the frame it forms a

FIG. 5.

monolithic structure, the length of the road to which this mode of construction is applied. The slot is formed by channel irons six inches deep, with two-inch angles top and bottom bolted to the casting, and wood carlines are placed from frame to frame only to support this wood plank which forms the street surface between the rails. (See Fig. 6.)

FIG. 6.

Sutter Street Road.

I have thus stated generally the most important features of construction in the Clay Street Hill Road, and in referring to the other roads will only allude to the more prominent conditions which involve changes in construction and operation, when they vary from the Clay street road. The next road to be operated by cable in this city was the Sutter street road, which had been operated by horses, but in 1876 was converted to a cable road. The more prominent change was in the construction of the gripping apparatus, which was arranged so that the jaws which take and hold the cable are moved vertically, so that the cable enters between the jaws of the grip from the side instead of from the bottom, as does the one in use by the Clay street road. These are distinguished from each other by the direction from which the cable enters the jaws. That of the Clay street entering from the bottom is called a "bottom grip," and that of the Sutter Street entering from the side is called a "side grip." (Fig. 7.) The side grip is so constructed that it cannot be lowered like the Clay street grip to take the cable, but has a fixed position when placed on the dummy. As the cable will normally lie directly under the jaws of the grip, either the jaws or the cable must be moved sideways to allow the cable to be brought up to a height which will allow it to enter the open jaws of the grip. As the readiest means of accomplishing the raising the cable, a sheave is so placed in the tube that the cable will be raised by it to a height corresponding to the opening of the jaws; but as without lateral movement of the grip it would strike the sheaves, the rails and iron forming the slot are deflected to carry the dummy and with it the grip to one side sufficiently to pass the sheave, and immediately again the track and slot is deflected into its normal direction, thereby bringing the opening of the jaws over the cable before the cable has sagged or dropped sufficiently to prevent it entering the grip.

FIG. 7.

In the latter constructions of the grip, the points at which it is supported on the car are so arranged that it may vibrate from this point laterally, so that the dummy need not be carried bodily sideways; therefore only the irons forming the slot are deflected. Wherever it is desired to let the rope out of grip and take it up again the road is formed in this way, these points being determined upon in advance. (Fig. 8.)

Different Constructions.

The plan for switching from one track to the other is different from that in use on Clay street. A tube is constructed leading across from one main tube to the other, and, following the curve of the rails which transfer the car and dummy from one main track to the other, the tubes are joined at the point of intersection. The slots of the tube join similarly, and a tongue is placed at the junction of the two slots to cover the large opening into the tube at this point, and is also used to direct the shank of the grip into the proper slot.

These dummies and cars are not turned round in the operation of switching, as by the method by turn-tables on Clay street, so that the cable lies on the same side of the tube, or rather the same side of the slot, in both of the main tubes. Of course, in switching or passing from one main tube to the other, the rope is dropped from the grip, and as the dummy passes on to the main line the cable is brought up so that the grip may run on to it, as before described. At points where the car and dummy are transferred through a switch, it is necessary to have a falling grade, so that, after dropping the cable, gravity may assist in carrying the dummy through the switch and on to the other main line. Where the street is officially level, latitudes has been allowed the cable companies to make a grade to suit their desires.

At the point where the cables enter and leave the engine-house, there is an intervening space between the two large sheaves which deflect the cable from and into the tube and engine-house. The cable is dropped from the grip just before reaching these sheaves, and a slight grade is given the street in the direction in which the car is moving, so that the car and dummy will start themselves or be carried over by gravity.

The driving drums are different from those

in use on Clay street, where the drum has clips on its periphery in principle of action like Fowler's for driving wire ropes; while in Sutter street there are two single grooved drums in line with each other, one being slightly higher than the other. (See Fig. 9.)

These are so placed that the cable coming in from the street will lead fairly on to the highest, which is in the rear, or farthest from the street. Passing around this, the cable is led

FIG. 8.

wrought-iron, reaching out and supporting the rails, which was copied in the later construction of portions of the Sutter street road above alluded to. In the case of the California street road, however, the main element of the wrought-iron works was made of old rails. (See Fig. 10.)

At the location of the engine house, ground area being limited, the driving drums for the cable were placed under the street, one under

FIG. 9.

forward and up, over, around and down under both of the drums, forming the figure eight nearly. Thence the cable goes backward and around a vertical sheave, which is carried by a carriage which can be moved on ways or rails provided for it. After passing around this latter sheave it goes forward again over the two driving sheaves or drums to the sheave in the street, by which it is again deflected into the tube.

The movable sheave around which the cable passes before reaching the street is arranged with a chain and weight, so that a definite amount of tension can be placed upon the cable, proportionate to its size and the work it has to do. This road has one other feature not in the Clay street road. That is, horizontal curve. The Larkin street cable passing a right angle from Polk into Post and from Post into Larkin

and back again on the return track for deflecting the cable around these curves, which are from 40 to 50 feet radius; a series of horizontal pulleys, having no grove—but straight faces with a flange on the lower edge, are placed on the inner side of the curve about three feet apart, so that the deflection from one pulley to the next is slight. These pulleys are about 20 inches in diameter, and are set in iron cases which carry the bearings for the upper and lower journals of the upright spindles or shafts. The cable runs against the faces of these pulleys, and they are set far enough to one side of the slot so that this grip in moving along would easily pass them; but to avoid positive contact between the grip and these pulleys, a bar of iron is placed around the curve, just above and a little in advance of the faces of the pulleys, and at a point on the shank of the grip, which would come opposite this bar, is placed a piece of iron called a wearing piece, which, being made smooth, comes in contact with and slides along the bar, thus keeping the jaws of the grip from contact with the pulleys.

The method of applying power to the grip used on this road is by a long lever, its short arm of which forms one part or joint of the knuckle or toggle lever, while the power is applied on the Clay street grip by means of a screw, or rather to a nut working on a screw, the nut being enclosed in and fastened to the hub of a hand wheel.

The construction of the tube for this road was originally similar to that first used on the Clay street, that is cast-iron frames and a tube of wood, but later the construction of the tube has been made by the use of wrought-iron

FIG. 10.

frames reaching to and supporting the rails, and making a skeleton tie for the rails, slot irons and tube, which latter is formed of concrete.

California Street Road.

The California street road, which was the next one built after the Sutter street, is similar in its conditions to the Clay street, but having some steeper grades, and as it was intended for heavier traffic a larger cable was used being one and one-quarter inches in diameter.

The tube is constructed of a frame of

Geary Street Road.

The Geary street road is similar in general conditions to the Sutter street, except that it has no curves, the road being straight from end to end, and the angles at these changes of grade are so slight that no depression sheaves are used to keep the cable down.

The grip used on this road is a "bottom" grip, but is operated by a lever applying the principle of the toggle joint.

The cars are transferred at one end of the road by a switch like Sutter and California streets, but at the other by a turn-table. The turn-table being of a diameter sufficient to hold one car is placed with its center of revolution in a line with the center of the outgoing track. The incoming track is curved, and the straight portion running onto the turn-table forms an angle with the outgoing track of about 30 degrees. This economizes space, and dispenses with the second table as used on Clay street. The driving drums in use on this road for moving the cable are different from any other road, there being two, and each having several concentric grooves so that the cable is passed around the two drums until a sufficient number of wraps are made to prevent slip. In this case no tension sheaves are used to give adhesiveness to the cable around the drum. Four or five wraps of the cable are all that is necessary. The tension sheaves, for taking up the stretch and slack of the cable are on movable carriages, and are drawn backward by a long screw.

The Union street or Presidio road Ferries road has the steepest grades of any road in the city, and has one horizontal curve, where the line passes from Montgomery avenue to Union street. In this case the cables are led away from the curve of the track, passing around large horizontal sheaves to change the direction of the cable from one street to the other, and the grades at the curve have been so modified that the cable having been let out of the grip, the train passes the curve by its momentum, assisted somewhat by gravity.

The driving drums are the same as used on Clay street; also the grip.

The transferring of cars and dummies at the termini are by switches, turn-tables being used only at the engine house for turning the cars on and off the road.

The Market Street Road.

The Market street road, the latest built, has some features different from all others. The construction of the entire railroad bed is the same as California street, except in the form of iron work of the frames for the latter, which is of the same kind of materials as are used on California street. The cars carry the grip instead of having a dummy, as on all the other roads.

The driving drums are the same as are used on California and Sutter street roads. At the junction of Market and Haight and also at McAllister streets, the Market street cable is dropped, and the cable running in Haight and McAllister streets is picked up, as the car is carried by its momentum around the curves into either of these streets, assisted by the gravity due to a grade modified for this purpose. At the curve on Market and Valencia streets an auxiliary cable is used for bringing the cars past the engine house. This cable is used only on one track coming east, the cars going west having to drop the cable and are carried around the curve by gravity. The speed of this cable is one-half that of the main cables, and it is driven by a grooved pulley or sheave on the line shaft which carries all the other driving drums.

The cables on Market, Valencia and Haight streets are driven by the same engine, while a separate engine is used for operating the McAllister street cable. At Haight street, the curve from Market street is passed the same as on the Union street road at Montgomery avenue and Union street, but at the junction of McAllister and Market after dropping the Market street cable, the McAllister street cable is picked up before reaching the curve, and grip holds the cable while passing it, the horizontal pulleys around which the cable passes being arranged similarly to those heretofore referred to at the corner of Post and Polk, and Post and Larkin streets on the Sutter street roads.

At the termini of these roads, the Market, Valencia, Haight and McAllister streets, which comprise the Market street Company roads, the cars are transferred from one track to the other by a turn-table somewhat similar to that used at the end of the Geary street road, with this difference: On Geary street the dummy or car is not turned around, but either end runs foremost, so that in changing the turn-table from the incoming to the outgoing track the table is moved through only thirty degrees.

On the Market street cars the grip is placed on the truck at one end of the cars so that the car requires to be turned half way round at each end of the route. The table in this case has to be moved through 180 degrees, and there are two parallel tracks across this turn-table, each equidistant from the center, the distance between the centers of the tracks being equal to the distance between the centers of the main tracks, so that when the table has been moved so that a car is in position to go off, the other track on the table is in position to receive a car from the incoming main line. As these turn tables are large and heavy they are turned by gearing driven by the main cable, through a grooved pulley, which being connected with the gearing is brought against the cable with sufficient pressure to give the desired

(Continued on page 38.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MOORE.—Amador *Ledger*, July 11. All indications point to this becoming one of the gold producers of the county in a short time. As soon as the water was extracted the beginning of last week, work was commenced in extending the drift north at the 180-foot level. In the previous working of the property, this drift was turned in an easterly direction; but the present management concluded to continue its northerly course at the point where it was deflected. After running about 10 feet an immense quartz ledge was cut. We have been informed that this vein is 25 feet wide between the walls; 9 or 10 feet of good milling ore appears next to the hanging wall, and 5 feet of pay rock next to the footwall, with about 10 feet of barren quartz between. Many years ago this same vein, worked at a point nearer the surface, paid \$7 per ton in free gold. A contract was let this week to extend the tunnel at the 180-foot level 200 feet further. The ore-body has steadily improved as the tunnel has advanced.

MISCELLANEOUS.—The South Spring Hill shaft has reached the 700-foot level, with a 25-foot sumpt below that level. The mill is running steadily, with plenty of ore to keep it going for an indefinite period. Ten stamps of the Amador Queen mill were started this week for a short time. The Amador Canal is unable to supply water to keep the mill running to its full capacity at present. The Potosi mill near Drytown has been running for over a month, under the management of A. N. Peterson, of Sutter creek. One clean-up has been made, which was satisfactory to the lessee, C. H. Thomas. The 10 stamps were kept going on a mixture of quartz and dirt, crushing nearly 40 tons per day. Only two men are required to keep the mill supplied with rock. The Mahoney mill has been started on ore from the Wabash mine, situated between Sutter creek and Amador, and owned by C. Hammack and L. T. Lewis. The appearance of the plates indicate a profitable run.

CANAL MATTERS.—The Amador Canal Company has a force engaged in repairing flumes near the head of the ditch. This work necessitates shutting off the water for several hours each day, and the water supply for the mines has run short in consequence. The McLaughlin ditch above Volcano is being enlarged. A contract has also been let for extending the ditch nine miles, so as to tap Panther creek, thereby securing a new water supply. Tim Hanley has secured the contract, and the work will take three months to complete.

Butte.

STRUCK IT RICH.—Griddle *Herald*, July 10: After many years of hard scratching, during which he has many times been flat-broke, that old pioneer Dr. Burwell has at last "struck it." 'Tis a claim lying close to the famous Perschbacher mine, in Magalia district. Two weeks ago he was offered a certified check for \$100,000 for the property and declined to trade. In a few months he will again be on his feet.

MIocene.—Oroville *Mercury*, July 11: We have been to the Miocene mine. The Martin elevator has been operated there but one day, yet it has been demonstrated that it is all that is claimed for it. Just as fast as ground is worked out the excavations can be filled, and every particle of debris retained on the ground. The Miocene ground is exceptionally advantageously situated. Between it and the river there are several deep cuts which can be used as dumping ground, and made to safely and everlastingly hold all the dirt that two monitors can wash out in ten years. The working of this elevator must be seen to be appreciated. All water and debris which is at first washed into the bed-rock flume, just as it leaves the lower end of this flume, is washed by the main pipe into the elevating tube, the upper end of which connects with a flume that is 25 feet above the ground. This flume can be carried in any direction, and the debris from the mine deposited in a given place with absolute certainty. This company can deposit 10,000 cubic yards of earth in the cuts and canyons below the mine, and there it will remain. Mr. Davis thinks the mine will pay by this process. We have lately visited the Oro River Mining Co.'s mine. It is a part of Feather river channel, five miles above Oroville. The work is under the superintendency of Wm. Mower and C. C. Belding. The plan is to wing-dam the river ore 230 feet and by clearing that distance, secure the gold in the bottom of the stream by means of washing. Twelve men are at work, and they are progressing finely. A partition or "crib" will extend about 230 feet up and down the center of the stream, which is about 100 feet wide, and at the upper end of this partition a head dam will be built, extending from the partition to the east bank of the river. This will dry half the channel in width and the length of the partition, making it easy to secure the gravel on the bed of the river thus dried. The water accumulated in that portion of the channel will be pumped out. The company hopes to have the wing dam completed and be ready to begin mining during the next two weeks. Old miners say the river there was very rich in early days, and as but little of the channel was ever cleaned, it is reasonable to suppose that much gold remains there yet. The managers are working with a will, and are confident that they will reap a rich reward. They are spending a good deal of money, and expect to take out five times as much as they put in. We hope that they will not be disappointed. If their venture is successful it will lead to a boom in river mining in Butte. The gold is there, and we believe that this company will find it.

Inyo.

MAMMOTH DISTRICT.—Cor. Inyo Co. *Register*, July 10: In what is called Pine City, there is an arastra at work, and it is my impression Mr. Albright, the proprietor, is doing very well; but the primitive way he has of roasting the ore I do not think equal to the extracting or saving all the precious metal it contains. The character of the quartz is good, and it contains free gold and gold sulphurets; also quite a percentage of silver. If the arastra gets much more than the free gold it will do well. We also visited the new camp of Lisbon,

about two miles further up, the mine being in the same formation and mineral belt. Here a few earnest workers and owners are erecting a good five-stamp mill, and they are doing their work well, working as if hopeful of a fine success—and may be assured that they have the good wishes of everybody to that end. The ore is about the same class all along, although in this Lisbon mine I believe it is of higher grade than is being worked in the arastra. The work done shows ore to a considerable depth, and working from their lower tunnel they will have rock to last them some time. To the mill, not over 300 feet below, a tramway will be built. The mill is run by steam; plenty of wood is near at hand. The great drawback is the 10,000 feet elevation and the heavy fall of snow. The snow shoes standing up by the cabin door gave us a little chill. We were told of some exciting trips out for provisions in the winter; but of course they can be well prepared to stay in and the mines can be continually worked. We were told of fine prospects in the vicinity and on the head-waters of the San Joaquin, only a few miles away. Also, we found on the way down that the old Minnietta mine, on the south side of Long valley, close by Convict lake, was being examined, and its worth may be proved before long. The formation is the same in my judgment as at Mammoth. The Minnietta mine is in the Laurel Hill district, as is the Maxwell mine, which also gives evidence of merit and shows considerable development.

SILVER MOUNTAIN.—Inyo *Independent*, July 11: John Eddy has a few men at work in the old Silver Mountain mine, in Coso district. This mine was worked over 20 years ago, and a good deal of money was then expended upon it, but the work was abandoned before the mine was developed. There is at least 300 tons of ore on the old dump, and the work now doing by Mr. Eddy has already developed a good deal of ore in the mine. If present indications continue very little farther Mr. Eddy says he will build a mill. Wood and water are plenty.

NORTH UNION.—Hawley & Company have lately put a force of men at work in the North Union mine at Cerro Gordo. For a long time past a little work had been doing at the mine, but now work is pushed vigorously. A good deal of ore had formerly been taken from the mine, but at great disadvantage, as it had to be handled too much to get it to the surface. The men lately employed are running a tunnel that will allow the ore to be got at easily; the prospect for the mine is very good.

NEW FIND.—About five miles from Panamint Junction, on the road east of Darwin, Ned Mantin recently discovered a three foot ledge of gold ore that promises well. John Eddy reports having examined some of the ore, and thinks it would go over \$400 per ton. Mr. Eddy says he will soon crush a lot of the ore in the mill, and that will determine the value of the claim. At Lookout Frank Fitzgerald has a large quantity of ore at the furnace, and is all ready for a run, except that help is scarce. Very few unemployed men are in that region now, perhaps not one.

Kern.

KRAMER CAMP.—Cor. Los Angeles *Herald*, July 11: Kramer was discovered about a year ago, and derived its name from a railroad station by that name on the A. & P. road. It is 40 miles east from the town of Mojave in the midst of the great Mojave Desert, and within 4 miles of the A. & P. road. The great drawback to the camp is the total lack of water, even for drinking and culinary purposes. The miners there at present get their water used for drinking purposes from the railroad depot; but as there are but four or five persons there little water is required. The water used for cooking their meals is obtained from a saline spring a few miles from the mines, which is owned by a gentleman residing in Los Angeles. The spring affords but little water, however, not more than 30 gallons per day, and that being too salt for drinking it is of little value. Only a little over a year ago the locality was uninhabited save by the depot agent, a Mr. Quinn, who in the sandy solitude around him was truly monarch of all he surveyed. But the prospector came; his solitude was broken up; some copper ledges were discovered and located, which were quite rich in that metal; but the low price of copper and the numerous disadvantages attending upon mining in the desert greatly discouraged effort, and the camp came near being abandoned, and doubtless would have been but for the perseverance of Wm. Kilgore of your city, and J. R. Maxey and J. L. Coffman of Ventura county. And to Mr. Maxey, I believe, belongs the credit of discovering gold there. This he did some months after the location of the copper ledges, and the discoveries then and since made are very rich in the precious metal. Moreover, the surface indications of the camp as well as the prospects and formation are all of the most encouraging nature; and little is as yet said or known about it. I here predict a future for Kramer as bright as that of any gold-mining camp in all California. The ledges are large and straight, with a nearly east and west course, slightly north dip, but almost perpendicular. The prospects run by the horn-spoon process from \$10 to \$500 per ton. These figures, however, are the extremes; the mean, of course, is something less. But of the best prospecting ledges there it may safely be said that they will mill from \$25 upward to the ton. The Coffman, a ledge 4 feet wide and probably the largest as well as the richest ledge in camp, prospects very high. It has been sunk on 25 feet, and I honestly believe it will mill \$25 taken clean from wall to wall. I am a miner of nearly 35 years' experience, and am fully aware of the magnitude of the above estimate; but I believe it clearly within the bounds of reason, large as it seems. It is the property of the Coffman Bros. and Maxey. The remaining ledges worthy of special mention are the Tip-Top, owned by Wm. Kilgore; the Golden Era, owned by G. J. R. Maxey; the Free Gold and Hope, owned by Maxey and the Coffman Bros.; and the Silver Age and Mint, owned by G. Cummins, Garrison and Sutton. All of these mines are good property, if situated where water could be obtained for the reduction of their ores, or even if there was a mill convenient and reasonable shipping rates could be obtained. But I know of no gold mill in this vicinity, and silver miners here inform me that rates on gold ore to San Francisco are \$18 per ton. Buyers of ore charge \$5 per ton for sampling, \$14 for working, \$18 for shipping, and then discount the product \$8 per ton. So you see there is worse than nothing left for the poor miner, and Kramer with its 25 ledges and probably fifty or more valuable mines, must lie idle and keep 1,000 men out of employment until their rich ores can be milled at a profit. Quite a number

of the Kramer ledges have been sunk on to depths varying from 10 feet to 40 feet, and the result in every instance but one has been a marked increase in the richness of the ore obtained, the prospects in some of them—notably the Silver Age, Tip-Top and Mint—having more than doubled in a few feet—another most favorable indication, certainly.

Los Angeles.

THE ALPINE PLACERS.—Los Angeles *Herald*, July 9: Considerable inquiry has been caused in our community by the recent notice of the Alpine gold placers. Since that time news have been received from L. D. Gavitt, who has charge of the dry washer, that its success exceeds his most sanguine expectations. This will be good news to all our placer miners who are working in dry districts, for it obviates the water difficulty which has always been the great obstacle to success. The owners of the Happy Thought mine, who are now present in the city, are so elated that they will hold a meeting at the Sportsmen's Headquarters, corner of Washington and Main streets, this evening at 8 o'clock, for the purpose of organizing a joint stock company. As soon as this is effected, an active mining campaign will be commenced, new machinery will be added and stock put upon the market. When this is done the company will open an office and notify the public by an advertisement in the daily papers. It is evident from the statements of those who have been on the Alpine placers that the development of these mines will help not only that section, but all the country.

Mariposa.

MT. RAYMOND MINES.—Mariposa *Herald*, July 10: It begins to look as though there would shortly be a revival of the excitement concerning the Mt. Raymond mines. A party of experts were up there last week and we are told that they are more than pleased with the outlook. The ore taken from there last summer was sent to England and tested and the result was highly satisfactory. The only question was whether the ore body was large enough to justify the expense of reduction works. The visit of the experts last week was to decide that point, and their report will be favorable. It is reported that smelting works will be put up at Fish Camp right away.

Mono.

CON. PACIFIC.—Bodie *Free Press*, July 13: During the past week have been engaged in cutting out a station for winze on the vein west of No. 3. Progress, 9 feet.

MONO.—At the Mono the joint cross-cut on the 400 level has been extended during the past week 9 feet. Winze No. 2, 550 (Lent shaft) level, 400 feet from the Bodie line is down 25 feet. Five men employed.

STANDARD CON.—For the week ending July 11th the north drift on 400 level was advanced 12 feet. East upraise on same level has advanced 10 feet. Drift on 440 level has advanced 9 feet. North drift on 560 level has advanced 15 feet. Drift on 500 level has advanced 8 feet. Drift 280 level has advanced 12 feet. The mine continues to look well.

BODIE CON.—The joint Mono and Bodie cross-cut on the 400 level of the Mono has been extended during the past week 9 feet. The east cross-cut 700 (Lent shaft) level is now in 100 feet. The south drift on the same level is in 52 feet. The upraise above the 300 level is up 29 feet. The upraise above the 400 level is up 11 feet. Twenty-eight men employed.

WAGES AT QUIJOTOA.—*Beef and Bullion*: The announcement that the rate of miners' wages at Quijotoa has been reduced to \$3 a day will surprise very few. Arizona is the only considerable portion on the Pacific Coast where the \$4 rate is still general. The example of Tombstone and Quijotoa will soon be followed in all other camps in the Territory. Miners must prepare to accept the inevitable. There are very few mines that can afford to pay \$4 a day for labor.

BIG BUG.—Prescott *Courier*, 12: As was recently stated in this paper, Schofield & Co., of Big Bug district, are tunneling into two pretty good gold mines—the Poland and Hamilton. The tunnels will be long ones, so as to secure large supplies of rock for the mill, which has made a couple of very successful "runs." This mill, some of our readers may remember, was recently erected by Messrs. Church & Gray. It consists of a battery, shaking tables, jigs and concentrators. It is said to be a cheap and simple contrivance for saving gold. If we are correctly informed, the use of quicksilver is dispensed with, and the cost of running the plant is very light. Considerable free gold and three carloads of concentrates are results of two short runs. Another mill, similar to this, is about ready to work in Turkey Creek district, and we know a mine owner who has about concluded to have Messrs. Church & Gray put one up for him. The Del Pasco 4-stamp mill (old style) is doing good work on Del Pasco rock, which continues to yield gold in paying quantities. It pleases us to be able to keep repeating accounts of Mr. Dawes' success at Alexandria, Peek district. The silver he ships in here comes out of Peck mine tailings. Concerning operations of the Rescued mining Company, we need only state that the mine is opening up finely and that they hope to have the mill ready for running about the first of next month. Placer mining, owing to scarceness of water, is almost at a stand still, in consequence of which gold dust is pretty scarce.

YOUNG AMERICA.—*Mountain Messenger*, 13: Work at the Young America quartz mine, under the supervision of Supt. A. C. Busch, is progressing rapidly and satisfactorily. The mill building is enclosed, and the supports for the ramway are all in place and the wire rope stretched. The rope will be spliced, the buckets attached and the inclined way to carry the load which is to take up the stretch of rope and at all times keep it taut, will be completed in a few days. The superintendent thinks they will have water enough to run during the rest of the season, as the lake is still filling. This mine is highest in the country, being 7,000 feet above sea-level—2,000 feet higher than the Buttes mine. It is thought that the mill will be running by the first of August.

Plumas.

LUCKY S.—*Greenville Bulletin*, July 11: Benj. Harvey, Superintendent of the Lucky S mine, was in Greenville Saturday. He reports good progress. They had just "cleaned up" after crushing 32 tons of ore, which averaged \$19.92 per ton. A larger

force of men has been put on, and work will be prosecuted with energy.

THE GLAZIER.—This is a placer claim about 5,000 feet long, situated on the north fork of Feather river. Several men are now employed working on good pay ground. The channel has been followed 75 feet already, and the entire length prospects well. No cross-cutting has yet been done, hence the width is not known, but is believed to be between two and three hundred feet. Fortunately for the owners, the mine is so located that an immense quantity of water can be applied with very little expense.

HOPKINS CREEK QUARTZ.—*Plumas National*, July 11: Capt. Donahue of Hopkins Creek was in town this week, and showed some very rich quartz taken from his ledge, which he informs us is about twenty feet wide. Cap. certainly has a prospect for a fine mine; he is a stayer, and will develop it if anybody can.

San Bernardino.

THE CALICO M. & R. CO.'S MILL.—*Calico Print*, July 11: On the morning of the 4th the new 5-stamp quartz mill, built by the Calico Mining and Reduction Co., was set in operation for the first time. The mill is a few yards above the Jaggett Sampling Works, and the stamps of the former are operated by means of the engine contained in the latter. The first day or two was spent in testing and adjusting the new machinery so as to run without any necessary friction. The stamps have been reducing ore a greater portion of the week, but possibly it may be necessary to put in another boiler, in order to operate the engine at full speed. This will be determined by further tests.

Shasta.

STRUCK THE LEDGE.—*Shasta Democrat*, July 11: It is reported that Derby & Co., who bonded the Whitton & Small mine on Squaw creek, have struck the ledge with their tunnel and found a strong vein of rich quartz, which insures the purchase of the mine. Selden Mead, Mr. Bentz, Chas. Boardman and Jim Mead, while on a recent prospecting trip on Scott mountain, struck a quartz vein to feet wide that they affirm prospects well in silver. The find is within about three miles of the Altoona quick-silver mine. They have located and recorded two locations and did \$100 worth of work on each. The boys feel sanguine that they have struck a good silver mine.

FRENCH GULCH MINES.—*Republican Free Press* July 11: F. W. Wheeler, of French Gulch, was in Redding Wednesday and gave us the following reliable items: The shipment of bullion from French Gulch for the month of June amounted to \$22,250. Hall & Espy, two railroad men off on a vacation, made a rich strike this week on Boswell gulch, four miles from the Gulch. They have a tunnel in 70 feet, and are down a few feet on a five-foot ledge, with rock from \$15 to \$20 to the ton. The Washington mill is crushing on rock from the company's mine, but expects to shut down soon for want of water. The Scorpion boys recently had 72 tons of rock run through the Niagara mill which panned out \$1,900 in bullion. The Niagara is running all the time, and has been crushing some very rich rock. Wheeler & Son are opening up a new mine. They are down 15 feet and have a foot ledge between the porphyry and slate. It looks very favorable. The Highland mine is again being opened up. Some 9 or 10 men are employed in running tunnels and sinking shafts. Over on Deadwood McDonald Bros. & Franck are down 125 feet and have drifted 100 feet west on the ledge, which shows a large body of high grade ore. Fifteen men are employed. The Watt mine, formerly known as the Lambert, is being worked by 23 men, who are taking out a large quantity of low grade ore—say \$12 to the ton. Gipson & Co. have a ledge from a foot to 15 inches wide and very rich. George Kline has just had 500 tons of ore crushed at the McDonald mill, which averages from \$12 to \$15 to the ton. His mine, bonded about three months ago by Shattuck & Co., is worked by several men, and the rock taken out is good.

Trinity.

NEW RIVER.—Cor. Yreka *Union*, July 9: New River news is rather scarce. I was over there a week ago, and found the camp very quiet. The mines are suffering from the lack of crushing facilities, and it will doubtless be some time before there is any chance for the place to look lively, although there is not the least doubt that the mines will eventually prove a success. I was kindly shown over the "Hard Rock," at present the most promising and best developed mine in the district. This is owned by Messrs. Ladd and Clements—the latter an old Salmonite. There has been an incline shaft sunk 180 feet in depth, and the rock throughout is of the most promising character. On Methodist creek there is a good deal of work being done in the shape of quartz prospecting, and several different parties are working steadily testing their finds. I also saw some quartz from the claim of Donaldson & Hagenah on Plummer creek. This claim has some very rich rock, and the owners are now testing the ledge by sinking on it.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, July 11: The winze is now down exactly 32 feet below the 3,000 level, and timbered in fine order throughout, as a handsome, roomy, double compartment winze. It has been sunk by the aid of a hand-windlass thus far, but a hoisting engine will be placed in position to-morrow or next day, driven by compressed air, to do the hoisting work. In chambering out for this engine on the east side of the winze station, on the 3,000 level, the rich ore body or vein is found to extend further in that direction than was supposed. This indicates very significantly that the ore vein which is being followed down by the winze, bears and widens toward the east, and is more than liable to develop into a genuine bonanza in that direction. In view of this fact the incline will be turned a little more to the east to-day. It has thus far been sunk at an angle of 60 degrees, which proves to be more to the perpendicular than the vein is. The sinking of the Combination shaft deeper below the 3,000 level is actively commenced, with four six-hour shifts of miners, 12 on a shift, or 48 men in all during the 24 hours. It is already down 10 or 12 feet, and good regular progress will hereafter be made. When it reaches its proposed additional depth of 200 feet, on the 3,200 level, the shaft should nearly or quite intersect the Hale and Norcross ore vein or

body, as on the 3,000 level it is 180 feet distant, and the general average Comstock pitch eastward has been nearly 45 degrees. The lateral drift north from cross-cut No. 2 is now in about 80 feet, and the face is in very promising vein matter. The sinking of the shaft deeper will be kept pace with by the deeper sinking of the wire, and, as they near each other, through the east inclination of the wire, the development of the ore body will be reduced to a minimum certainly, a practical demonstration—a consummation most devoutly to be wished.

CROWN POINT.—The old bonanza stopes and workings continue to yield about 350 tons per day, and the Belcher which is being worked through this mine, yields from 100 to 150 tons per day, which is worked at the Rock Point mill, just below Dayton, on the Carson river. All this ore from the three mines mentioned is of low grade, being merely the leavings or gleanings of the old high grade bonanzas which were worked out years ago.

CON. CALIFORNIA AND VIRGINIA.—During the past week about 900 tons of ore were extracted from the 1,750 level on the company account, assaying from battery samples \$26 dollars per ton. On the 1,700 level the upraise is continued at the rate of about 20 feet per week. The yield of ore from the Jones contract section, on and above the 1,300 level, is about 100 tons per day, battery samples averaging \$18 per ton.

BEST AND BELCHER.—On the 1,000 level the cross-cut west, 100 feet south of the Con. Virginia line, has been advanced 45 feet in very favorable looking and working ground.

BULLION.—Water impedes progress in the west drift on the 150 level, yet a fair degree of advancement is made, with favorable vein material in the face of the drift.

ALTA.—Good bunches of fair grade ore continue to be met with occasionally in the explorations above the 900 level, which is being saved for milling.

GOULD AND CURRY.—Cross-cut No. 1 east, next to the Savage line, on the 1,000 level, was advanced 60 feet last week, showing no new or interesting features in its face.

UNION CON.—The joint Union and Mexican lateral drift north on the 500 level was extended 65 feet last week, and is in favorable working ground.

SIERRA NEVADA.—On the 220 level the main north lateral drift was extended during the last week nearly 90 feet, the ground working very favorably.

YELLOW JACKET.—The upper workings continue their regular yield of low grade ore, with no new features to record.

OVERMAN.—Yielding about 50 tons of ore per day from the old stopes of the 226 level and above it, supplying the Vivian mill.

Cortez District.

COMING TO THE FRONT.—*Silver State*, July 7: S. Wenban, owner of the Wenban mine in Cortez District, passed here yesterday homeward bound. He has been west ordering machinery for new reduction and leaching works. He intends to build works capable of treating from 60 to 80 tons of ore daily, as there is any quantity of ore in sight in his mine. Cortez is among the oldest mining camps in Eastern Nevada. It was discovered in 1863 by prospectors, who went up the Humboldt to Gravelly Ford, and then struck south into the mountains. A small mill was ordered for the camp soon after it was discovered, but the machinery did not arrive for a year after. Freight from Sacramento was 25 cents per pound, and only brave men dared to venture out there. Mr. Wenban has stuck to the camp from the first, although at one time the mines had completely given out, and there was not a pound of ore in sight in the district. Now the mines are paying well; there are thousands of tons of ore in sight in them. Mr. Wenban is a rich man, and is going to erect large reduction works.

Columbus District.

MOUNT DIABLO.—*Candelaria True Fissure*, July 11: The north cross-cut from the west drift on the sixth level has been stopped, and a drift started on a ledge of low grade ore giving assays from \$6 to \$17 per ton. The east drift on the sixth level, is in 106 feet. The intermediate drift, between the fifth and sixth levels and west of the incline, has advanced 4 feet during the past week, and shows a narrow streak of \$40 ore. The slope above the west drift on fifth level shows a narrow ledge except in one place where there is a bunch of rich ore. The intermediate stope between the fourth and fifth levels, is showing much the same as at the date of the last report. Some ore of good grade is being taken from several places on the third level. The intermediate, east of the shaft and between the second and third levels, shows a small bunch of \$80 ore. The remainder of the mine shows no change of note. A bullion shipment of \$18,875.54 was made on the 8th inst., making a total on June account of \$42,733.32.

Eureka District.

LOCAL MINING NOTES.—*Eureka Sentinel*, July 11: The Members mine on Adams Hill made a shipment of 12 tons of ore the other day. The Phoenix mine on Ruby Hill made a shipment of 2 tons of ore on Thursday last. The Whippoorwill mine on Prospect Mountain is reported as looking and yielding well. A ton of very rich ore was brought in from Tybo the other day to the Eureka Con. furnace. Frazier & Molino sent down to the Richmond works during the past week 17 tons of very good ore. Active prospecting work is being carried on in an unusually large number of mines on Prospect Mountain. Some half dozen mines on Adams Hill made good ore shipments to the reduction works in town during the past week. The Lord Byron mine on Prospect Mountain shipped 19 tons of ore during the past few days to the Richmond works. The Silver Lick mine on Adams Hill made a shipment of 13 tons of ore to the Richmond furnaces during the past week. Considerable prospecting work is being done in the Secret Canyon mines, and in one or two cases ore is being extracted for shipment. The East Oakland mine on Prospect Mountain made a shipment of ore the past week; 17 tons were sent down to the Richmond furnaces. The Jackson mine on Prospect Mountain shipped to the Eureka Con. furnace during the past week 68½ tons of ore, which is of good quality. The Morning Star and Lone Pine mines on Adams Hill continue their shipments of ore to the Richmond works. The former shipped 22 tons, the latter 7. From the Colorado mine, on the west side of White Pine Mountain, some 16 miles west of

Hamilton, 1,800 pounds of rich ore was brought in to the Richmond works last Wednesday. From the Hamburg mine on Prospect Mountain 72 tons of ore were shipped to the Richmond reduction works during the past week. It is said that the property has in it a great deal of ore in sight. The Silver Connor mine on Prospect Mountain, which declared a dividend last Wednesday of \$1,000, continues its shipments of ore. Thirty tons were sent down to the Richmond works since Monday last. The Eureka Con. mine continues its large outputs of ore, and prospecting work is being actively carried on in numerous places in the property. The Williams pitch on the seventh level is looking very well. The depressed times in town are driving many business men who are owners of idle mining properties hereabouts to working the same. Joe Mendes' mine, the California, was idle for a long time, and it was on account of the dullness of trade with him that he resumed work in the property. As a result, he has a good-sized body of high grade ore.

Pine Grove District.

MILL RUNNING.—*Yon Co. Times*, July 10: Pine Grove, which during past years has produced \$7,000,000 in gold, is still in a quiet way running its mill, and has never yet attained a depth of 300 feet from the surface, we understand, on account of the heavy flow of water above that depth. The Moss mine and mill at Kinkead are in full blast and constantly shipping bullion in which gold largely predominates. Farringtons are working a mine in that vicinity which is paying handsomely, and for which they were recently offered \$350,000.

Pahranaagat District.

BAR 3.—*Pioche Record*, July 11: The third bar of bullion was brought in from Pahranaagat on Thursday by Eugene Howell. Its value was \$8,483 and was 95½ fine. Taking into consideration the limited milling facilities of the company, there is extra good work being done. Mr. Howell came up for the purpose of seeing if some sort of arrangements could not be made whereby the 10-stamp mill at Hiko could be leased from the Valley S. M. Co. It is to be hoped that he will succeed in securing a lease of the mill.

ARIZONA.

WALLPAC.—*Tribune*, July 11: The shipment of ore from Kingman for the month of June was 220 tons, 470 lbs, an increase of about 50 tons over the month of May. Ewing & Goshorn are having a carload of ore hauled in from the Altata mine at Chloride, which they will ship to the Argo smelter. Musser's team brought in a load of ore from the Sunlight mine at Chloride Wednesday. There is now over a carload of this ore stored in Taggart & Co.'s warehouse ready for shipment. A carload of 21,480 pounds of Golconda ore was shipped to the Pueblo smelter on the 7th. This mine is now making regular shipments of ore, and will soon be up among our largest shippers. The largest load ever hauled into Kingman by an eight-mule team was brought in Tuesday from the Primrose mine in Todd Basin by Beecher and Co.'s team, and weighed 13,467 pounds. This ore was extracted by Charles Maxson and James Jackman. One ton of this was taken to the sampling works from which they obtained about \$200. As soon as the ore is all hauled in they will ship it to Pueblo. John Barry has been appointed superintendent of the Arizona Northern Mining Company, vice H. S. Carpenter, resigned. It is understood that under Mr. Barry's superintendency considerable work will be done on the mines, and there is a strong probability of the mill starting up in about a month. If this should be done it will once more make Cerbat one of the liveliest camps in the county, and perhaps add much to the material wealth of the country. Chamberlain sampled a carload of Crescent ore Tuesday, which was taken out on the lease of Peters & Vial. The ore which Messrs. Peters & Vial have been taking out is said to be the best ever extracted from the mine. We are glad to hear it, for the boys worked for months in very unfavorable ground without a pound of ore in sight, but the Lord was on their side, and one day about six months ago they struck it rich, and have been taking out good ore ever since. Through their perseverance twenty men are now working where not one would have been had they thrown it up in disgust, as nine out of ten men would have done eight months ago.

TAILINGS.—*Prescott Courier*, July 5: The talk is that Mr. T. J. Eaman will work tailings now at the Tuscumbia mill. Mr. Chase says he has orders from Mr. Callen to make a ditch to carry water to the Antelope placers. California parties seem to want a lease on the May Bean mine, Peck district. The buried treasures of Arizona are great indeed, but it will take capital to free the gold, silver, lead, copper, etc., from their matrixes. We haven't got capital enough to even give the deposits a prospecting, much less a thorough working. Let us, then, encourage capitalists to bring or send their money here, where they are sure to be rewarded. Such very rich mines as the Tip Top, the Peck, Tiger, Lane, Black Warrior and Del Pasco, have paid from the grass roots down, but it will take means, good management and costly machinery to force pay out of the poorer classes of ores, in ten or a dozen mining districts in this county of Yavapai, as elsewhere in the Territory. Our ledge-owners can render this encouragement by not holding their prospects too high. Ask fair prices when purchasers come along; take the money and develop some other property. Were there large reduction works here development would be easy, as then the miner could take out ore and sell it on the spot. As it is, ores that will bear the expense of mining, shipment to Colorado, charges for treatment, etc., are not any too plentiful, hence the uselessness of mining for them, under existing circumstances. It is said there is no use of talking about works until we shall have railroad facilities; but, as the mines are less than 100 miles from the A. P. Railroad, well-directed capital would enable us to work scores of mines that are now idle.

COLORADO.

OPHIR NOTES.—*Cor. San Miguel Journal*, July 11: Eugene Hathaway, one of the old-timers of the San Juan, has just struck a fine body of rich gray copper and chloride ore on the New Hope, a valuable mine situated in Water Fall Basin. Tom Fipps came down from the Valley View the other day, and reported that the workings on that mine were show-

ing up splendidly. Mr. Fipps brought down an average sample of the ore he is taking out. It is rich in gray copper and sulphurets. J. P. Murry is in town from the Tidal Wave, and reports that things are booming up there. General M. J. Alkire is shipping large quantities of ore from the Suffolk, one of the most famous gold producers in this vicinity. W. R. Weeks is driving a cross-cut on the Golden Bell, and expects to cut the lead within five or ten feet. H. W. Butler will soon set four or five men to work on the Butler mine, situated near the Silver Bell. A few days ago I visited the Patterson and Trenton, two fine gold claims owned by Gillin & Douglass. These mines are situated on the west end of Yellow Mountain, and cross each other at an angle of 45 degrees. The Patterson shows some four or five feet of splendid gold quartz, which will probably run \$30 in gold. The work on the mine at present consists of a ten-foot face which was put on as assessment work for the present year, and a twenty-foot drift with a sixteen-foot shaft sunk from the bottom of it. There is a large quantity of fine gold ore displayed in the bottom of this shaft. The Trenton, which crosses the Patterson in a southwesterly direction, and is supposed to be an extension of the Fulton, shows eight feet of fine-looking quartz. The pay streak is about twenty inches in width, and will run at the lowest figure \$20 to the ton. The work on the mine consists of a ten-foot face on the vein. Both of these mines would prove a paying investment to a company with sufficient capital to put a stamp mill on the river below. As they are situated low down the mountain, a short and inexpensive tramway could be erected by which the ore could be transported to the mill and work be continued the year round.

CARBONATE BELT.—*Elk Mountain Pilot*, July 10: The country lying between Rock creek and Roaring Fork, in what is known as the Carbonate belt, is attracting attention this summer as a desirable field for prospectors. On Snow Mass and Avalanche mountains the lime formation similar to that at Aspen is found, and we would not be surprised if some startling discoveries were made there before fall. Prospectors are going in from all directions, and the best way to reach there from here is to go down Rock creek to Crystal, which is near the belt.

POVERTY GULCH.—The Black Hawk mine in Poverty Gulch is being worked by Frank Betts, one of the owners. The work on this property has been on a tunnel on the vein, which is in 115 feet and is run on the foot wall. This spring, however, Mr. Betts made a cross-cut from the breast of the tunnel to find the hanging wall, and after driving a cross-cut 16 feet came to the hanging wall, and at the same time discovered a streak of mineral 30 inches wide next to it. It is a sulphide of copper and galena that will run 60 to 80 ounces in silver and 35 per cent. lead. The Maryland lode in Dark canyon is to be worked this summer. The Richmond Co. have changed their work from that property to the Tip Top and Lady Joe, which are showing up well. McCullough & Howe are working the Florida with good success. The Domingo Co. are making arrangements to ship their ore in a few days.

CRYSTAL CITY.—The Belle of Titusville is keeping up its representation as a good property on Rock creek. The Gothic smelter has purchased 40 tons, and the mill run from one lot gave 297 ounces in silver, and from another lot 143 ounces in silver. The starting of the Gothic smelter will be a great benefit to such properties. There is quite a rush into the carbonate belt from Aspen by way of lower Rock creek and hundreds of prospectors are flocking into the mineral belt between here and Aspen. Very encouraging reports are coming in. I. H. Newman has struck a large body of ore upon a new location on the large contact down at Bull-dog creek, which shows over 4 feet of ore. The Governor Tabor is showing up splendid, and the boys are taking out some fine carbonate ore. The August Flower is coming to the front in good shape and ore getting richer.

IDAHO.

FROM LOST RIVER.—*Cor. Wood River Times*, July 11: In the way of mining there is little doing at present, but there is every indication of better times soon, for ore of a paying grade has been found in numbers of the claims, and there is a world of lower grade copper and lead ores on Lost river, which will some time make one of the greatest mining camps in the West. The present depression of business, and low prices of copper and lead, cannot last forever; and when a change comes for the better, the mines of Lost river will readily come to the front. Some very rich strikes are reported about the head of Antelope creek and near the Champagne and Lava creek districts. The ore is of high grade, and a new and promising district is being opened. The smelting furnace at Cliff will soon start up on galena ore from the Mammoth, the Alice, the Independence and other mines. At Houston though, times are rather quiet, and hard for capitalists of the single blanket order, drinks being cash on delivery, stud poker non est, and "jawnbone" no longer current at the boarding-house. Still, the outlook is quite promising for a substantial boom late in the season.

SMOKE DISTRICT.—*Wood River Times*, July 11: John Rafter who is just in from Smoky, says the mines are looking terribly well, and that the people of Hailey will be astonished at their output, as soon as the wagon road is finished. The mines show better with every foot of descent.

THE MOUNTAIN VIEW GROUP.—Willis McBride, who recently came up from Salt Lake City to superintend the work on the Mountain View group, at Bullion, is in town. He has three men stopping, with about three tons on the dump, and expects to make a first shipment of ore to Hailey within two weeks. The result of that shipment will determine the scale upon which operations will be conducted, the owners being determined to keep the expenses within the income of the claims.

THE HUMBURG MINE.—S. Graham Felsenthal, superintendent of the Humburg mine, in Lee's gulch, was in town to-day after some assay certificates. He reports the Humburg looking exceedingly well, and making regular shipments to Hailey. The latest was five tons of rich ore (the Humburg ore is always very high grade) shipped yesterday. He is working 12 men, and will increase his force as he can work men to advantage. The Humburg is owned by the same capitalists who control the Queen of the Hills, King of the Hills and other valuable mining properties in this region.

THE ORO FINO.—*Owyhee Avalanche*, July 10: Work will soon be commenced in extracting the rich ore recently found in this celebrated mine. The ore will mill nearly \$1,000 per ton, as was demonstrated last week when a clean-up was made from 30 tons as it came from the mine, which yielded \$24,689.14, or over \$800 per ton. This mine has lain idle for a number of years. It will now be worked. The ledge is large, and there are thousands of tons of free-milling ore below water level that will mill \$50 per ton. A pump will soon be placed in to relieve the mine of water, when work will be commenced in earnest.

MONTANA.

GRANITE MOUNTAIN.—*Inter-Mountain*, July 11: C. D. McClure & Co. have bonded the Granite Bell, an extension of the Granite Mountain mine, for \$50,000. Last Tuesday the Drinn Lummon mine at Marysville sent between \$45,000 and \$50,000 worth of bullion into Helena, the result of a week's run. Some fine specimens of ore from Western Montana have recently been placed on exhibition at Helena. They are from the Mattie Stone and Belle Stone mines on the Thompson river, which are owned by W. H. Anderson. The ore assays \$23 in silver and 50 per cent. in copper. The Livingstone Enterprise says that the three months' bond taken on the Homestake mine at Cooke expired last Saturday, and an extension is asked owing to the fact that the weather in the district has prevented full examination of the property. Another syndicate of Butte capitalists ask to bond the property for \$100,000 for three months, pay \$5,000 down, and put in C. W. Mather as superintendent of development work. If the terms of the present bond are not fulfilled, the owners of the property, rather than grant an extension, feel like taking up the second offer. In the new gold diggings in Welcome Gulch, Missoula county, two big nuggets were found last week, one weighing \$20 and the other a little more. Three large astras are expected to be completed and put in operation in the upper district of Emigrant Gulch, within a very few days. The Homestake mine near Helena last Wednesday sent 400 ounces of gold and silver retort into Helena valued at \$4,800. It was the result of a two weeks' run with five stamps. A large body of very rich ore was struck last week in the Iron Rod mine, in the end of the west level at the depth of 350 feet. The mine had been under water for some time past.

NEW MEXICO.

MISCELLANEOUS.—*Silver City Enterprise*, July 11: Only one carload of ore was shipped from Whitewater last month. The shipping of iron ore from Santa Rita to the Benson smelter will soon be resumed. The Carlisle mine has been temporarily closed down, pending the improvements in the concentrating machinery. As soon as this is accomplished the mine and mill will again be started up. O. R. Smythe will soon commence the shipment of Last Chance ore from the mine to the Benson smelter. There is now about 3,000 tons of ore on the dumps of the mine which will be assorted before shipment. It is likely that the McNair furnace near Brenen's mill will start up shortly. Parties are now looking around with a view to securing sufficient amounts of the right kind of ore as a basis of operation. In case they succeed in securing a sufficient quantity the smelter will fire up and be kept in constant operation. The mining machinery which left this place about three weeks ago for the Peacock M. Co. in the Mogollons was 14 days on the road. One of the wagons, upon which was loaded a heavy roller, tipped over a short distance this side of Alma. The roller was solid iron, and beyond it occasioning some delay no further damage was done.

GOLD HILL.—*Cor. Silver City Enterprise*, July 11: A three-eighths' interest in the Lone Hand was purchased by Messrs. Mitchell and Davis at private figures. Messrs. Henry, Cusenberry and Briant, the retiring partners, leave the property in good shape for working by the present owners. Clark, Derbyshire & Co. commenced work on the Grand Tower last Monday. They will for the present work but three men, but as soon as practicable will put on an additional force. Standard continues to work without interruption. In the east drift 10 feet additional has been made, showing up a 14-inch vein of rich mineral. West drift has advanced 8 feet during the week, and is also in good ore, extracting the usual quantity of mineral. No shipments will be made for some time, as the boys have ample funds on hand for all necessary purposes. Messrs. Lewis, Cottrell and others interested in the Under Dog location, have about completed arrangements for a four-months' working bond with Messrs. Caples and associates. The sum agreed upon is \$5,000 for the claim. Major James Carter, one of Lordsburg's representative men here, is curbing his will, sinking it deeper, and preparing for active work of some kind. Rumor has it that the Major contemplates erecting the first quartz mill in the district. Treasure Box is advancing steadily. The shaft is now 25 feet deep in gold ore. A galena and talc vein is coming in on the hanging wall and enlarging as depth is attained. The vein is 28 inches wide. Messrs. Howland and Hilp, should they secure any property here which promises favorably, will erect a mill immediately. There are a number of good properties here, which, however, they have failed to secure.

OREGON.

CLEANING UP.—*Jacksonville Times*, July 11: Wimer & Sons have finished cleaning up at their extensive claim near Waldo and did very well. Klippel, Denef & Co. are putting a wing-dam in Applegate, with a view of mining the bed of the river. Considerable prospecting is going on in Jackson and Josephine counties. Some good will surely result from it. I. M. Dyer, inventor of what is known as the cannon-ball quartz mill, is in Southern Oregon for the purpose of introducing his machinery. Ed. Caton and Neitz Bros. started yesterday on their second trip to Galice creek. They intend to locate both quartz and placer claims. Harvey Shepard has discovered a promising quartz ledge a short distance south of Ashland. Considerable work has already been done on it. Another mining expert has been examining the Schumpf quartz ledge in the Willow Springs district, which will no doubt prove valuable property some time. Geo. H. Chick received his amalgamating pan and fixtures last week for the Morse & Jacobs quartz mill at Henley, Cal.

Cable Railway Propulsion.

(Continued from page 35.)

power. The cables used by this company are the size of the ones used on California street (1 1/2 inch in diameter).

On McAllister street where the road crosses to Fulton street, there are four curves of about 45 degrees each, with the horizontal pulleys arranged similarly to those on Post, Polk and Larkin streets of the Sutter street road.

General Features.

These facts concerning the general features of the various roads are incidental to important questions, that of the economy in construction, maintenance and operation of the cable system of propulsion for street cars.

In order to direct an intelligent inquiry into the subject, I have divided it into three general heads:

- 1st.—Construction.
- 2d.—Maintenance.
- 3d.—Operation.

Each of these divisions, of course, have many details, but for the purpose of this paper I have made them somewhat general.

Under the head of Construction, I have placed the construction of:

- 1st.—Road bed and tube.
- 2d.—Driving machinery.
- 3d.—Gripping apparatus and cable.
- 4th.—Cars.

Under the division of maintenance I have placed:

- 1st.—Road-bed and tube.
- 2d.—Driving machinery.
- 3d.—Gripping apparatus and cable.

Under the division of operation I have placed:

- 1st.—Power for driving the cable.
- 2d.—Power for driving the cars.
- 3d.—Power for hauling passengers.

Construction.

In the construction of the road-bed and tube, it will be noticed that we have advanced from the first experiment of wood and iron to concrete and iron, with stone paving for the surface of the street and with steel for rails. Probably we have gone to the extremes in this respect as far as cost is concerned, for we have constructed the tube and the road-bed of the most lasting materials, with all the strength to support the heaviest traffic which will ever be allowed over the streets of any city, the surface being composed of materials which are best known, by experience and judgment, to resist the wear to which they may be exposed; and these materials have been used in a generous manner. The increase in economy will consist in the reduction of material to the minimum required to meet local conditions, and an exercise of careful judgment in the manner and distribution of labor in the combining and placing in position the materials of construction. The apparent cost of similar forms of construction of the road-beds and tubes of the cable roads in this city vary so much that it would be delusive to have estimates of the cost of a projected road upon the generally reported statements concerning the cost of those already built. The conditions to be observed for the street surface are that the grades of the street shall not be disturbed, or that no protuberances or depressions shall be made to interfere with traffic of teams or vehicles, and that the strength of the tube shall be sufficient to easily support the heaviest weight which may ordinarily come upon it without disturbing its shape.

In the construction of the driving machinery, some basis for consideration may be had by a comparison of the weights of the moving machinery for the roads in this city, when they are each compared with the weight of the cables which they propel and support. It may be taken for granted that the weight of supports and foundations for the moving machinery will be proportionate to the weight they have to carry.

The weights of moving machinery include the moving parts of the engines, shafts, flywheels, pulleys, sheaves and gears in the engine house; also, the deflecting sheaves, which change the direction of the moving cable, and the carrier sheaves, which support the cable in the tube along the street.

Machinery and Cables.

The approximate weights of moving machinery and cables on the various roads of San Francisco are as follows:

Name of Road.	Weight of Machinery, lbs.	Weight of cable, lbs.
Clay.....	22,000	15,400
California.....	100,000	63,000
Sutter.....	240,000	68,000
Geary.....	60,000	37,800
Union.....	80,000	30,500
Market, Valencia & Haight.....	240,000	164,412
McAllister.....	160,000	68,000

To compare the weight of moving machinery with the weight of cable, let the weight of cable be 1, then the weight of moving machinery will show as follows:

Name of Road.	Weight of machinery, lbs.	Weight of cable, lbs.
Clay.....	1	1.428
Market, Valencia & Haight.....	1	1.459
McAllister.....	1	1.47
California.....	1	1.538
Geary.....	1	1.587
Union.....	1	2.622
Sutter.....	1	3.529

These figures are somewhat suggestive. As the cost of machinery of this character is generally sold in the market by the pound, it is comparatively easy to estimate the cost of the driving machinery, and as the cost will be generally in proportion to the weight, due consideration should be given to this division of the construction account.

Construction of Grips.

In the construction of the gripping apparatus there are several considerations which have much influence on the cost: First, is the work which they are required to do; second, the conditions under which this work has to be performed; and third, the promptness with which they can be manipulated. In referring to the first condition, the work which the grip has to perform depends to a large extent on the grades over which they have to act. Allowing 20 pounds per ton for the friction of cars, then a grade of 1 in 100 or one per cent doubles the strain on the grip. The steepest grade on the roads of this city requires as much power to be developed by the engine in hauling one train over it as would be required to haul 18 trains on a level.

While the amount of work put on the grip calls for strength and power, the requirements of passengers and care for human life necessitate a construction which will admit of prompt action, and this is a very important feature in their construction.

There may be conditions existing under which it would be greater economy for the grip to break than to withstand the strain to which it is liable to be exposed, but as a general proposition it is a fallacy to assume anything of the kind. It is a condition of things which should not occur, and will not with competent engineering ability.

The first consideration is to construct the grip to meet the actual requirements as to work, promptness, ordinary wear and convenience in handling.

Cables.

In the construction of the cable much is yet to be learned. The principal condition is that it shall be sufficiently strong, after considerable wear, to withstand probable extraordinary strains; at the same time it shall not be unduly large, which adds to the weight and cost. Having an exterior surface, which is hard, so as to withstand the abrasion of the jaws of the grip, yet the flexibility of the cable shall be of such a degree that it will easily bend in passing over the sheaves and drums which change its direction.

The greater the diameter of the cable the more friction and abrasion, and power required to bend it around the sheaves which it passes. Various kinds of cables have been used on these roads—both of iron and steel, and large and small—and with various degrees of hardness. So far, the crucible steel cable has been adopted in preference to any other, possessing hardness and strength with flexibility. It is probable that changes in the lay or twist of the strands in making may effect an improvement in working.

In the construction of cars there is at present but little difference, in general views. Whether a dummy and car should be used together, or each car have a grip attached to it, is a question which will be answered differently by different local conditions, a prominent condition being all intelligent provisions for the safety of passengers in boarding and alighting from. As the larger part of accidents on these roads occur by the negligence of the injured, all means consistent with convenient access to the departure from the cars and dummies should be provided to prevent accidents.

In the maintenance of road-bed and tube, the present method of uniting concrete and iron leaves not much to be desired, the rails and paving being the only parts that require renewals during many years. The rails and slot irons should be so put down that they may be taken up and renewed without detriment to the tube or unnecessary disturbance of the materials of which the tube is constructed.

Driving Gear.

Concerning driving gear and the moving machinery connected with the cable, the engines which may be used are so well known that any style, kind, or power may be obtained to meet any condition which would arise under local circumstances. In the various arrangements for carrying and deflecting the cables we have some differences in detail, but in plan all are similar. This is a matter that has not received the consideration that its importance demands. As a large portion of the power expended is exhausted in wearing out the driving machinery and carrying and deflecting sheaves, these should have careful study that they may do the work assigned them with the greatest economy of wear and friction.

The first table shows the comparative weights of driving and carrying machinery and the cables which they carry. For the maintenance cost may not always be in proportion to the weight, but the more weighty it is made the more is the wear and the more attendance and lubrication is required, as well as the increased cost of construction.

Gripping Apparatus and Cables.

The third division under maintenance is the gripping apparatus and cables. These are mutually dependent one on the other. In the grip the wear comes on the jaws which clasp the cable, and these are now made removable, so that they can be made of the least possible weight and easily renewed, they being composed of soft cast-iron, that having with the experience so far proved the most economical of any material yet used. As the contact or connection between the grip and rope is entirely one of friction, it becomes a question of how great an abrasion or wear of the jaws of the

grip can be allowed in saving the wear of the cable without costing more than the wear of the latter. When cables are newly laid they cause a much more rapid wear of the jaws of the grip than after they have been in use some time. The cause is that when new the exterior wires composing the cable are comparatively sharp cutting edges, but they are gradually worn down or flattened by the action of the grip jaws upon them, and, in addition a coating of tar is put on the cable, which fills up the interstices, and by frequent applications the surface of the cable becomes so smooth as to resemble a bar of iron in passing rapidly along. This condition reduces the wear of the jaws and their life is increased from 200 to 400 per cent, and even more. There are two advantages in this filling of the cable with tar, one of which is to lubricate the cable to a certain extent, so that when taking hold to start a train the slip of the cable through the grip causes the train to start more gently and at the same time the wear on both grip jaws and cable. The tar alone on the cable would not effect this purpose, but by the addition of a small quantity of oil the surface of the tar is prevented from adhering to the grip or to the sheaves over which it passes. The maintenance of the cable is one of the great expenses in the operation of cable roads, or rather it has been, from several causes, first of which is the excessive wear or action upon it by the jaws of the grip, especially when a road is first built and new men have to learn the road and get experience in the handling of the grip in starting and stopping. Whatever kind of cable may be used the abrasion may be increased very largely by this action of the grip, and the experience with cables in this city has demonstrated that the life of a cable may be doubled nearly by the manner of applying the grip to the rope.

Another cause is the construction of the grip for relieving the cable from frictional contact when the car or train is standing still and the cable allowed to pass through the grip. The grips are usually so constructed that the cable is supported and guided by grooved rolls when the jaws are loosened, the rolls keeping the cable from coming in contact with the jaws. Some of them, those called "side" grips, support the cable by rolls under the cable, the jaws having a vertical movement.

The rolls being stationary, so far as vertical movement is concerned, when it is desired to start the car, the upper jaw is forced downward on to the lower jaw. In one grip in use in this city, the upper jaw extends over the friction rolls, so that the cable is forced against the rolls, and the lower jaw being shorter than the upper in this case, the lower jaw has to be at such a height that the cable will be compressed between it and the upper jaw as well as between the upper jaw and the friction rolls, so that the cable must lie partially on the lower jaw, whether compressed or when moving freely through the grip. Another grip, the rolls are placed so far apart that both upper and lower jaws are considerably shorter than the distance between the friction rolls, and the upper jaw in being forced down on to the lower jaw, carries the cable with it, and when raised, the cable travels entirely on the rolls, being free from the lower jaw. In the grip in use on the Geary street road, the grip opens at the bottom, and not having any friction rolls, the cable lies and moves on the jaws of the grip when the car is standing still. On roads where frequent stops are made, the wear of the cable increases. Other things being equal, the wear of the cable will be in proportion to the number of stops made, and its life inversely.

So far, the greatest factor in the destruction of the cable is the grip, and experience shows that skill in operating it adds to the life, and consequently economy of maintenance of the cable. The length of the jaw, which embraces the cable, is not known yet to affect the life much, but it seems that a jaw having a length of 8 to 10 diameters of the cable, is sufficient to prevent any pressure from bruising the cable, and yet will hold any load that has yet been taken up the steepest grades in this city. The practical requirements for economy of maintenance of cable, are that the grip shall be so constructed that friction rolls shall support the cable free from the jaws when it is passing through them, and the frictional contact shall be between the jaws entirely when propelling a car; that the operator of a grip shall be a man of intelligence, who can apply the grip to start the car quietly, and have the least amount of slip of the cable through the jaws. It does not follow that the one who starts the car the easiest or most gently will wear out the jaws the soonest. Experience has proved the contrary. Lastly, continuous care of the cable, in keeping it well filled with tar and properly oiled.

Operation of Cable Roads.

Under the head of operation, I have placed the power required to propel—1st, the cable; 2d, the cars; 3d, the passengers. In order that a comparison may be made, I have taken indicator diagrams from the roads in San Francisco and the table herewith shows the amount required for driving the cable alone—I mean by this, without any cars being on the road; but included is the friction of the engines and driving machinery; also the friction of the carrying and deflecting sheaves, as well as the power consumed in bending the cable around the sheaves. I have not attempted to segregate the power required for driving the cable from that required to move the engines and driving machinery without the cable on, because all this

power is in constant use, is a constant expense, and the fuel expense for driving a certain amount of cable at a certain speed, depends upon the ability of the constructing engineer to design, and a proper direction of the labor having the care of it when in operation. For the purposes of this paper I have reduced the work done on the various roads, to the number of pounds of cable moved one mile per hour with one horse power.

Name of Road.	Horse power to drive cable.....	Pounds of cable moved 1 mile per hour with 1 horse power.....	Proportionate power required for driving cable, Clay St. being 1.....
Clay.....	22.6	4,084	1.00
Sutter, estimate.....	83.6	4,538	.90
Geary, estimate.....	58.0	4,538	.90
California.....	84.0	4,743	.861
Union.....	39.0	4,788	.852
Market.....	201.0	6,221	.656
McAllister.....	60.0	9,063	.45

In this table the power for moving the cables of the Sutter street and Geary are estimated by taking the average of the work done on the Clay, California and Union street roads.

For the power to haul the cars I have allowed 20 pounds per ton at all speeds. This would give for the various roads an approximate power for each train, consisting of dummy and car, and on Market and McAllister, for the car alone:

Name of Road.	Weight of Car and Dummy.....	Horse Power for each car.....	Average No. of Cars.....	Total average power for cars.....
Clay.....	4,900	.80	12	9.60
Sutter.....	7,500	1.50	12	18.00
California.....	8,600	1.40	14	19.60
Geary.....	8,400	1.34	19	30.86
Union.....	8,600	1.42	10	14.20
Market and Haight.....	9,600	2.07	44	91.00
McAllister.....	9,600	2.07	18	37.00

The following table gives the approximate average speed of each road, the average distance that passengers are carried, the total number running hours each day, and the average horse-power required to haul 1,000 passengers on each road:

Name of Road.	Average speed.....	Average distance that passengers are carried.....	Total hours running time each day.....	Average power for each 1,000 passengers carried.....
Clay.....	6	1.5	17 1/2	.0971
Sutter.....	7 1/2	1.5	10 1/2	.361
California.....	6	1	19	.178
Geary.....	7 1/2	1	19	.177
Union.....	6	1	17 1/2	.194
Market.....	2 1/2	2 1/2	20 1/2	.412
McAllister.....	1	1	20 1/2	.163

This table shows that the power required to convey passengers by themselves is a small factor of the total power required in operating cable roads. It is assumed here that the average distance which each passenger is carried will be about half the length of the road.

The following table will give the total daily average power for operating the cable roads in this city, and also the per cent of power required for moving cable, for moving cars, and (assuming numbers) for moving passengers:

Name of Road.	Total Power.	For Cable.	For Cars.	For Passengers.
Clay.....	22.6	22.6	0	0
Sutter.....	83.6	83.6	0	0
California.....	84.0	84.0	0	0
Geary.....	58.0	58.0	0	0
Union.....	39.0	39.0	0	0
Market.....	201.0	60.0	140.0	0
McAllister.....	60.0	37.0	23.0	0
Total.....	740.0	391.2	347.0	0
Per Cent.....	100	52.8	46.9	0
Number of Passengers.....	4,000	15,000	8,000	17,000
Power per Passenger.....	1.85	2.6	2.9	2.2

These results are the average percentages for estimated average number of cars and passengers. The following table gives the average number of feet of cable for each car, except Market street, to which should be added

the cars which are switched from the McAllister street road.

Name of Road.	Number of Cars.	Feet of Cable.	Feet of Cable to each car.
Clay	7	11,000	1,571
Shutter	18	37,736	2,096
California	14	25,806	1,844
Geary	19	27,000	1,421
Union	10	21,000	2,100
Market	44	65,763	1,472
McAllister	18	27,183	1,510
Average	130	215,579	12,014
	18.5	30,797	1,716

This table shows the average distance apart of cars to be 1,716 feet for average running, but on holidays and Sundays these distances have been reduced about 45 per cent, so that cars have run 1,000 feet apart, average. I am aware that in some instances they have run much less distance than this, but at eight miles per hour the speed would be 704 feet per minute, or an interval of about 1 1/2 minute between cars, allowing for stops. Of course, if traffic demanded it, this number of cars could be kept on the road. That would be one car to each 1,000 feet of rope, and taking the totals from the table above, there would be added 85 cars; and if each car carried the average number of passengers, they would be increased 48,000, or 65 per cent, so that 65 per cent would be added to the power required for hauling the cars, which would be 231.26 + 150.51 = 381.77 for cars, and 65 per cent for passengers would be 19.26 + 12.51 = 31.77 horse power. Then the total power would be

For cables	548.2
For cars	381.77
For passengers	31.77

Of which 55 per cent would be for cable, 29 " " " " " cars, and 4 " " " " " passengers.

This is taking the average of all the roads, but if we take the road which has the least per cent. of power expended in moving the cable, the Geary street, and add cars so that they may be only 1,000 feet apart, we shall have 8 more cars—an increase of 42 per cent., and also an increase of 42 in the total power for hauling cars and passengers, thus:

For moving cable	58.	11.1
For moving cars	52.34	
For moving passengers	2.84	

Total H. P. 113.18
Of which 51 per cent would be for moving cable, 46 " " " " " cars, and 3 " " " " " passengers.

This is within the capacity of the road as it is in this case assumed, carried 14,200 passengers; while it has actually many times carried from 20,000 to 22,000 passengers in one day.

Therefore we may conclude that it is practicable to utilize 50 per cent of the total power expended in moving the cars and passengers. That this is much within the bounds will be admitted when it is seen that the comparative power expended in moving the Geary street cable is .90, and that of McAllister street is only .45, or one-half.

There is one other point which I will refer to, and that is the comparative power required over grades or level roads. While the average will remain about the same, the fluctuations will be much greater, and the consequent maximum strain on the cable will be greater over grades, and this variation of work calls for an engine that will keep a uniform speed under more severe conditions than usually obtain even in rolling mills, for if the speed of the engine in the mills varies somewhat, human comfort is not affected by it; but in cars moved by cable, any variation in the speed of the engine may be easily detected by the surging movement which is given to the car. There is no difficulty in providing engines that will run at a uniform speed under all the changes or variation of work that may come upon it.

There are other points of importance which might be referred to in this paper, but it has already extended beyond the primary intention. Our future experience will be guided and aided by the past, and the divisions of the subjects which are but little understood at present, will become as familiar as household words.

TELEGRAPHING FROM MOVING TRAINS.—One way in which messages are received or sent from moving trains is by induction. A wire is buried in the center of the track. Operating instruments are then placed in the car in connection with an induction coil formed by wrapping copper wires lengthwise through the car, and passing them underneath through an iron pipe. The pipe is suspended from the car about six inches above the ground and directly over the buried wire. It was stated that the entire practicability of this plan has been demonstrated. Nearly a year ago 12 miles of the Harlem railroad was equipped with this system, and the result of the experiments has in every way been satisfactory to the inventors. It was found that the weather had little effect on the working of the system, and even with half a foot of snow on the ground no difficulty was found in carrying on communication between a moving train and a telegraph office.

USEFUL INFORMATION.

A Safe Without a Door.

A spherical safe without a door is the latest novelty in that line. It is very different in construction from other safes, being composed of two spheres, one within the other. The inner sphere revolves within the outer, which is simply a massive protecting case. As the outer shell is only two-thirds of a complete sphere a considerable opening is left in front, and into this is fitted from the inside a part of the smaller sphere, which is the safe proper. This inner sphere revolves upon two pintles. It can also be moved back and fourth so that its outside diameter corresponds exactly to the inside diameter of the outer shell, the joint being formed by a series of steps, when brought forward it makes a very tight fit.

The safe is solid metal throughout, having only one thickness of material, and the shell consists of but three pieces, the back and front, composing the outside, and a piece comprising the principal part of the inner sphere. The outside is made in two parts, so that the safe proper, which is larger than the opening, can be placed within it. The parts are screwed together, after the manner of a hose coupling, and locked in position by bolts from the inside. The thread, of course, is the entire circumference of the shell, and is probably the largest ever cut. The jointing surfaces, at and near the outside, are too hard to be cut by a steel tool, and are ground so accurately that there is absolutely no space between them. The safe section is one piece of metal, four to four and one-half inches thick, slightly flattened at the front. The safe is the invention of and is manufactured by Wm. Corliss, the famous builder of steam engines.

He claims that they are burglar proof for the reason that they cannot be forced and robbed of their contents in the space of time that burglars are supposed to have, and by use of implements possible for them to employ. These very strong boxes weigh 10,000 pounds, and are so much appreciated in the home of the inventor, Providence, that 25 banks and firms in that city use them.

HOW INSECT POWDER KILLS.—Regarding the method of action of this powder upon its victims, the fact should be borne in mind that the lungs or breathing apparatus of the insect are very different to those of the vertebrate animal. Instead of lungs, as we have, set apart in one portion of the frame, for the definite object of supplying oxygen to the blood after the latter has become in need of it, the insect has a central tube, connected with the air by a row of orifices on each side of its body, from which smaller channels radiate to every part of its circulation. The animal lung demands two systems, as it were, of circulation—the arterial and the venous. The insect has but a single circulation, and the whole of its blood is being constantly and fully brought into contact with fresh supplies of air. Hence the instant and powerful effect of any toxic substances with which the air may be impregnated. Thus an insect may be almost instantly killed by the vapor of chloroform, or ether, or prussic acid. These facts are powerful arguments for the theory that it is the volatile constituents of insect powder which are fatal, and not the actual contact, necessarily, of its particles.

ARTIFICIAL CREAM.—Cheap artificial cheese is now largely made from oleomargarine. Oleomargarine, which forms the basis of butterine, is a clarified oil obtained from beef suet; and, although its somewhat tallowy taste is objectionable, it is an animal product of considerable nutritive value. In the "creameries" of the United States the cream is so effectually withdrawn from milk as to leave the latter too poor for conversion into a salable skimmed milk cheese. The skimmed milk is artificially charged with fat in the form of oleomargarine. An emulsion of skimmed milk and oleomargarine is made, and this artificial cream is added to the skimmed milk. This fluid, thus enriched with fat, can be made to yield cheese of fair quality. An oleomargarine cheese will not "ripen" well, oleomargarine lacking in a great measure those soluble fats, the composition of which feeds the green and red mould of old cheese, and gives it its peculiar piquancy.

TO MAKE FLY POISON.—The fly poison so generally used is made as follows: Syrup of quassia, 100 parts; alcohol, 25 parts; water, 300 parts. For use, moisten a piece of cloth or filtering paper in the mixture; place a little of the mixture in a plate and with it the piece of saturated paper or cloth.

The syrup of quassia can be had at the druggist's. It is made by macerating, during 24 hours, 100 parts of quassia wood with 500 parts of water, then boil for half an hour. Set aside for 24 hours and press. Mix the liquid with 15 parts of molasses, and evaporate to 20 parts. A weaker decoction of quassia does not kill the flies.

PAPER SLIPPERS are the latest form in which paper is introduced in new inventions. An Englishman has patented a system of manufacturing slippers, sandals, and other coverings for the feet out of paper. Paper pulp, or papier mache, is employed for the upper, which is moulded to the desired form and size, and a sole is provided of paper or pasteboard, leather

board, or other suitable paper material, which is united to the upper by means of cement, glue or other adhesive material. The upper is creased, embossed or perforated at the instep and sides, which renders them somewhat pliable, and prevents their cracking while in use.

PROGRESS OF WATER GAS.—The gas companies that 10 years ago denounced water gas as highly dangerous to the public, and supported their absurd assertions by the reports of some of our well-known "professors," in order that they might defeat the introduction and competition of cheap water-gas, having in a great measure succeeded in this object, quietly themselves commenced the manufacture and distribution of the "deadly water-gas," that they had so long denounced. There are few people, probably, that know the progress made in the introduction of water-gas in the past 10 years. Most of the Pennsylvania cities, Baltimore, New York and several of our other large Eastern cities are now lighted to a great extent with an enriched water-gas; but the present enormous consumption will sink into insignificance when the cheap unenriched water gas is distributed for fuel. The success of the new incandescent fuel gas-light, to which we have already made references in these columns, promises to bring about this change soon. We may then expect to see our gas costing consumers say 50 cents per 1,000 feet, used generally for fuel, and at the same time furnishing a much better light than we now have. Of all investments now before the public, gas-making appears to be the most profitable and the least liable to loss.—*Eng. and Min. Jour.*

AN AIR BRUSH FOR PHOTOGRAPHERS.—The attention of photographers has lately been called to an ingenious device known as the air brush. A little holder is charged with India ink, and by a bellows operated with a foot pedal after the manner of a sewing machine, the fluid is blown upon a faintly outlined portrait the result giving a picture superior in many respects to the best crayon drawing. A life size portrait may, according to this method, be produced in a few hours, whereas formerly by the use of the stump and pencil as many weeks were required.

THE JUICE OF THE TOMATO PLANT DESTRUCTIVE TO CATERPILLARS.—A correspondent of the *Fruit Recorder* says he has boiled leaves and stems of tomato plants until the juice is all extracted, and find the liquor deadly to caterpillars, lice, and many other enemies to vegetation. It does not injure the growth of plants, and the odor remains a long time to disgust insect marauders.

GOOD HEALTH.

Baths and Bathing.

The utility of bathing frequently cannot be doubted. It would be difficult to convey in a limited space a sufficiently complete idea of this most powerful means of preserving and restoring health. No wonder the ancients, and especially the Romans, carried the practice to such an extent. Why it should have fallen into disuse in modern times it is difficult to determine, and the more so, as it is such an agreeable remedy and preventive of disease, by lessening and regulating the heat of the body and the circulation of blood, tranquilizing the irritability of the nervous system, and especially of cleansing the skin, thereby removing a primary source of disease. It invigorates the whole system, and to an increase of bodily strength it adds exhilaration and a delightful serenity and cheerfulness of mind.

We make no attempt to establish a dogmatic system to persuade readers that they will find in water a universal remedy, acting in some mysterious manner. We have only to refer to the elementary teachings of physiology for a knowledge of the uses of water in the animal economy.

It enters the blood vessels, both by being absorbed from the mucous membrane lining the digestive passages when taken as a drink, and by permeating the skin in baths. Happily there is no dissension to the fact of the great benefit arising from the use of water in the form of baths. This is a point on which doctors do not disagree. It cannot be doubted that a regular and judicious use of baths is a preventive of many diseases; that they have cured many diseases is well known, and it is highly probable that many forms of serious and distressing sickness, with which many persons are afflicted during a long course of years would be almost unknown among us, and the pain from incurable diseases greatly mitigated were baths in general use. There would be less suffering, more cheerfulness and vivacity, and greater length of days, and a more complete enjoyment of existence.

All medical science tends to establish this proposition, that whatever the cause of disease may be, the most effective preventives are those which regard the body only, irrespective of the external circumstances of climate, atmosphere, vicissitudes, miasma localities, contagion, etc.; and if the body is properly guarded, the abodes of the most frightful diseases may be visited with irregular impunity. It is because the body is neglected that it does not better resist the morbid actions of external agents, and becomes diseased. Like a complicated machine,

which, if exposed, soon becomes clogged with dust, and thus compelled to discontinue its movements unless constantly guarded against impurities, the human body needs constant attention—much more than a mere artificial machine—since of all organized structures it is by far the most complicated.—*Exchange.*

OVERWORKED BRAINS.—The nearest thing to an indication that the brain has been working rather more than is good for it is the persistence in the mind, during the period of rest, of the thoughts which have engaged it during its condition of activity. After a good spell of hard work the brain-worker is often tormented by finding it difficult, all at once, to turn off the steam. His work-day thoughts will intrude themselves, in spite of every effort to keep them out. Each worker has usually a way of his own of endeavoring to get quit of these unwelcome guests. Thackeray generally succeeded in exercising the creatures whom he had been calling into existence by the simple expedient of turning over the leaves of a dictionary. A great lawyer was in the habit, in similar circumstances, of plunging into a cold bath, and averred that a person never takes out of cold water the same ideas that he took into it. Perhaps the best mental corrective of this condition is to employ the mind for a short time in a direction most contrasted to that in which it has been overworked. In this way a mathematician might find advantage in unbending his mind on a page or two of a novel while the novelist could chase away the phantoms which haunt him by dipping into a discussion on the "quantification of the predicate." The cure, in fact, must be sought for on a principle the very opposite to that of the famous homoeopathic doctrine of "similars."—*Chambers' Journal.*

CANCER AND EPITHELIOMA.—Cancers vary in structure, depending much upon the part attacked by the disease. There are different kinds of epithelioma. The cancer variety is deemed malignant; other forms may be painful, but not dangerous; they are called *benign*, although they may grow and become very inconvenient. Epithelioma, as its name implies, affects the epithelial tissue which lines the mouth and the whole intestinal canal. The case of General Grant is regarded as an epithelioma of a malignant type. Strictly, a cancer is always malignant; it may be hard or soft; in the latter case it is deemed more active, therefore sooner accomplishes its dread work. A local cancer, one that is due to injury or irritation in a particular part of the body, may be cured if treated early in its existence. Cancer due to hereditary taint is practically incurable. A tumor may appear in one locality and by judicious treatment be removed, and apparently cured; but the disease is likely to appear somewhere else before long. Tumors of one kind or another are very common, and often frighten people, who think they are cancerous. Comparatively few tumors are really cancerous. On their first appearance, especially if they be soft and have rapid growth, they should be examined. Habit and nervous conditions have more to do with cancerous disease than most of us suspect.—*Science of Health.*

WRINKLES.—Wrinkles have two causes: one is age, and the other is care, sorrow, low spirits, etc. To cure the latter you must remove the cause. The wrinkles which come from old age cannot be entirely prevented, but they may be palliated by cheerfulness and good habits of diet, exercise, fresh air, plenty of sleep, etc. As for the preference for hot or cold water for the skin, we may say both are useful. Hot water softens and cleanses the skin and promotes the circulation of the capillaries; cold water, with a friction, fortifies it, so after a hot bath a dash of cold water is very useful. Hard water is injurious. Soap should not be used on the face, except in rare cases, as it injures the skin more or less. Oiling occasionally is useful. The best cosmetic for the face is out-of-door exercise.

A SANDBAG FOR THE SICK ROOM.—One of the most convenient articles to be used in the sick room is a sandbag. Get some clean, fine sand; dry it thoroughly in a kettle on the stove. Make a bag, about 8 inches square, of flannel, fill it with the dry sand, sew the opening carefully together and cover the bag with cotton or linen. This will prevent the sand from sifting out, and will also enable you to beat the bag quickly by placing it in the oven or even on top of the stove. After once using this you will never again attempt to warm the feet or hands of a sick person with a bottle of hot water or a brick. The sand holds the heat a long time; and the bag can be tucked up to the back without hurting the invalid. It is a good plan to make two or three of the bags and keep them on hand, ready for use at any time when needed.

THE PLEASANT ODOR OF CEDAR, according to Mr. B. Lewis, appears to be as persistent as the wood itself. Slivers taken from white cedar stumps found 12 feet under water at low tide, near the Narrows entrance to New York harbor, had the odor of newly-grown wood, and a piece not twice the size of one's finger perceptibly scented a drawer for more than a year. "It is certain," says Mr. Lewis, "that the coast where the trees, of which these are the stumps, grew, has since undergone a depression of eighteen to twenty feet, an event which may have occupied as many centuries."

TABLE OF CONTENTS.

EDITORIALS.—The California Street Road, 38. Cable Railway Propulsion, 34-39. Passing Events: A Quarter of a Century, Our Cable Road Edition, Coal at San Francisco, El Dorado County Mines, 40. The Clay Street Road, 41. Freeing Cable Roads from Snow and Ice; the Wingard System of Street Railroads; Cable Roads and Real Estate, 42. Crossing Cables, 43. Cable Roads in the East, 44. The Market Street Cable Road, 45-49. The Isaac's Method of Building Cable Road-beds, 49. The Park and Ocean Railroad; The Cable System Abroad, 50. The Sutter Street Railroad; New York's Mistake; The Presidio and Ferris Cable Road; The Geary Street Cable Road, 51. The Rasmussen System; Taylor's Endless Chain Grip for Cable Roads; Peterson's Safety Guards for Cars, 52. The Chicago Cable Road; The National Cable Railway Co.; The New Road in Los Angeles, 54.

ILLUSTRATIONS.—The California Street Cable Railway, San Francisco, Cal., 38. View on the Clay Street Hill Railroad; Passenger Car and Dummy, with Gripping Attachment, Wire Rope and Side Section of Tube, 41. The Hallidie Cable Grip; Isometrical View of Road-bed, with Grip and Part of Shank, 42. Section Through Dummy and Road-bed, Showing Cable and Gripping Attachment, 43. Cable Cars for Proposed Road in New York, 44. Ferry Terminals, Showing Cars of Three Lines in Course of Arriving, Turning and Departing, 45. Main Line Engine House and Machine Shop; Section of Angle Sheaves, Drivers and Tension Apparatus, 46. Root's Patent Forward Truck, with Grip, Brake, Lever and Fender; Patent Rear Truck, Showing Track Brake, 47. Root's Patent Grip; Section of Road-bed, Showing Foundation Piers, Tube, Patent Car, etc., 48. J. D. Isaac's Patent Cable Road-bed, 49. Profiles of Lines of Cable Railways in San Francisco, 50. Cars and Dummies of the Sutter Street Cable Road, 51. Taylor's Endless Chain Grip for Railroads and Other Purposes, Fig. 1—Peterson's Rotary Safety Guard for Street Cars; Fig. 2—Peterson's Guard for Cable Dummies, 52. Dummy and Car on the Chicago Cable Railroad, 54. Car and Dummy of the Geary Street Cable Railroad, 50.

USEFUL INFORMATION.—A Safe Without a Door; How Insect Powder Kills; Artificial Cream; To Make Fly Poison; Paper Slippers; Progress of Water Gas; An Air Brush for Photographers; The Juice of the Tomato Plant Destructive to Caterpillars, 39.

GOOD HEALTH.—Baths and Bathing; Overworked Brains; Cancer and Epithelioma; Wrinkles; A Sanbag for the Sick Room; Odor of Cedar, 39.

MECHANICAL PROGRESS.—An Interesting and Important Discovery; An Improved Converter; Dies for Making Hatchets; Dyeing, 56.

SCIENTIFIC PROGRESS.—Life Everywhere; Glacial Action; The Natural Gas Wells of Northwestern Ohio; The Sun and Moon; To Avoid Electric Induction; A Photograph of Lightning; Birth of a Volcano; Curious Effect of Asphalt Pavements; Observations of Solar Protuberances; Cocaine and Fish, 53.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 53-57.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 61.

Passing Events.

Most of our space this week is occupied with descriptions of the cable railway system, and the various cable roads in operation. There is much of interest to engineers in the details, and the public generally will appreciate being able to understand much that is not very plain to the casual passenger.

Lead miners will be pleased to find that lead is beginning to rise from the depressed state it has been in so long. It has reached \$4 per hundred, and it is thought the price will go higher. The 8000 tons of the Richmond mine, now held by injunction, is thought to have

something to do with this advance, as it cannot be sold for a long time.

They have cut down the miners' wages at Quijotoa, Arizona, from the \$4 per day figure, and it is stated that that price will not be paid much longer in the camps where it still prevails.

The mining situation is unchanged. Some few mines are producing bullion which have not done so for some time, notably the Hale & Norcross, Con. Virginia and California, Grand Prize and Blue Jacket, all in Nevada. Work is progressing steadily everywhere, with little change to note.

A Quarter of a Century.

The MINING AND SCIENTIFIC PRESS is now a quarter of a century old. Established in 1860, it early took standing as an authority on mining matters, and has maintained its position ever since. When the paper was first published the precious metal mining field of the United States was of comparatively small dimensions, and there was not one man engaged in mining where there are one hundred now. The principal mining being done was in California and Nevada. The mines in Idaho and Montana were in limited fields, and Utah, Colorado, Wyoming, Arizona and New Mexico were scarcely considered. In Oregon and Washington Territory very little mining was going on. The main search was still for surface diggings, and the possibilities of doing much in silver, lead and copper were only beginning to be thought of. Since then the PRESS has seen the mining area gradually widen in every direction; cities and towns depending on the mining industry have grown up on all sides, some to live and thrive, and others to decay as the mines were worked out. It has seen the beginning and end of hundreds of "excitements and booms," seen the era of speculation in stocks grow to immense proportions and dwindle to almost nothing, and lived to see its predictions fulfilled that legitimate and steady work on the mines themselves was best for the owners and the people.

It has passed through the experiences of times of depression and activity, seen the prospectors and miners flocking by the thousands to new fields afar off, only to return in time to the old camps where they knew hard work would bring them out in the end.

It has seen hundreds of metallurgical processes come to the front, be tested and pass out of sight, and has seen the many which have proved successful from their inception to their general adoption. The errors pointed out and the information given on these and kindred subjects have saved millions of dollars to the coast.

The PRESS has recorded from week to week the gradual progress of development in the prominent mines of the coast, and kept faithful record also of the discovery and growth of the various mining camps. During all these years it has been the earnest and steadfast advocate of the progressive industrial classes and of the interests to which it has been and is devoted.

It is no small thing in a comparatively new region such as this coast, where there has been so much that was ephemeral, for a technical journal to attain an age of 25 years. Not a single regular issue of the paper has been deferred since its present publishers took possession, over 21 years ago, and in no case have the publishers been charged with lack of faith in any particular. Its present standing has been reached by steady work and regular yearly advance and progress.

We have with us now on our subscription lists some who were among our early patrons. We have in our advertising columns names that have been there constantly from 15 to 20 years, a token of appreciation of results that speaks for itself more than words of self-praise.

We have endeavored in all these years, while pursuing a conservative course, to bring before our readers all that would interest them in their special lines, taking care at the same time not to bring into prominence schemes, methods or appliances of a doubtful nature. We have always considered this the best course and shall continue it.

Popular science, mechanics and local industries have occupied much of our space and have always been a feature of the paper. With the advance of industrial progress in late years we have kept pace, and our readers have had the experience of extensive reading and com-

pilation in this branch. It is a matter of pride to the publishers and proprietors of the MINING AND SCIENTIFIC PRESS that its record is clear and that it has never been mixed up in any way in furthering the designs of mining speculators whose only intention was to foist upon the public, property which was not what represented. The reputation of this paper in this regard is well-known and established.

Those who have been our readers long will notice that this week our usual mining miscellany is curtailed to give space to descriptions of those triumphs of modern engineering—the cable roads. To those into whose hands this number may fall, who are unacquainted with its usual make-up, it may be said that in the regular editions a much larger proportion of the contents is usually devoted to the mining interests. Those who are disposed to support a faithful mining advocate may rest assured that the MINING AND SCIENTIFIC PRESS will be continued with unrelaxed energies, and that the years of experience of its editors and publishers will enable them to provide what is wanted. Its field of usefulness is larger now than ever.

Our Cable Road Edition.

Our space this week is mainly devoted to consideration of cable railroads. Roads on this plan were first built in this city, and there are more of them here now than anywhere else, though the system is gradually being introduced in other places. Elsewhere they have not been quite so successful as in San Francisco, owing to the fact that the projectors have endeavored to evade the patents and have experimented with all sorts of new plans and so-called improvements. The result of having disregarded the experience gained in San Francisco much useless expense has been entailed.

We have six main-line cable roads in this city and several branches. All these roads are in daily operation. They are always preferred to the horse-cars by the public. On most routes they go where horse-cars could not be run, and then equal speed up or down hill is of course a very great advantage. Once in operation, these roads are run much more cheaply than when operated by horses, although the first cost of the road is of course greater with the cable system.

These roads, without exception, have been profitable from the beginning, no cable road yet built having been a losing operation. In every instance, however, the stock is worth from twenty-five to sixty per cent more than its cost, which is a very important point for capitalists. The experience gained in this city is being utilized elsewhere, as a matter of course. Most of the patents granted on improvements on cable roads have been taken out by San Francisco inventors. Here the plan was worked out to practical results, until now San Francisco has the reputation of having the most complete, convenient and speedy street-car transportation system in the world.

Coal at San Francisco.

We received in this city during the month of June, 71,144 tons of coal. The coal receipts at this port are constantly increasing. It is brought here in ships and steamers from various places. We receive coal from Carbon Hill, Coos Bay, Cedar River, Green River, Renton, South Prairie, Seattle, Nauaimo, Wellington, and we also import Anthracite, Australian, English, Scotch and Welsh coals.

The receipts of coal for the first half of this year amount to 515,658 tons, against 439,311 tons during the first half of 1884, showing an increase of 76,357 tons in 1885. Of our receipts this year 317,465 tons, or over three-fifths, have come from our coast collieries. During the first six months of last year our California collieries produced 38,118 tons, but this year they are shut down.

The increased importation of coal for the past half year, over a similar period of last year, 76,357 tons, is a very gratifying circumstance, being a marked evidence of an increased population, and an enlargement of manufactures. The principal factors in supplying our market with coal are our coast collieries, this being the first year where it can be said that the output of British Columbia and Washington Territory can be increased to such an extent as to make California independent of foreign supplies. Still, prices never reach so low a standard as to entirely exclude foreign importations, hence our colliery managers must restrict their output to maintain covering rates. This policy, for the moment, is not being adopted, as some new companies are introducing their products, and in bidding for public favor and soliciting trade heretofore held by others, they disregard entirely the cost of their importations. This cannot last long. Importers of foreign grades are suffering severely from this cutting of prices, and are left no alternative but to meet the market with serious losses. Foreign shipping interests are suffering from light freights inward on coal, and losing

rates outward on grain. The stock of coal on hand is somewhat greater than at this time last year, the railroad companies carrying very large supplies.

El Dorado County Mines.

[From our Traveling Representative.]

Mining matters in El Dorado county are very quiet at present. More or less prospecting is continually going on with highly satisfactory results in many instances. In a number of districts old mines that have a rich "has been" record are being worked again, and by judicious economy are showing up in good shape. Contracts for development and a general revival of work on numerous mines is the order of things in this rich but sadly neglected county. Quartz mining—that is, legitimate quartz mining—is in its infancy, so to speak, in El Dorado. It is a mistaken idea that hundreds of old miners in El Dorado county would, if there was anything worth having, have had it ere this. The simple facts of the case are about as follows: The county is full of old-time miners—men whose first pick was struck in its placers. These men and a majority of recent newcomers are away behind the times in their knowledge of modern quartz mining and in many cases are "has been" 49ers in experience and ambition. As a rule, California placer and seam-belt miners do not take to quartz; hence, much ground that would open up into quartz bonanzas is overlooked or purposely neglected by those men.

Phenomenal Advantages.

El Dorado county possesses more advantages that tend to lighten the cost of labor of the prospector than any one county in the State. Water ditches cover her every divide; timber is abundant. Good roads traverse the entire county. Quartz mills—the monuments of early extravagant mining companies—dot her hill-sides. Croppings and float indicate the existence of and assist the intelligent to locate the vein. The climate is unequalled, and owing to the year around water supply, work need not stop when once started. What the county needs more than any one thing else is men educated to quartz mining—men who are modern and progressive in their ideas and who combine the scientific with the practical. Practical, intelligent mining here, even with limited capital, will prove tenfold as remunerative as the more sand-than-sense methods would do even in a better mineral field. The past records of many districts are anything but savory to mine speculators. This, however, is merely history repeating itself in mines and mining, for what camp or district that ever amounted to anything has a record all the way through that is enviable? Mining men who visit any county for the purpose of looking up mining property to invest in should hear every man's story and believe nobody until he has seen and satisfied himself as to the property he intends buying.

Chances for Good Investments.

Any man familiar with quartz mining and having even a limited capital will find El Dorado county a most desirable field to obtain paying and business propositions in quartz mines. While there are a great many patented claims, and hundreds held by relocating and assessment work, yet there are many good chances for the location of mines; especially is this the case in quartz mining. The "stick-to-'em" qualities of this placer and seam-belt miners leave the quartz man almost a free field. Now that mining matters are listless and dull, money tight and new fields attracting the ever-changing and notional miner elsewhere, the present time is a good one to investigate the merits of El Dorado's mines. The opportunity now presenting itself for the purchase of good mining property at reasonable and, in many cases, "dirt cheap" prices, will seldom, if ever be had again. Of course, there are many worthless diggings, and "tenderfeet" mining sharps and their representatives will be "took in" and done for in every instance, as heretofore. All the reform in mines and mining matters will not kill all "wild cat" rackets, hence the fact that a few fools and their money parts here occasionally should not deter business men from looking into real mineral merit and paying investments. Next week I will send you a sketch of a few mining districts. The capitalist desiring to visit El Dorado should either come via Sacramento and Auburn to Greenwood and Georgetown or via Shingle Springs to Placerville, as from these places he can reach the principal mining districts of the county. The trip is only one day from San Francisco, and the cost is too trifling to mention.

F. W. S.

"THANKS."—We are greatly indebted to Mr. A. S. Hallidie for assistance rendered in preparing some of the matter concerning cable railroads, in this edition of the PRESS. He has very courteously answered many questions and placed certain data in his possession at our disposal. Mr. James Gamble has favored us in a similar manner. Mr. W. W. Hanscom and Mr. H. S. Smith have also assisted us materially, as have other gentlemen well informed on the subject of cable railroads. We feel under great obligations to them all.

The Clay Street Road.

The Clay street road in this city was the first cable road built, and it was upon it that Mr. A. S. Hallidie first submitted his invention to a practical trial. It ran successfully from the first, answering all requirements, and has been considerably extended from its original route. A description of the Hallidie system of cable railroads, now in use by the Clay Street Company, will best explain the *modus operandi*.

Clay street is a central street in the city of San Francisco, and for a number of blocks near

The general arrangement of the system in use by the Clay Street Hill Railroad is as follows: An endless steel wire rope, three inches in circumference, 11,000 feet long, is stretched the whole distance, lying in iron tubes, supported every 39 feet on 11 inch sheaves. This rope is supported at every change of angle at the lower crossings on sheaves four feet in diameter, passing around a horizontal sheave eight feet in diameter at the lower end of the line, and at the engine house around two angle sheaves, each eight feet in diameter, which lead the rope on the grip pulleys, also eight feet in diameter, which are driven by one 14x28 engine. The steam is furnished by one boiler, 16

feet and the traveling rope, is made by means of this gripping attachment, which is herein after described. The cars are made to seat 14 passengers, and the dummy 16, but not seldom as many as 44 have ridden in the car and 26 on the dummy—70 in all; and the roads with broad gauge larger cars and more even grades have, in one load on car and dummy, carried as many as 100 passengers. It is true they were crowded, but this is always the case on holidays. The traction car, or "dummy," with the gripping attachment, is attached to the passenger car firmly, so that there can be no danger of accident. The passenger car is amply provided with brakes. In addition to the usual

wards, and the lower or supporting pulley, also the gripping device attached to the dummy and to the rope.

Fig. 2 is a transverse section through the dummy and road-bed; the tube, supporting pulley, rope and gripping device are shown, and the general mode of construction of the same.

Fig. 3 is an isometrical view of the road-bed—a portion of the tube being removed to show the gripping device attached to the rope; the lower end of the shank is only shown (it is broken off in the drawing), being sufficient for the purpose; the construction of the tube and tube frames is clearly shown, and the appearance of the rails and slot and surface of the street when paved,

VIEW ON THE CLAY STREET HILL RAILROAD.

the lower terminus of the road is very densely populated. The street is only 40 feet wide from house to house, and between the sidewalks is occupied by two lines of gas pipe, one line of water pipe, a street sewer, and at the cross streets by water cisterns.

The lower terminus of the road is at the intersection of Kearny and Clay streets. The summit of the hill is 307 feet above Kearny

feet x 54 inches, using 3,700 pounds of coal per day. They have also duplicate engine and boiler, which are held in reserve.

The grip pulleys being furnished at their circumference with jaws that grip and release the rope automatically, by the pressure of the rope in the jaws, prevents the rope from slipping; and being set in motion by the engine, actuates the endless rope, while traveling up one tube

car brake, there is another attachment operated in the same manner as ordinary brakes, which forces a broad band of wood down on each track immediately under the car. This arrangement is shown in Fig. 1. Strong iron drags are provided, so that if an accident should occur in going up the hill, they will immediately catch in the street, and prevent the car from going backwards. When it is neces-

Fig. 4 shows the gripping attachment used by the Clay Street Railroad Company and the Presidio and Ferries Railroad Company. A vertical slide works in a standard, and is moved up and down by a screw and hand-wheel. This screw is shown on the cut of dummy, Fig. 2. The small upper screw going down through the large screw operates it. At the lower end of this slide is a

PASSENGER CAR AND DUMMY,

WITH GRIPPING ATTACHMENT, WIRE ROPE AND SIDE SECTION OF TUBE

Fig. 1.

street. The incline on Clay street has a double track, and is 5,197 feet long; the rope runs into the engine house at Leavenworth street. The ascending grades are as follows: From Kearny to Dupont, 45 feet; from Dupont to Stockton, 45 feet; from Stockton to Powell, 62 feet; from Powell to Mason, 42 feet; from Mason to Taylor, 48 feet; from Taylor to Jones, 67 feet. Then the grade descends, as follows: Jones to Leavenworth, 15 feet; Leavenworth to Hyde, 50 feet; Hyde to Larkin, 50 feet; Larkin to Polk, 45 feet; and then an ascent of 15 feet from Polk street to Van Ness avenue. The distance between each street is 412½ feet. Clay street runs at right angles to the above streets, which have widths varying from 45 feet to 68 feet 9 inches. All the street crossings are level. The steepest grade is 1 in 6.15.

and down the other.

In addition to the sheaves that support the rope in the tubes, at the upper side of each crossing where the incline makes an angle upwards, there are sheaves in the tubes that keep the rope down and from striking the upper part of the tube.

There is an opening in the upper side of the tube. This opening runs the entire length of each tube, forming a long slot three-fourths of an inch aside. This slot is not immediately over the center of the tube, but on one side, to keep sand and dirt from falling on the rope, to clear the upper sheaves, and enable the foot of the gripping attachment to pass by and under the upper sheaves, and over the lower sheaves in the tube.

The connection between the cars on the

sary to back down hill, these drags are raised up out of the way by the conductor.

The "dummy" is also provided with powerful brakes. The "dummy" and car are connected with a suitable coupling, so that the weight of the car going down comes on the rope and is utilized to draw up the other cars on the other track. The brakes are not usually employed when coming down except when it is necessary to stop, as the car runs down with the same speed as the rope as long as the gripping attachment is in connection with the rope.

By referring to the engravings, the system will be more clearly understood. Fig. 1 is a side view of road and car and dummy; the tube is in longitudinal section and shows the arrangement of the rope; the upper pulleys for keeping the rope down where the grade changes up-

wedge-shaped block. The wedge actuates two jaws horizontally, which open and close according to the direction in which the slide is moved, closing when the slide is moved upwards. These jaws have pieces of soft cast iron placed in them, which are easily removed when worn out. These pieces of iron are of proper shape and size inside to grip the rope when they are closed over it.

On both sides of these jaws, and attached to them, are two small sheaves. These sheaves are held by means of rubber cushions, sufficiently in advance of the jaws to keep the rope off from the jaws, and at the same time to lead the rope fairly between them, allowing it to travel freely between the jaws when they are separated, without touching them. When it is required to grip the rope, this slide is drawn up

by means of the small screw before described, and the wedge at the lower end closes the jaws over the rope, at the same time forcing back the small guide sheaves on to the rubber springs. The standard containing the slide, etc., is enclosed and retained in an iron bracket, shown on the dummy (Fig. 2), and raised and lowered bodily through an opening in the tube from above the surface of the street to the rope in the tube by means of a screw and nut, with hand-wheel attached. The iron bracket is secured to a traction car, called a dummy, as shown in Fig. 1 and 2.

The dummy is coupled to the passenger cars at the bottom of the incline, and uncoupled at the top, and *vice versa*. Horses can then be coupled to the cars if desired. As before stated, the rope is constantly in motion, running between sheaves placed in the tube. The slot of the tube is on one side of a vertical line drawn through the center of the tube, and referring to the cuts it will be seen that the foot of the gripping attachment projects on one side, giving it an L shape, enabling the jaws to pass under and over the rope sheaves in the tube. In order to stop the car, the jaws of the gripping attachment are opened slightly; when they release the rope, the guide sheaves take it, and the car stops.

The shank of the standard containing the slide, which works in the slot of the tube, is one-half of an inch thick and $7\frac{1}{2}$ inches wide, there being one-eighth play on each side. All the essential parts of the gripping attachment are made of steel.

The rope runs $17\frac{1}{2}$ hours per day, at a speed of 6 miles per hour. The cars start every five minutes, except in the afternoon, when they start every three minutes.

The road has a gauge of 3 feet, 6 inches. An ordinary 30-pound steel T rail is used on Clay street, which is set flush with the street and presents a neat, smooth appearance. The stretching arrangement at the lower end has a counterbalance of 3,300 pounds weight on a double purchase, which keeps a constant strain on the rope under all circumstances.

This machinery is so arranged that the wire rope passes for some distance in open view of the engineer, so that it can readily be examined at any minute.

The hill is the best portion of the city for residences, and the road brings within five minutes of the business portion of the city a large amount of property that was comparatively worthless on account of the difficulty of access, but is now in demand, having trebled in value since the road was completed.

Freeing Cable Roads from Snow and Ice.

Mr. A. S. Hallidie, the well-known designer and constructor of cable railroads, has just received through the MINING AND SCIENTIFIC PRESS Patent Agency a patent on a plan designed to protect the tube, slot, and permanent way from the action of snow and ice in winter, and to

or scraper, in combination with the traveling endless rope and a suitable hearing device and grip whereby the plow may be moved along and the track cleaned.

Within the tube, pipes are fixed which extend in the direction of its length and are secured to the sides out of the way of the grip and rope. These pipes are connected with boilers or air or gas heating apparatus, so that hot air, gas, vapor or liquid, as may be found most

FIG. 4.—THE HALLIDIE CABLE GRIP.

desirable, can be passed through the pipes, and the interior of the tubes will thus be kept at a temperature to melt any ice or snow which may enter the slot, and it will also prevent water from freezing in the tube. It will keep the lubricants on the pulleys and other moving parts from becoming thick by reason of the cold, and

over the road. By this construction Mr. Hallidie is enabled to employ the endless cable to advantage within an underground tube for the propulsion of cars in cold as well as in warm climates, without danger of stoppage or damage by snow or ice. As the weight of the cable is very considerable in itself, and as it is carried by the grip at a level somewhat above the line of run of the rollers supporting the same, it will be apparent that the draft of the cable upon the car and snow-plow is in a downward direction, and this draft downward on the nose of the plow tends to keep it close to the track. A directly opposite effect is produced in snow-plows drawn by horses, as there is a continually upward draft given to the nose of the plow. It will be obvious, therefore, that a snow-plow connected to a cable as described, will be acted upon by the cable with a double effect—the first, the old, being to draw the plow along as the cable advances, and the second, its new effect, being to hold the nose of the plow down to the track and to its work.

The Wingard System of Street Railroads.

Mr. Adam Wingard, of this city, patented, Dec. 5, 1882, an improved roadway and mode of propelling cars on the same for use on street railway systems, where the propelling agency may be engines, cables, electricity or horses. It consists in placing and carrying the roadbed and track within and through an underground tube or tunnel similar to the tubes now in use by the cable roads, having a continuous narrow slot or narrow apertures, in and along its top, communicating with the street or surface above, and then in making connection of the car-body with its trucks or running gear that is adapted to travel within the said slotted tube or tunnel. The objects of this improvement are principally to enable lines and systems of street railways to be run without obstructing the surface of the streets with rails, switches, turnouts and other parts of a roadway.

The roadway is placed out of the way of the street traffic, and there is no wear and injury to the rails and other parts of the structure from the heavy trucks and vehicles passing over them. Expense is also saved to railroad companies in street repairs. A light T rail is placed on the bottom of tube where the foundation is solid and fixed, out of the way of snow, ice and all other incumbrances on the surface of the street. It is considered that less motive power will do the same work, with less wear and friction and less jar. Under this system a single track may be placed on narrow streets, with turnouts for passing cars from opposite direction. With cable, or any motor, the motion can be reversed at any point on

Cable Railroads and Real Estate.

It has been the experience in San Francisco, where there are more cable railroads than elsewhere in the world, that the building of one of these roads has an immediate and decided influence in advancing real estate for several blocks on each side of the route for the whole length. And, moreover, large tracts of land previously unoccupied are brought into market. This is, of course, specially the case at the outer or further ends of the roads. The regularity, rapidity, frequency, ease and cheapness of transport is such that people will walk several blocks to take cable cars, passing horse car lines on the way. It is but natural, therefore, that where new cable roads are projected, residences will go up rapidly near the line, and the property be more in demand than when access to it was not so easy.

It has been a theory by those who know nothing about it that these cable lines are detrimental to the streets through which they run. They argue that a steam road would have this effect, and cable roads will do so to perhaps only a less degree. A number of years' experience in this city, however, shows the theory to be entirely fallacious, for wherever one of these roads has been built there the property has advanced, new buildings have been erected and the whole street has become improved in appearance and traffic. The roadbeds are smooth and clean, the cars make little noise, no objection has been found to their presence on the streets. In fact, as we have stated, they have improved the streets and the property in whatever direction they have been run in this city.

In an affidavit made before the Supreme Court of New York in the matter of the petition of the New York Cable Railway Co. for appointment of commissioners, Mr. A. S. Hallidie, of this city, said, in speaking of the advance of real estate: "The property on the line of the Sutter street cable road, after it was finished, became at once in demand and the real estate dealers in advertising property on Sutter street or in its vicinity would generally head it 'on the line of Sutter street cable road,' so that this property brought an enhanced value. Just before the building of the Clay street railroad I purchased on the top of the hill, for the purpose of putting up a residence, a piece of property costing \$3,000, right adjoining 'Noh Hill,' before it was Noh Hill. Eighteen months afterwards I sold it for \$9,000. That I cite as an instance to show what effect on real estate the construction of the cable road had, and it was so through the whole line of the road. A year after the Sutter street road was completed, in or about the month of April, 1878, another road was constructed on the line of California street and run through Noh Hill. The people who had fine residences there found that the cable system was so noiseless and unobjectionable, doing away with the use of

prevent any water which may enter the tube from becoming frozen, or any accumulation of ice or snow upon the permanent way.

It consists in the employment of pipes which are connected with a steam-boiler, hot-air or gas apparatus, whereby the interior of the tube may be kept warm, and the formation of ice within the tube or around the slot can be prevented, and the surfaces of the permanent way kept in such a condition that snow and ice may be easily removed by the employment of a plow

the whole apparatus in working condition. The warm air will escape through the slot and will thus keep it clear in cold weather, and any ice or snow which accumulates on the rails will be kept in such a condition that the plow or scraper will easily remove it without too much strain on the driving rope.

The plow or scraper is suitably supported on a truck running on the rails and provided with a gripping apparatus, so as to be connected with the moving cable so as to move the plow or scraper

the road; no turn-table is required at terminus. Curves can be turned with largest sized cars now in use. The floor of the carriage being nine inches from the street it is easy to get on and off. There are no wheels on the surface to main pedestrians. The ends and sides can be so shaped to make it impossible to get under the body of the car. These are, in brief, the points claimed by Mr. Wingard for his system. He has a number of improvements in detail to perfect the system.

horses, so certain and regular in its operations, petitioned the Board of Supervisors to build a road there and that road was built.

Perhaps no more convincing proof of these assertions can be brought forward than official figures compiled by the assessor's department of the city and county of San Francisco, which show the effect of cable railroads on real estate.

We append a table showing the benefit to and enhancement in values of real estate derived after construction of cable, street railways tra-

versing certain routes and districts in this city, as per official data and figures taken from the assessment roll of real estate of the city and county:

Name of Railway Co.	Date of granting of franchise or construction.	Value of lands, bordering the line of route, in year 1884, showing depreciation.	Percentage of depreciation and loss in value of said lands.	REMARKS.
Clay Street Hill, Sutter Street.	1873	755,740	10-42-100	Always cable power, commenced the use of Cable Power.
California Street.	1870	1,707,415	23-82-100	Always cable power, commenced the use of Cable Power.
Hayes Street.	1870	1,481,430	18-100	Always cable power, commenced the use of Cable Power.
Presidio and Feller.	1870	619,430	20-68-100	Always cable power, commenced the use of Cable Power.
Market Street.	1870	27,300,000	14-78-100	This formerly used horses for motive power, but in 1870 it was changed to cable power, and the Hayes street and McAllister street branches (Cable Power) added. It is now the leading street railway of the city.

The above values are the assessed values of lands for the years given, bordering about 200 feet each side of railway line. The territory lying beyond said 200 feet line, though participating in the benefit of cable facilities, is not included, as it is not needed for demonstration.

The following table shows depreciation and loss in values of real estate over and in certain routes and districts traversed by horse car street railways in the city of San Francisco, as per official data and figures taken from the assessment roll of real estate, and was compiled also by the assessor's department of the city and county:

Name of Railway Co.	First figures taken for the year 1870.	Value of lands, bordering the line of route, in year 1884, showing depreciation.	Percentage of depreciation and loss in value of said lands.	REMARKS.
Omnibus, North Beach and Mission.	1870	19,147,570	12-125-756	The "Omnibus" is the oldest line in the city, and was established about the year 1855; it is the next oldest line to the "Omnibus" and was established within a year or two of the "Omnibus."

The year 1879 was taken as a date for the first year. The year 1879 is the one least unfavorable to the horse car system. Had the date of construction been taken, the difference in "percentage of loss" would have been greatly increased. The year 1879 was deemed most proper as that was the year of general construction of leading cable roads, which marks an era in the railway history of this city.

The most desirable residence property in San

Francisco is along the cable lines. The Clay, California, Sutter, Geary, Market, McAllister and Haight street roads have each influenced the real estate largely, and all along these lines thousands of new fine residences have been erected. The older portion of the city, where horse car lines run, are less in demand for residences or business property. The following paragraph, taken from the real estate review of last week of a local cotemporary, will show that these cable roads have their influence on the markets, even when only projected:

"June and July are the light months in real estate matters. Both buyers and sellers are out of town in large numbers, and frontage and improvements give way in the thoughts of many to fishing, shooting and bathing. During

\$960 to \$2,700 each. The latter price was paid for the lot fronting on Baker street, corner of Fell. The entire block was sold inside of an hour and a quarter, and this briskness, combined with the fair average price, shows that the desire for building lots in what may be called the park district continues unabated. Maurice Dore & Co. had a similar experience with an auction sale of dwelling lots affected by the prospect of the Castro and Market street cable road. That this road will be built at the same time or soon after the Hayes street line there is now little doubt, and real estate in the neighborhood is feeling the influence. On all the streets in the vicinity of the park lines of Market street cable system dwellings are going up steadily and finding ready tenants in

has added to the value of real estate on the lines where it has been operated many millions of dollars, and it is really and substantially so much added to the real and substantial wealth of the city, or that portion of the city wherein the cable system is in operation. The appreciation of real estate is not limited to the mere streets upon which the cable road is operated, but to the cross and parallel streets for quite a distance either way."

Crossing Cables.

The manner in which cable roads cross each other without the crossing cables coming in contact has been a subject of interest, and a great deal of thought and study has been bestowed upon it. There are a number of quite different conditions in San Francisco where cables cross other in different localities. In some crossings the roads are both level at and for a distance each side of the crossings, at other, one line is level while the other has a grade immediately after crossing one way and just before crossing the other. In another case one line leaves a curve before crossing and goes on a curve immediately after crossing the other way. These conditions are made more complex in some cases by the fact that this line that puts the cable in operation first, has the right to have its cable above the other line which must cross under it, and therefore the line having the top cable need not let the grip go from the cable which the line whose cable is under must let go the cable before reaching the other cable which the car has to cross, and again pick up the cable after the crossing has been made. As is well known the grip in holding the cable raises it from the carrying sheaves, so that without some changes the under cable in a crossing would be brought up against the upper ones and injurious wear would result. To prevent this raising up of the under against the top cable it is the general plan to carry the under cable down over a sheave of moderate diameter at one side of a street and under a similar sheave, so that this under cable will be carried from two to three or more feet below the upper one. On the opposite side of the street two other sheaves are placed so as to bring the cable up to its normal height, from whence it passes on to the ordinary carrying sheaves on the line. These defective sheaves being placed on opposite sides of the street to be crossed necessitates the letting go of the cable by the grip a few feet before these deflecting sheaves are reached; therefore, the car must shoot across the street to a point beyond the deflecting sheaves on the opposite side, when the cable can be picked up again by the grip. As the widths of the streets are from 68 to 70 feet it will be seen that either the car must have been given momentum by its speed on one side in order to carry it across the street after the grip has let go the cable, or some assistance must be given it by giving the track a slight downward grade in the direction in which the car is running, and this has been the general manner of accomplishing the desired object. The long distance to which the cars have to be propelled by momentum, and the absolute necessity of having the assistance of gravitation makes the changing grades on a crossing street a serious matter, and Mr. W. W. Hanscom, our well known cable railway engineer, has perfected a plan by which the deflecting sheaves are dispensed with, and the distance which a car has to move across by momentum has been reduced from 70 or 80 feet to 12 or 15 feet, and the deflecting sheaves at each side of the street not being required, the consequent wear of the cable is avoided and no change of grade is necessary. The plan consists simply in arranging a swinging bar having attached to it two sheaves, one above the lower cable and the other at right angles to the first is so placed that it is directly under the upper cable, so that when the under cable is raised by an approaching grip it raises the sheave over it, and thus raises the bar to which is attached the second sheave under the upper cable, which is raised by this second sheave coming up in contact with it; thus as the lower cable is raised, it, through the bar, raises the upper cable out of its way, and when the lower cable is dropped from the grip both cables go down together.

June, however, the dealers have learned of the final determination that two new lines of cables are to be built to help along their business. The most important determination is that the Hayes street cable road is to be built and completed within a year. The officials of the Market street system recently wrote to Easton & Co.: 'As to the Hayes street cable road, it will be built. The only delay is in the grading at the far end of the street. The contract for the work is now signed by all the owners. The grading work will certainly be commenced within 60 days, and the road will be completed in or before 12 months.' The grading has, in fact, been begun. This work followed immediately after the signing of a contract for that purpose by I. Steinhart, the agent for 1,800 feet frontage on Hayes street, belonging to the Seligman estate. The first sale of property affected by the Hayes street road took place yesterday in Easton's auction rooms. The sale was of the full lot bounded by Baker, Broderick, Fell and Hayes streets. The block was subdivided into 25-foot front lots on all sides and aggregated \$45,065. The lots sold for from

instances where they are for rent."

Mr. Charles B. Holmes, president and superintendent of the Chicago City Railway Co., in an affidavit made before the same court, said: "With regard to the effect upon the values of real estate by the cable system, much more definite conclusions can be reached, and this affiant is prepared to state that such appreciation over the lines operated by the company of which he is the president and superintendent as aforesaid, are very marked and decided. A few instances will perhaps illustrate this branch of the case. A house and lot purchased for \$1,000 two months before the construction of the cable system, was sold within six months after the line was in operation for the sum of \$5,440, a gain of \$4,440, attributable exclusively to the construction and operation of the cable system; and that is only a fair sample of many instances. The whole extent of the appreciation of real estate by reason of the substitution of the cable for the horse system can, with entire safety, be said to be largely in excess of the expense of the entire system itself. The substitution of the cable system in place of the horse method

THEY are going to add 20 more stamps to the Camas No. 2 gold mill, at Wood River, Idaho.

Cable Roads in the East.

It took some time after the cable railroad system was proved a success in San Francisco before any of the large cities in the East would adopt it; and even now it is not in use in as many places as one would suppose in view of its superiority over ordinary systems of street transportation and its influence in advancing real estate values. The system has had to meet strong opposition from owners of horse car lines already in operation, and that peculiar prejudice which exists against such decided innovations. Still, the cable system is gradually gaining ground and in several Eastern cities roads have been built and a number of others are projected. In an interview this week with Mr. James Gamble, General Manager of the National Cable Railway Co., we obtained the following facts concerning cable roads in the East.

In New York

They are building a road on 125th street, from river to river, from the corner of Tenth avenue on 125th street, all to be run by one station. This road is being built by the Third Avenue Horse Railroad Company, and if it

show that breakage of cable seldom occurs and that delays from this cause are unfrequent.

In this connection it may be of interest to note the cable roads projected by the New York Cable Railroad Company.

The Rapid Transit Commission appointed by the Mayor, on November 30, 1883, granted a franchise to this company to construct some seventy-two (72) miles of cable railway, of which about fifty-two (52) miles will be surface railway, ten (10) miles will be elevated and ten (10) miles may be either surface or elevated. The routes consist of:

First—A main East Side axial line, extending from the Harlem river, via Lexington avenue, Irving place, Lafayette place, Crosby street, Brooklyn Bridge terminus, William street, Wall street and Broad street to South Ferry, with a branch to Wall Street Ferry, the portion from Great Jones street to Frankfort street to be elevated, the remainder to be on the surface.

Second—A main West Side axial line, extending from the Battery, via West street and Tenth avenue to Fort George, of which the portion from the Battery to Thirty-second street will be elevated and the remainder may be elevated or surface; with an elevated branch extending from West street at Christopher street, along Thirteenth and Twelfth avenues to Seventy-second street.

tem may be made under the General Surface Railroad Act of 1884.

These routes constitute a system reaching all parts of Manhattan Island, and enabling passengers to make a continuous trip from any point to any other point on the island, reached by the system for one five-cent fare. The company has decided to use the system and appliances known as the Cable Railway, which have been so successfully operated in San Francisco and Chicago in this country, in London and Liverpool, England, and in Melbourne, Australia. This system, which is controlled by the National Cable Railway Company, presents the following advantages, viz:

1—An unlimited capacity for traffic at the times when greater capacity is needed; 2—The ability to run at any rate of speed, on surface railways, that municipal authority will allow; 3—More promptness in stopping and starting than with horse cars, causing less delay; 4—Greater safety from accidents causing injury to persons; 5—Freedom from interruption by snow; 6—Greater cleanliness, leaving no animal voidings affecting both health and comfort. The style of cars proposed on these various lines is shown in the engraving on this page.

In Philadelphia.

In Philadelphia a combination of the princi-

way Co. A road under construction in Cincinnati, and one also in St. Louis, are both, it is claimed, working on other patents which are infringements on the Hallidie.

The Chicago Road.

A Chicago road has ten miles of double track running on two different avenues, with a single station located on State street. The construction of this road is first-class in every respect, and has been a success from the start. When I passed through the road last October, the president informed me that they were carrying 16,000 more passengers per day than heretofore. He accounted for this large increase by the advantage of the cable road over the horse road, having caused extensive building outside of the city, and be found also the time made was so much quicker that people would walk two, three and four blocks from the horse road to take the cable road, the road at this time carrying on an average 125,000 per day. It may be asked, by the success of this road, why there were not other roads in Chicago. The reason is that there is no device for cable roads crossing drawbridges, and also that the present road controls the "Hallidie" patents for that city.

The experience so far has been that there is no necessity for heating the tube in winter as

CABLE CARS FOR PROPOSED ROADS IN NEW YORK.

proves successful they intend to place the cable all the way from 125th street on Third avenue to the post-office. This road is being constructed under what is called the "Miller" patents, which are claimed to be an infringement on the "Hallidie," and suit has already been commenced by the National Cable Railway, which controls the "Hallidie" patents east of the Rocky mountains. The object of the New York Cable Railway was to organize a general system of cable roads covering all the principal streets in the city not occupied by the horse roads. A commission appointed by Mayor Edson gave this company, under the Rapid Transit Act, 29 different routes covering about 70 miles of street. The plan of this company was to convey passengers between any two given points for one fare, 5 cents. This met the opposition of all the horse roads as well as the elevated roads in the city of New York, and no means have been left undone to defeat the scheme.

An elevated road, probably one mile long, is about completed at Hoboken, run by cable on the Hallidie system, from the landing and connects on the Hoboken Heights with several different horse roads.

The cable road being constructed on Tenth avenue has arranged for two cables in each conduit, the object being to provide against accident. In case of breakage, one cable to take the place of the other—one always remaining idle. To accomplish this the chamber run below the bottom tube had to be made over 30 feet, necessitating sub drains. The complication of machinery necessary to run extra cables and the sub-drains in the tube will undoubtedly give the cable company a great deal of trouble.

Experience of cable roads in this city goes to

Third—A central line, extending from Tenth avenue, via Fifty-ninth street, Madison avenue, Twenty-third street, Second avenue, Myrtle street, and Catherine street to Madison street.

Fourth—An East Side line, extending from Harlem river, along First avenue and Twenty-third street to Second avenue.

Fifth—Cross-town routes, thirteen (13) in number, extending across the island and reaching direct or by branches the ferries at Cortlandt, Chambers, Catharine, Grand, Roosevelt, Desbrosses, Christopher, Twenty-third (East and West), Thirty-fourth, Forty-second, Eighty-sixth and Ninety-second streets.

Sixth—A route commencing at One Hundred and Fifty-fifth street and extending along the Kingsbridge road to Kings Bridge.

Seventh—A route commencing at the Harlem river at Kings Bridge and extending to the Yonkers line.

Eighth—A branch from Tenth avenue along One Hundred and Eighty-first street, crossing the projected new high level bridge over the Harlem river to Aqueduct avenue.

Ninth—A route from Inwood Ferry along Inwood and Dyckman street, to River street on Harlem river.

In addition to the above, extensions have been located under the General Surface Railroad Act of 1884, including

Tenth—A route commencing at Forty-second street and extending via Broadway and the Boulevard to One Hundred and Fifty-fifth street, there connecting with the route extending along One Hundred and Fifty-fifth street from North river to the elevated road on Eighth avenue. Any further extensions of surface railways needed to complete or protect the sys-

tem may be made under the General Surface Railroad Act of 1884. These routes constitute a system reaching all parts of Manhattan Island, and enabling passengers to make a continuous trip from any point to any other point on the island, reached by the system for one five-cent fare. The company has decided to use the system and appliances known as the Cable Railway, which have been so successfully operated in San Francisco and Chicago in this country, in London and Liverpool, England, and in Melbourne, Australia. This system, which is controlled by the National Cable Railway Company, presents the following advantages, viz: 1—An unlimited capacity for traffic at the times when greater capacity is needed; 2—The ability to run at any rate of speed, on surface railways, that municipal authority will allow; 3—More promptness in stopping and starting than with horse cars, causing less delay; 4—Greater safety from accidents causing injury to persons; 5—Freedom from interruption by snow; 6—Greater cleanliness, leaving no animal voidings affecting both health and comfort. The style of cars proposed on these various lines is shown in the engraving on this page.

The Philadelphia system has two stations, one on Market street and one on Columbia avenue.

Kansas City.

There is a road under construction at Kansas City some two or three miles in length. This road is about completed and they also claim that they are constructing it under the "Miller" patents. The first attempt made to run the road with what was called the "Miller" grip was a failure, the grip breaking and nearly killing the engineer, and at last accounts they were constructing a new grip which my informant stated to be like the "Hovey," which is used upon the California street and other roads in this State, and which is owned by the Hallidie Co. Suits have been commenced against this road by the National Cable Rail-

way Co. A road under construction in Cincinnati, and one also in St. Louis, are both, it is claimed, working on other patents which are infringements on the Hallidie.

The Chicago road has ten miles of double track running on two different avenues, with a single station located on State street. The construction of this road is first-class in every respect, and has been a success from the start. When I passed through the road last October, the president informed me that they were carrying 16,000 more passengers per day than heretofore.

He accounted for this large increase by the advantage of the cable road over the horse road, having caused extensive building outside of the city, and be found also the time made was so much quicker that people would walk two, three and four blocks from the horse road to take the cable road, the road at this time carrying on an average 125,000 per day.

It may be asked, by the success of this road, why there were not other roads in Chicago. The reason is that there is no device for cable roads crossing drawbridges, and also that the present road controls the "Hallidie" patents for that city.

The experience so far has been that there is no necessity for heating the tube in winter as

As to the life of a rope, which is a somewhat important question, Mr. Hanscom said but little in his paper, which is published in another column. The conditions under which they run are so different in this city, and the care they receive so different. On the Clay street road, the first rope lasted the longest. It lasted two years and three months. The last rope lasted 21 months, but it had more work and wear, owing to the line running longer hours. The traffic is, however, uniform, and there are not so many stops necessary as on the Market street road, which has the hardest wear of any in the city, on account of the frequent stops. The rope which runs from the engine house to the ferry wore out in six months, while that from the engine house to Twenty-eighth street was in good condition at the same period. This is on the same road, but the latter rope has not to stand so many stops and starts.

The Market Street Cable Road.

The Construction and Operation of an Important Cable Line.

The Market Street Cable Railroad, the last one built in this city, is the most extensive one and goes through the heart of the city from the water front to the suburbs. The equipment of the road is first-class in every respect, no expense having been spared in its construction. Traveling mainly on a street where there are some eight other lines of street cars, it immediately became the favorite, owing to the convenience and comfort of its cars, the speed at which they travel, and the frequency at which they pass.

Shortly after the completion of this road we published a description of it, which we now reproduce in our "Cable Railroad Edition," as this description, with the engravings and details, will be valuable for reference to those interested in this branch of modern engineering progress. As we built the first of these roads here, our experience is useful to all others; and no doubt most of the roads built in the future will look to those in this city as examples for guidance.

The building of this road had the effect of enlivening, so to speak, a large tract of this city. For some years, south of Market street and out by Valencia, the city has been rather "slow," the northern and north-western portions improving much more rapidly, and having improvements of better character. The length of time it took to get out towards the Mission and thereabouts, or even Market street to Tenth and Twelfth streets was detrimental to these portions of the city. The cable cars now go from the ferry to the end of Valencia street in 34 minutes, and run frequently. All those portions of the city which the road or its branches tap have felt the good influence of rapid communication and have been extensively built up since the road was commenced.

The Road and Its Branches.

The main line of the road runs on the principal thoroughfare of San Francisco—Market street. The streets north and south of this all open into it, and the traffic is larger than on any other avenue in the city. Not only do the north and south streets, such as Kearny, Dupont and Stockton, and Second, Third and Fourth open into Market, but the streets north of it running across Kearny and Dupont, such as O'Farrell, Sutter, Post, Geary, etc., also open into it. This latter line of streets run at an angle from Market. The lower ends of the cables of the Sutter and Geary street cable roads are at the junction of these respective streets and Market. The peculiar central position of Market street, therefore, makes the road a highly important one. It was supposed by many that a cable railroad on that thoroughfare would be almost impracticable, owing to its crowded state at certain periods of the day. Many thought the cars would have to move so slowly that they would be unpopular. Experience has, however, proven these fears to have been unfounded. In fact, the line makes better time than any of the cable roads, the cable running about 8 miles an hour; and, including an average of 30 stops, the cars run from one end to the other at a rate of about 7½ miles an hour.

It has been found, too, that the speed at which the cars are run tends to make people more cautious than on slower roads. Moreover, the track is kept clear easily. Teamsters know that the cars run fast, and at the first sound of the gong clear the track, not taking time about it, as is apt to be the case with slower roads.

People are not apt to try to run across in front of these cars, but seem rather to prefer letting them pass. The quick speed, therefore, has been advantageous to the road, and is very satisfactory to the public.

There are several branches to this road, transfers for which are given passengers without extra charge, the fares being five cents. At Fifth street is a horse-car branch one mile long, running south. At McAllister street is a cable railroad branch, which runs to Golden Gate Park. There is a separate cable to Market street, run by a separate engine, and the cars switch off from this to the Market street cable at the junction of the two streets. This branch makes another complete line from Golden Gate Park to the ferry. The engine house of the line is at the further end of the road.

At Hayes street there is a horse-car branch to Hayes valley, through a populous neighborhood. The next branch to the right is that of Haight street. Every other car on the main line switches off here to go out Haight street to Golden Gate Park. We give a profile of this line in another column. At the end of the Haight street line a road is built to run as far as the Pacific Ocean Leach and Cliff House. This is run by steam dummies, and is a separate line from Haight street, though con-

with a heavy brick flooring and foundation to the boilers, engines, heaters, etc. The room is well lighted and ventilated. In the rear of the engines are the long pits and tracks for the stretching apparatus. At no distant day we will have a detailed description of the underground workings at the junction of Market and Valencia streets.

Outside, the most prominent feature of this building is the chimney, which forms an important landmark, and is next to the largest on the coast. The base is nine feet below the level of the fire-room floor, so that it is about 24 feet below the surface of the ground. The foundation is 30 feet square, battering in one inch in the course until it comes to 16½ feet square, where the flue enters. Then it goes up to the water-table, about 10 feet above the surface of the ground. For the rest of its height the chimney is in the form of an eight-cornered star. The inside is a circle seven feet six inches in diameter. The top of the stack is 175 feet above its foundation, or 166 feet above the fire-room floor. It was necessary to have this very high stack not only for good draft, but also to deliver the products of combustion high up out of the way. We give an engraving showing the exterior of the engine house. An engine house of similar design has since been constructed on

& Co., of this city. The exhaust pipes were made by H. W. Rice, manufacturer of portable engines and boilers, in this city and a very satisfactory job he made of them.

The boilers in use are the first of the Babcock and Wilcox type ever put up on this coast. They came here all built and ready to put up, and are guaranteed to be of 250 horsepower for each section, there being four sections. These boilers are very substantial looking structures. There is a Llewellyn water heater five feet in diameter and a fine pair of the Dow steam pumps, made in this city.

The Driving Arrangement.

The driving method is what is known as the American method of driving, and is about the same as that used on the "Golden Gate" in Penn. The engraving on page 46 shows the general arrangement. Two drivers, H H, 12 feet in diameter are placed in line. The rims are loose, and in between these rims are bolted blocks of wood two inches thick and set on end. Maple is used here, but beech is supposed to be better. The rope passes in from the street on a slight downward incline, just clearing the top of the forward driver and passing on to the top of the rear one (or that next the engine, K), it being set six inches higher than the other driver.

It passes three-quarters of the way around, and thence upward, diagonally forward, over the top of the forward one, then downward backward, just clearing the bottom of the rear one, to the tension sheave, M, on the tension carriage. There are only three-fourths of a turn on each of these drivers or one turn and a half in all. Yet this drives 24,557 feet of rope with heavy loads. One would hardly suppose that mere friction of the rope would admit of this, but that it would slip. The tension apparatus is the secret of this result; without that it would be impossible. The automatic action of the weighted tension sheave, however, is such as to keep the rope closely jammed on the drivers, so that it is not easy for any slip to occur. The great advantage of this method is the small number of wraps on the drivers, as wraps on drivers

FERRY TERMINUS, SHOWING CARS OF THREE LINES IN COURSE OF ARRIVING, TURNING AND DEPARTING.

necting with it. This Park and Ocean road we describe in another column of this issue of the PRESS. The Haight street branch is a very important one, and the city has been built up rapidly out in that direction. Opposite the main line engine house is the Market street extension branch, soon to be run by an independent cable, provision having been made in the engine houses for the cable for this branch. It is one mile long. Baldwin locomotive dummies are now running the cars on this branch.

The grade on Market street is 3½ feet in 100. The grade on Haight street is about 12½ feet in 100 at the steepest place, and the steepest grade on McAllister street is 12½ feet in 100. The diagram shows a profile of Haight street.

The Engine Houses.

The engine houses where the motive power of the cables of the Main line and Haight street line is applied, is on the south side of Market street at the junction of Valencia. At this point Valencia leaves Market by a curve to the southeast, and Haight street branches off at an angle of about 35 degrees from Market to the northwest, some 500 feet before Valencia is reached. In the rear of the engine house are bunkers which hold 2,000 tons of coal, which may be dumped into them through chutes in the yard above. Heavy brick pillars and arches support the roof of this portion, which forms the floor of the yard above. Outside the coal bunkers is an artesian well which supplies the boilers with water. One of Dow's direct-acting deep-well pumps raises the water from this well, supplying first the heaters for the boilers, the surplus going to a tank above.

The main portion of the basement is covered

the block bounded by McAllister, Lett and Fulton streets and Mission avenue for operating the McAllister street line. This same engine will be used shortly for operating the Hayes Valley branch, which will soon be turned from a horse to a cable line.

The Engines.

The power for the first-named lines is two pair of engines, with cylinders 31x48 and 24x48, a large and small one being compounded to work in pairs. The expansion cylinder has a capacity of double the initial cylinder. They are compounded by direct connection between the bottoms of the large and small cylinders. There is no extra receiver, the pipe answering as the receiver. Only one pair run at a time, the other pair being spare engines, to use in case of breakage of the others. These engines have Scott pillow-blocks, and the O'Neil cut-off, with automatic governor. They were made by the Union Iron Works of this city. The engines are well made and are doing very satisfactory work, the cards showing great efficiency.

Each pair of engines furnishes 400-horse power in ordinary working, and is capable of working up to 700-horse power. The pinion on the engine-shaft is 4 feet 1 inch in diameter and 20-inch face. It connects with a V-toothed gear 12 feet 6 inches in diameter, and 20-inch face, which in turn meshes with another gear of same size. Each gear shaft has two reels or drivers for the rope. The engines are set in pairs 19 feet apart. The diagram given shows the position of the engines with relation to the reels, guide-pulleys and tension apparatus. The steam pipes for the engines were furnished by W. T. Garratt

ers form one of the principal sources of breakage and wear on cables. The improvements on the old English system (where numerous wraps are used) patented by S. B. Whiting in 1876-7, and used on the Brooklyn bridge, are unsatisfactory, for this reason: the friction wheel from which the power is derived, located in line between the shafts carrying the driving drums, relieves the bearings, but the old and principal fault of the wrapping of the rope still remains. As the part of the pulleys where the rope first comes on wears the most, the driver is not kept of uniform size. Therefore, the rope has to "overhaul" to compensate for difference in circumference between the sides of the driver where the rope comes and goes off. This overhauling throws excessive strain on the rope and soon breaks or tears it into pieces. By the system we have described as in use here this objection is overcome, the rope nowhere taking a complete turn of any driver. In the engraving F F shows the Market street cable; O O the Haight street angle sheaves; P P the Market street angle sheaves; and S the cars on the tracks.

On the same shaft carrying the drivers, heretofore mentioned, are large gears, of about the same diameter as the drivers, operated by a pinion on the engine shaft of one-third their diameter, so the engine makes three revolutions to one revolution of the drivers. V-teeth are used on all these gears, and they are four and a half pitch and 20-inch face. There are four sets of drivers for the four ropes, but one set of gears and one pair of engines operates them all. The other pair of engines is held in reserve as a spare set

in case of accident. The engines for the other lines located in the McAllister engine house are simple engines, 18x48 feet, arranged to work either singly or together.

The Stretching and Tightening Arrangement.

The tension of the wire rope on all these roads is something which has to be provided for, otherwise there would not be a uniform tension maintained. Moreover the change in length, with the ordinary changes in temperature, during the day and night, of 40,000 feet of metal cable, must be also looked after. On a hot day the cable is several feet longer than on a cool one, and this ever-varying change in length must be compensated for, and the apparatus for doing this must be automatic. The rope is furthermore continually lengthening by wear, and during the life of a rope the total stretch is about one per cent of its total length. The method in use on this road is considered to be the best known. Of course each rope has to have a separate stretching and tension arrangement. The principal object in keeping the uniform tension is to prevent the rope slipping on the drivers, it being driven merely by friction. Behind the engines in the engine room, and in line with the driving pulleys, brick-lined excavations 165 feet long each and 5 feet wide and deep have been made, one for each cable. Over each one is a stretcher arranged for a separate cable. A description of one will serve for all. A large and heavily framed carriage, L, mounted on wheels and moving on tracks, is placed over the excavation. A pair of tracks, close together, is on each side, and each pair forms a rack-bar, with which a pawl on the carriage engages. These pawls prevent the carriage moving forward, as the strain of the cable tends to make it. On top of this main carriage is a smaller one, also on rails, the rails being on the main carriage.

The small or supplemental carriage carries a vertically revolving pulley, M, about 12 feet 6 inches in diameter. The cable or rope, after it passes around the main drivers of the engine, extends back around this sheave on the carriage. A very heavy weight, N, weighing about 10,000 pounds, hangs on a chain and connected with the supplemental carriage, passes over a chain wheel on the lower carriage and draws backward on the upper one, thus keeping a constant tension on the cable equal to one-half the amount of the weight, the strain being divided between the upper and lower ropes. This tension sheave prevents any slipping of the cable on the drivers, as elsewhere described.

The function of the lower carriage is to take up the permanent stretch of the rope. When it is found that the weight is settling down into the pit it is known that the cable has permanently stretched. Then the lower carriage is moved back and the pawls are dropped into the ladder formed by two T-rails with pins through the webs, forming a sort of rack bar, thus holding the lower carriage in its position. This moving of the lower carriage is accomplished readily, notwithstanding the strain of the cable, and without necessitating the slowing of the ropes or interfering in any manner with the operation of the road. A heavy tackle is hooked to the rear end of the carriage, and the tail rope or hauling part is taken to a spindle or gypsy on the end of the axle of the main sheave on the supplemental carriage. This is revolving steadily all the time, and by taking a few turns of the rope the tackle is operated by the power of the cable itself and the carriage hauled back on its rails, the pawls before described automatically engaging with the teeth or pins provided by them, thus holding the carriage at the desired point. As the lower carriage moves back the weight rises and the upper carriage remains stationary, but changes its position with relation to the lower one. That is, when the lower carriage is drawn back as far as desired, the supplemental one is at the front end of the lower one ready again to be moved back auto-

street, 20,002, and the auxiliary 432 feet long. The McAllister street cable, from the engine house at Masonic avenue to Market street, is 20,543 feet, and from the engine house to the western terminus at Fulton and Stanyan streets, 5,593 feet. The last two are the same

not entirely satisfactory. Moreover, in changing a street road operated by horses and having the usual large stock of common four-wheeled cars, to a cable road, several things had to be taken into consideration. The outlay for reconstruction must be large in comparison with the

open all around, but has a roof supported by ornamental posts. In the center is the brake and grip mechanism, and the engineer or grip man stands isolated in such a position that he can see ahead and on both sides. There are two front seats on each side, but the center is open in front, so no passenger can obstruct the view. The seats on the side are wide and comfortable, and set back so the passengers' feet are inside the line of the sides of the car; they are completely protected from passing vehicles by four strong posts. They are high up, also. Outside is a broad step running lengthwise the car on each side, and on these many can stand and hold on by the strong iron vertical hand-bars shown in the engraving.

The object of arranging the seats so that the passengers may sit with their feet inside the line of the side frames of the car, is to avoid liability to accident. In case of a wagon being backed against the car, or striking it in any way, the passengers are up out of harm's way. The height of the seat takes them up out of the dust also. The whole arrangement of these cars has proved highly satisfactory to the public and to the company. They carry large loads of passengers, run smoothly, and round the curves readily. They are, moreover, handsome in appearance. They are constructed in such a manner as to combine great strength with lightness. A noticeable feature is the absence of any joggling or jarring motion ordinarily incident to dummies. Market street being the main thoroughfare in the city, it was absolutely necessary to make the cars safe. It is easy to get on or off, by reason of the many posts and handles for support.

There is no communication for passengers between the car and dummy, and people cannot come out of the front of the car to alight. Most of the old street cars of the Market street line were utilized by an open portion being built on, though unless it was pointed out, the connection would not be seen. The front platforms are removed, but otherwise the cars are not changed. These cars are light and well ventilated, and their interiors are all of bright, varnished woods, with wooden perforated seats. The car body has each end supported on four wheels, united by a frame or truck having a pivot or swivel, so that the trucks may turn and accommodate

themselves to the curvatures of the road, as on ordinary passenger coaches. The grip is mounted on the solid truck of the forward or open portion of this car, an opening being made in the floor for it to project up through. As the distances between the pairs of wheels on the truck is small, the movements of the truck in accommodating itself to the curva-

kind of cable as the main line, but the first that were in use were made by the California Wire Works of this city. Since the completion of the road a machine has been constructed at the Valencia street engine house, from designs prepared by Henry Root, the company's engineer, by which the company manufacture their own cables. It is a compound machine,

original cost of the road, and as the total cost of the cars is but a small percentage of the whole, the car must be so constructed as to fulfill the following requirements: 1. To be as safe as possible for the public. 2. To ride easily, either empty or loaded, and carry large loads if required. 3. To be easy to get on or off, and neat and symmetrical in appearance.

SECTION OF ANGLE SHEAVES, DRIVERS AND TENSION APPARATUS.

matically by its compensating weight. By the arrangement described 330 feet of each cable can be taken up.

The Wire Cables.

The first wire cables in use by this company were made by John Roebling Sons Company, of Trenton, New Jersey. The rope is an inch and a quarter in diameter and weighs 2½ pounds to the running foot. It is made of crucible steel wire. There are 6 strands of 19 wires each around a half-inch manilla rope heart. The main or Market street cable is 24,125 feet long; the Valencia street is 20,194, and the Haight

completing the cable and winding it on the roll, in one operation, and is the only machine of the kind ever constructed. Tar is first used to fill up with and oil is added as the rope fills, until it alone is used. They have to avoid the use of tallow and other animal fats.

The Cars and Dummies.

One of the questions in connection with the new road which was most carefully considered was that of the construction of the cars. It was known that the traffic would be heavy at certain hours, both morning and evening, and that the ordinary form of car and dummy was

4. To be cheap in first cost and maintenance, and so arranged that old horse cars can be converted to cable cars without great sacrifice to property. All of these requirements seem to be fulfilled in the combination car in use on the Market street road.

The cars and dummies on this line are made in one. They are different from any previously made, being entirely original in design. They have more the character of a steam than a street car, as the engravings show. The whole car is 34 feet long and weighs 9,600 pounds. The forward part, for a distance of 14 feet, is

ture of the track are small, and do not affect the grip. The long car-body can make long and sweeping curves, necessitated by its length very readily, as the two trucks so widely separated are each on pivots, like the trucks of steam cars. This rigidity of the ordinary street car running gear is avoided, and there is no "grind" on the rails. It is the first time this system has been applied to street cars. The length of these cars necessitates some better form of running gear than in ordinary use, so the system described was adopted.

The cars ride smoother than any street car in

the city, there being none of the jolting motion so common. The roadbed is so solid and the rails so well joined that the whole road is smooth. The cars are well lighted by cut and center lights and brilliant head-lights are used in front, which light up the street far ahead. There is a large gong outside and on top of the car in front, which, while it sounds a loud alarm, is not heard so much by the passengers as by those it is intended to warn. The engineers and conductors are uniformed neatly; and during the hours when crowds prevail, there is an extra conductor or collector put on the forward car.

On the main line rope there are 41 cars at a time; on the Valencia St. line there are 33 cars in use; on the Faight St. 19, and on the McAllister St. 24 cars, making 76 combination cars in all.

It is a mistaken idea that these cars can run no slower than the cable. By reducing the grip pressure, by means of the lever, the cable slips along and the car does not move so rapidly; in fact, it may be slowed to a snail's pace, almost, while waiting for a team to get out of the way; and the starting up is so gradual that no jerk is felt.

Among other peculiarities in the construction of the cars is that of the fender or "kid-catcher," for picking up any stray youngsters who may fall on the track. It will not do to put a fender or catcher on the car itself, as the car has a considerable range of movement from variable loads and the plunging motion caused by inequalities of the road. The fender cannot be, therefore, readily carried at a fixed distance from the ground.

The method adopted is to secure to the forward edge of the rigid truck frames in front of the wheels a plank or frame extending in front of the car itself. It extends across the whole width of the car, and is not over two or three inches above the surface of the track. Knees or braces secure it firmly to the truck frame. The front edge is rounded. The construction of this part of the car is such as to lessen danger in the case of persons falling in front.

The Trucks, Tracks and Wheel Brakes.

We give two engravings, showing the details of the running-gear of these cars. (See page 47.) The rear truck carries the track-brake, which is between the wheels on each side. In addition there are the usual wheel brakes. The forward truck carries the grip and brake levers. A rod connects the rock-shaft of the track-brakes with the hand lever on the front truck. It will be seen that these trucks are similar to those in use on steam railroads, and that they are connected by a single king-bolt or pin with the body of the car. We stated elsewhere that by the use of these trucks the cars turn the curves easily and ride without jolt.

The brakes used on these cable railroads are very important factors in the safety of the system. On this road, particularly, running at the speed it does and through a very crowded thoroughfare, it is necessary to have the brake gear very efficient, in order that sudden stops can be made. It is found in practice that one of these cars, weighing 9,000 pounds, and loaded at that, while running at a speed of 8 miles an hour can be stopped in 10 feet. Even air-brakes could not excel this. While the ordinary brakes are attached to the wheels in the usual way, one set for the gripman and one for the conductor, each set acting independently, the main dependence is placed on the track brake.

These track brakes are the outgrowth of the cable railroad system, being adapted for use on very steep grades, where if the wheels were locked even, the car itself would slide on the rails. It is a very powerful appliance, and by its means one of the heavily-loaded cars may be stopped very suddenly. In the first place it may be stated that both the wheel brakes and track brakes are entirely independent of the car body, the whole mechanism being on the trucks, or running gear. The track brake is on the rear truck, as the engraving shows, between the wheels, its operating lever, which is by the side of the grip-lever and similar to it, however, being under control of the gripman who handles

the grip. Under the car is placed a rock shaft, operated by the lever, which works toggles or joints, forming a pair of powerful levers, which press down on each track a broad block of wood. The weight of the car can almost be lifted on these blocks, so powerful is the leverage. The device is very effectual, works quickly, and is not liable to breakage. It is operated by a hand lever. The ordinary wheel brakes are controlled by a foot lever near the engineer (see engraving), so when the grip is released he can slow down with the wheel brakes, or stop suddenly with the track brake. In addition, the conductor can operate the wheel brakes on the rear part of the car. The engineer can throw down the track brake on the rear part of the car, and lock the four wheels on the forward part at the same time.

The Grip.

The most important appliance on this class

of cars is the gripping attachment, or grip, by which connection is made and unmade between the cable and the car. It is necessary to have a gripping apparatus simple in construction, with as much as possible of its mechanism above ground, so as to be accessible at all times, and to be carried at a uniform depth below the slot, so as to always maintain its position relative to the slot. In these cars the grip hangs on the fixed part of the truck, and not on the car itself. The truck is like that of a coach. The grip is between the center bolster and the

by bolts, and carries the lower jaw, while the inner frame, which slides up and down upon the outer one, carries the upper jaw, the quadrant, the operating lever and adjusting mechanism, and is held in place by guide plates extending across the stationary inside frame, and between which it slides. The frame carrying the jaws passes through the slot directly down alongside the cable, without offset. The grip-bar on which these parts are mounted is secured and supported by a frame on the running gear or truck, and not on the car itself. The car body can therefore be mounted on springs without any of the spring motion being imparted to the grip and through it to the cable. In the way in which this grip is arranged, all the parts liable to get out of order are accessible, and it is not necessary to provide pits in which to examine them. The engraving given herewith shows the con-

ROOT'S PATENT FORWARD TRUCK, WITH GRIP, BRAKE LEVER AND FENDER.

struction of the grip. (See page 48.) When the car is at a standstill, the wire cable passes along over the chilled-iron grooved rollers at each end of the lower die. The lever operating the grip is then inclined forward. When the gripman desires to start the car he moves the hand lever back. This action moves the inner frame downward, carrying with it the upper jaw or die. This die consists of a hollow piece of soft cast-iron secured in the lower end of the sliding part. The lower die is a shorter piece of soft cast-iron fitted lengthwise between

the two rollers. This is arranged with set screws to be raised to take up wear. The upper die is longer than the lower, and as it is forced down by the inner frame it rests on the moving cable, and pushes or presses it tight on the rollers before pressing it on the lower die. Gradual motion is thus imparted to the car, without jerk or jir. A still further downward motion of the upper die forces the rope or cable on to the lower die, the cable being thus held tightly between the dies. A reverse motion of the lever raises the frame and upper die, and releases the cable and allows it to run through freely without imparting any pressure to the car. The brake can then stop the car. The head of the toggle operating the inner frame slides up and makes a difference in the length of link, so that wear of the upper die is accounted for. Wood has been tried for the dies, and so has brass, but soft iron is found to be as good. The dies are easily changed. The frames of the grip are made of steel, from the Judson Iron and Steel Works in Oakland. Phosphor bronze was found to be too soft. Steel seems the best. They have been made of common cast-iron, but

PATENT REAR TRUCK SHOWING TRACK BRAKE.

forward axle of the truck, and there is but little motion to it, as the gripman who operates it stands directly over the king-bolt, around which the truck is free to swivel.

The grips of these cable roads are as much a mystery to most people as a steam engine. Men ride behind locomotives and on steamers every day who have no definite idea of the power that moves them. They ride on cable cars day after day and year after year, see a man use a lever to stop and start, but beyond knowing that something "grabs" the rope, they are in the dark. To describe in detail the operation and construction of a grip would puzzle nearly all. Yet the operation is quite simple, now the idea is worked out, though the problem had many difficulties which only experience and ingenuity have been able to overcome.

The grip in use on this road is one invented and patented by Mr. Henry Root, the engineer and superintendent of construction. It is formed of two frames, one sliding outside the other. The outer one is secured to the grip-bar of the dummy (or forward part of the car)

The concrete was not filled in the center, but a core was temporarily used, so the tube or rope-way was thus formed between the slot-iron supports. As nearly all the weight of the traffic is on the rails, the tendency of the rails to go down is resisted by the deep girder, of which the heat tie forms the top and this continuous mass of concrete the bottom. There is no danger of unequal settlement. We give an engraving which shows a section of the roadbed with these piers. The soil in which the road is built is sandy.

this is too brittle, as a blow may break it. The first thing to suggest itself would be wrought iron, but there are several objections to its use. It is more expensive than a casting, and its liability to bend is a serious objection. While the material must necessarily be tough and strong, it is better that it should break than bend under any severe strain, since it is preferable to lose a grip than to have to endanger the tube, cars or passengers. The law prescribes that the slot in the street through which the grip passes must be no more than three-fourths of an inch wide, so it will be seen there can be no spare metal, for there must be some play. This grip works very satisfactorily indeed. The grips were manufactured in this city by William H. Bireh, of the California Machinery Works, as were also the sheaves and tighteners.

Construction of Roadbed.

In laying out the plans for this line the experience of other cable roads was carefully considered, with a view, if possible, of providing against difficulties formerly met with. Every detail was studied with the utmost attention. The constructors had themselves built one successfully operating cable road in the city, and were fully acquainted with the requirements. Cable railways are ordinarily constructed of iron ribs of the form of the tube, set at suitable intervals, to which the slot iron or timber, as the case may be, is bolted, and the spaces between these ribs filled with wood to form a continuous tube. Outside and independent of this tube the rails are laid, supported on short ties or other foundations, and connected horizontally with the iron ribs by short bolts or rods, but are liable to settle by the undermining of their foundation, without regard to the tube or the other rail of the track. This will frequently occur by the renewal of the paving outside of the track, the introduction of house-connections with the main sewers, or other disturbances of the track. This settling causes great inconvenience.

It was determined, in building this road, to form a single rigid structure by connecting the rails and slot irons by yokes, and uniting the whole by employing concrete. The engraving shows plainly how the roadbed has been made. (See page 48.) The main tie or yoke connecting the opposite rails is formed of old railroad T rail, bent in suitable shape, head down. It embraces the tube and has fastened to the ends suitable chairs or plates, to which the rails are secured. From the lower part of the curved yoke extend upward two supports for the slot-irons. The lower ends of these are sufficiently separated to form the necessary width for the tube.

Tie-rods connect these supports with the main yokes through the chairs. The two rails, slot-irons and yoke are then all connected rigidly together as one. These yokes are placed every three feet along the length of the road. The rails and slot-irons being connected in the same structure, all the parts are maintained in their relative position. Whatever may occur to alter the place of one has no effect unless the change is sufficient to effect the whole structure.

In building the road the first thing done was to excavate places every nine feet, in which was constructed a concrete pier sixteen inches thick by five feet long crosswise the track, on which the main structure stands.

There are altogether some 9,000 of these piers, the foundation of which is 10 feet below the rails. For a number of blocks at the lower end of Market street the street is "made ground;" that is, it has been filled in on to the bay mud. In order to get a solid foundation, piles had to be driven to support these piers, so all tendency to settle was avoided.

The piers being built and the trench dug, a section of rail and slot-iron was put in place on the piers, and concrete filled in, filling the space between the rails and slot-iron, and forming a support for the iron-work.

The concrete was not filled in the center, but a core was temporarily used, so the tube or rope-way was thus formed between the slot-iron supports. As nearly all the weight of the traffic is on the rails, the tendency of the rails to go down is resisted by the deep girder, of which the heat tie forms the top and this continuous mass of concrete the bottom. There is no danger of unequal settlement. We give an engraving which shows a section of the roadbed with these piers. The soil in which the road is built is sandy.

In building this road, over 40,000 barrels of Portland cement were used for the concrete. There were 25,000 ribs or yokes used also. Of the steel channel-rail that forms the slot, about 1,000 tons were consumed.

The form of this slot-iron is peculiar. It is not an angle iron in the ordinary sense. The top part is 2 1/2 inches wide, and the inside or lower portion is 5 inches deep and 1/2 of an inch thick below the fillet. It is bolted on to the upright of the ribs. The upright parts of the two slot-irons are wider apart at the bottom than on top. The edges of the iron are 3/4 of an

inch apart at the top and 5 inches at the bottom, although only 5 inches deep, the slope being divided between the two. They slope back almost two inches in five. This gives room below for the straps on the grip.

By building the whole road on piers a very firm foundation was obtained, and chance of any settling obviated. If the street was dug away, this structure would remain on its 9,000 piers, like one of the old aqueducts. A double purpose was served by this. People wanting to make sewer connections or connect with water or gas pipes can do so without disturbing the road. They run all such connections between the piers, and even if careless workmen fail to make all solid again, the road does not suffer.

The Rail.

The rail used on this road is peculiar in shape, and is the same put in the California street railroad in 1877. The form was made specially for that road, drawings being furnished by the constructors to the Cambria Iron and Steel Co., of Johnstown, Penn., who made the first lot. Those on the road under consideration were made here by the Pacific Rolling Mills, from imported Bessemer-steel blooms. The rail weighs 33 pounds to the yard. It is a sort of combination T and street-car rail, the object being to get something that could be secured with a fish-plate joint. The rail is 3 inches wide, 2 inches of face and 1 inch of inner flange. It is 3 inches high. The main peculiarity is in the inner part of the T being dropped down to form the flat flangeway for the car wheels.

Carrying Pulleys.

Every thirty feet along the road is a grooved carrying pulley. These form the carriers for the rope. The pulley for this purpose is a solid casting, axle and all. It is 15 inches in diameter over the flanges, and 13½ inches in diameter to the bed of the groove where the rope bears. The axles are 1½ inch in diameter and 12 inches long. The bearings are 2½ inches long. A flange, or rib, is cast on the axle to prevent end motion, and it runs in a corresponding groove in the box. There are also 30-inch crown pulleys at the summit of each rise and 8 or 14-inch depression pulleys at the base of each hill. In some places the carrying pulleys are 6, 8 and 30-inch. The box in which each hearing sets is a lignum vitae block, set in a cast-iron shell, which carries the lubricant. The shells fit in a cast-iron frame, which rests on a small brick foundation in the tube or rope tunnel. There are two side walls that the edge of the frame rests on, leaving a clear passage-way under the pulley of some three inches. Each of these carrying pulleys weighs about 40 pounds. They last a long time and are seldom broken.

The Pulley Plates.

It is necessary to have these pulleys readily

latches into the recess formed by the channel iron, and holds the plate in place. The latch or dog has a weight formed on it, and hangs in the cast iron frame out of the way under the pavement. It is automatic in its action and

ROOTS PATENT GRIP.

cannot be disengaged by accident. The top of the plate has numerous rivet heads to roughen it and secure the truss and straps. The plate is subject to very heavy blows, so no rings or loose-lifting arrangement can be used. Two holes are bored in the plate, by which the hook

These pulleys, being above, would necessarily be in the way of the grip on the car, which is also above, if provision were not made to let the grip pass. This is by no means a simple problem, and more or less trouble has been experienced with those in general use. The depression pulley mechanism on the Market street road, the first of its kind used, has answered the purpose admirably. The depression pulleys are usually common pulleys, upon the underside of which the cable passes, and which are placed to one side and passed by a peculiar grip, or adapted to move in some manner that the grip may pass and then return to position. The method used on the first roads constructed here was to place the cable some distance to one side of the slot in which the grip travels. The grip was then made L-shaped so as to enable the shank to pass the depression pulleys, as the cable was carried by the grip at a fixed distance below the surface of the track. As the grip approaches these pulleys the cable is pressed down clear of them and the shank passes to one side of the pulley, the L forming an offset. This method is objectionable because the draft is to one side and causes a twisting strain of the shank. A grip with no offset, and passing down vertically without angle, cannot pass depression pulleys in the ordinary way. A different plan was therefore necessitated on this road.

At the proper position under the road-way is placed a horizontal arm, one end of which is pivoted or swiveled in a suitable manner near the slot-opening, and the other end of which carries a pulley. This is the depression pulley and holds the cable down. A counterpoise or weight keeps the arm and pulley in its place with relation to the center of the slot and over the cable. As the car comes along, the grip of course holds the cable down so as to press it out of the groove in the pulley. This leaves the arm carrying the pulley free to swing aside, but that is held by the counterpoise. The shank of the grip, however, begins to press against the side of this arm, near its hinged end, and without jar or shock presses the arm and pulley aside. The instant the shank has passed, the counterpoise brings the arm and pulley back to its central position again. As the car goes on further, the rope gradually swings back up to its normal position and comes into the groove of the pulley again. The frame or arm carrying this pulley is set at a small angle to the plane in which the grip-shank travels, and if any part should become broken, the weight or counterpoise draws the pulley and frame out of the way out of the line of travel of the shank, so there is no danger of any obstacle in the line of travel of the grip. There is no spring to get out of order in this arrangement. It must be remembered, of course, that cars can go only one way on the respective tracks of these cable roads, the cable running up one

or quite at right angles with each other. The means used for rounding the curve on the Market street road are different from those applied anywhere else, and deserve some detailed description. The curve on this road where the new system is applied is at the junction of Market and Valencia streets, in front of the engine house.

The main feature is in the use of an auxiliary cable in the curve on the line of the grip slot running at half the speed of the main cable. The two streets named do not meet at right angles. The Market street cable passes around its guide sheaves into the engine house, and that of Valencia street does the same. Between the end sheaves of these respective cables plies the auxiliary one, which carries the cars from one to the other.

The auxiliary cable is driven from a 6-foot, V-shaped iron wheel on the engine shaft. Guide pulleys suitably placed lead it out into its tube or rope way and back again.

In the curve it is guided by 15 side-bearing coned pulleys. The bases of the cones are downward, so that when the cable is within the jaws of the grip it is opposite the upper part of the conical face, and there is sufficient space for the grip to travel without touching the sheaves. When the cable is released from the grip it may settle to the lower or larger portion of the sheave-face. The auxiliary rope is 400 feet long, and the curve has 80 feet radius and about 55 degrees of angle.

The auxiliary cable only runs between one pair of tracks, and propels the cars only from Valencia street around the curve into Market street. It happens that at that point the grade is such that the cars coming from the ferry, when they let go the Market street cable, will run by gravitation around the curve to the point where they can take hold of the Valencia street cable.

On the return, however, they are on the up-grade, and there an auxiliary cable comes into play. A slight bend or turn in the track out of its regular line swings the car and grip to one side, so that the cable passes out of the side of the grip from between the jaws. The momentum of the car carries it on a few feet to the point where the auxiliary cable is running, and this cable passes into the side of the grip, the jaws of which are open to receive it. By the proper movement of the lever by the gripman the grip-jaws close on the cable, and the car is drawn around the curve. As it reaches the end of the auxiliary rope, another curve or swing in the track swings the grip away from the rope, the jaws being opened for the purpose. The momentum of the car carries it a few feet to the point where the grip may take hold of the main line cable, and continues on its way. The cars have only a space of about eight feet to travel by momentum. The distance they

SECTION OF ROAD-BED SHOWING FOUNDATION PIERS, TUBE, PATENT CAR, ETC.

accessible, so, over each one is a removable plate, which it took some ingenuity to devise, since the plate must be secure in its place, must form no obstruction to traffic, and stand heavy blows, and at the same time must be constructed so as to be taken up readily for oiling the pulley and cleaning the rope-way. The plate is twelve by sixteen inches and of flat three-eighths wrought iron. The under side, running lengthwise the center, is a channel-iron truss for the truss straps, three of which cross it. One end of this channel-iron truss projects past the plate, and dips into a recess in the cast iron frame. The other end comes flush with the plate, and a cast iron hook or dog drops or

is disengaged and it is lifted. The pulleys can then be oiled. The tube is also cleaned out through these openings. A man with a peculiarly-shaped shovel or hoe, operated through the grip-slot, pushes the dust and dirt to the opening, where it is readily removed. These plates, complete, cost about \$2 apiece.

The Depression Pulleys.

It must be remembered that in these cable roads, in addition to the carrying pulleys below, which prevent the rope sagging, there must be also pulleys provided at the crossings of upgrades to hold the traveling cable down below the surface of the street and within the

track and down the other. The grip always comes one way, and as the arm is set at an angle with the slot and partly crosses it, the grip shank must come in contact with it just at the right time and push it aside. The arm is about six feet long. This an ingenious arrangement and is at the same time both simple and effective. We have now to consider the method of

Rounding the Curves.

There are several mechanical difficulties to be met with on the curves of cable roads, especially where they have to pass around those of 90 degrees or more, with a radius now commonly used in cities with narrow streets nearly

travel on the auxiliary rope is about 120 feet.

The auxiliary cable travels four miles an hour—just half the speed of the main-line cables, and the tension of it is much less than that of the main cable, as it only has to move one car at a time around the curve, while the main cable has the strain of all the cars which are running on the various grades of the whole line. The tension being so much less, it is easy to relieve the grip from the side strain and prevent undue friction and wear in passing curves.

At proper points on the road-way are iron plates with block letters, with the words "let go," "stop," and "take rope," so that the grip-

man will know exactly where to manipulate the grip and brakes. At night the big headlights show these plates plainly.

Switch and Safety Arrangement.

Just before the curve at Valencia street is reached, the cars which are to go out this Haight street branch switch off from this main line to the right. There the Market street cable has to be dropped while the car goes around its curve in switching on to the Haight street cable, which, as before explained, is a separate rope entirely. The switch is so arranged that not only the rail but the grip-slot is set for the car as it goes around the curve. It was found that sometimes the grip-man was careless, and did not let go the cable in time, so that as the car started around the curve the cable kept carrying the grip straight ahead on this main line. The consequence of this, as might be expected, was a broken grip, and sometimes a cut cable. It would not do, therefore, to trust entirely to the gripmen at this point, and arrangements had to be made to provide some sort of safety apparatus, so in case the cable was not dropped no breakage could occur.

A switchman stands at the switch, to move the lever which throws over the guide-rail and slot-iron for turning the car off the main track. The same movement that does this also works the safety apparatus, some 30 feet away.

Connected with the switch-lever, by bell-crank, is a long shaft. On the side of this is a pin carrying a roller 6 inches in diameter and 8 inches long. This shaft is at one side of the rope tunnel or tube. The roller stands in an upright position—to one side and out of the way of the main-line cable and grip—when the Haight street switch is closed. The main line is then clear for the passage of the grip, without releasing the rope. When the switch lever is moved, however, the shaft is revolved by the same motion, throwing the roller down on top of the rope and pressing the cable down out of its straight line. The top of the roller is then lower than the bottom of the grip, so the grip is free to pass over it, provided it has released the rope.

When the car comes along, if the grip has dropped the cable, it passes on around the curve all right on to Haight street, on a slightly descending grade. In case, however, the cable has not been released by the grip, the cable draws the roller up and revolves the shaft which awings the bell-crank on the switch end of it, closes the switch, and compels the car to keep the main line. Of course then no grip can be broken, because the car keeps on the same line as the cable. The car is then stopped, backed up, and moved around the curve, where it should have gone in the first place. The fact of its having gone on down the main line is, of course, proof that the gripman neglected his duty, and several repetitions would prove his inefficiency and cause loss of position. It makes the men careful, therefore, at this point. Still, the safety arrangement always stands ready automatically to correct any such fault, or at least to prevent breakage and detention.

As the car return from Haight street to the main line they let go the Haight street cable, which passes off to the right around a guide pulley, crossing the street to the engine house. The car run by gravity around the slight curve on to the main track. Here the main Market street cable must be picked up, and an ingenious arrangement has been devised for this also.

It will be remembered that the grip is a side-hold one—that is, the cable goes in at the side to be caught by the grip. Therefore, if the rope were raised up vertically at this point it would strike against the bottom of the grip and prevent its being raised.

The rope, of course, when dropped by the grip falls into the supporting pulleys, which are below the level of the grip, so the cable must be raised until the grip can take it. The lifting arrangement or gypsy consists of a cross of inch and a half gas-pipe, one end of the head of which is hinged to each yoke of the roadhead frame. No guides are needed. The pipe projecting from the cross carries a conical roller six inches long, six inches in diameter at one end and two and a half inches at the other. A chain from the end of this pipe comes up to the surface of the street. The conductor leaves the car and pulls on the chain. This raises the pipe and roller, and the conical roller striking against the rope not only raises it, but causes it to describe a sort of half-circle, drawing it to one side so that when all the way up it slides back down the small end of the roller into the side of the grip between the jaws. It is then grasped by the grip and the car goes on down the line. This arrangement answers the purpose perfectly and is very convenient. The cost of construction was trifling.

The Turn-Tables.

At the ferry-house, foot of Market street, the cars are turned around, so the open portion

carrying the grip will be ahead. This turn-table is on the wharf, over the water, and the 10-foot pulley (or tail-sheave, as it is called), around which the cable turns is just beyond it. A slight raise in the track is made at this point, so as to give a down grade on the way back, for a short distance. (See engraving, page 45). As the car comes down the street the cable is released from the grip, by a slight bend in the track taking the car out of its line. The momentum of the car carries it on to the turn-table, which is 30 feet in diameter. There are four sets of tracks, one for the incoming car and three for the outgoing. The Valencia street car is shifted to its side-track, the Haight street car to its track, and the McAllister goes on a track prepared for it. These three outgoing tracks merge into the main line a short distance from the turn-table; but by having the three side-tracks, the cars for the respective routes may follow each other quickly. Being on a grade, the cars are readily pushed to these tracks, and run by gravity a few lengths, to where they grasp the cable running up Market street. The grip does not have to be raised while the cars are on the table or side tracks.

There are two tracks on this table, so it can be turned and transferred by them at the same time. By having the double tracks, when one car comes on and is turned around, headed for its side-track, the other pair of tracks of the turn-table is in position with relation to the main track, so the incoming car can come right on. The table has, therefore, never to be turned back. Between both tracks there is a slot and tube-way for the grip, forming a continuation of the incoming and outgoing tracks, into which the grip passes, and passes out of

tion, on Haight street, midway between Shrader and Stanyan streets, about two hundred and fifty feet before the terminus is reached. The depot is a two-story structure—ons floor only, however, having been built. Provision has been made for the second floor when required. There is a grade of three and a half feet in one hundred on this road at this point, so that the cars are run in on a Y, run by gravity from the main track to the house; and go out by gravitation, also, on the other fork of the Y to the main track again. A spacious car-house has also been constructed on the McAllister street block, opposite the engine-house, for the accommodation of the cars of that line.

The McAllister street car house, on the opposite side of the track from the engine house, capable of holding 44 combination cars, is so constructed that a second floor may be added at any time, which will be the case at no distant day. The main body of this car house is 70x122 and there is a wing of 74x107. The Valencia street depot is built to hold 78 cars on each of the two floors. The Haight street house has room for 44 cars.

The general design of the whole road was made by Mr. Henry Root, who also designed and constructed the California street hill cable road. Many of the appliances and devices in use on the road were invented by Mr. Root; notably, the cars, grip, tension apparatus, roadbed, depression pulley, etc. All the details were arranged under his immediate supervision, and the road is operated under license from him. The road is a first-class engineering job, and superior in its details to any heretofore built. The officers are: Leland Stanford, president; Chas. F. Crocker, vice-president; N.

when the road is opened to street traffic before the concrete is properly set, or because the concrete is deficient in quantity at the bottom and sides of the tube. This occurs in spite of the heavy and expensive wrought-iron ribs used to stiffen them in cross section. Hence, the natural inference arises that the tube and slot are really held in shape, not by the ribs, but by the concrete. An examination of the ribs would indicate this without the observed facts, as the ribs are weakest at the bottom, where they should be strongest. Further, these ribs are not only an unnecessary expense, but they really weaken the roadbed by cutting the concrete up into slices of three to four feet lengths.

The above considerations form the basis of the "Isaacs method of construction." By dispensing with ribs the tube can be built much more cheaply and expeditiously. The ironwork used in the roadbed is only in the upper surface of the concrete, and consists of short sleepers, to one end of which are riveted gussets or angle plates, and to the other the attachments for holding the rails. Near the center a key piece is riveted for holding the sleeper firmly in the direction of its length. The gussets hold the slot irons rigidly in place, and keep the slot from opening or closing. The gusset is shaped so that the thin way comes in a joint of the paving, is kept low, and cut angling so that it cannot be struck by wagon wheels as the paving wears. As an additional security the sleepers are anchored in the roadbed with stout bolts, which are riveted over the nuts after the concrete is set.

By adopting the section of tube shown in the cut, acute angles in the concrete are avoided, which renders it much less apt to spall off and

J. D. ISAACS' PATENT CABLE ROADBED.

The Isaacs Method of Building Cable Roadbeds.

The object of this article is to introduce to the reader what is considered to be a greatly improved and at the same time very economical system of building the roadbed or tube of cable roads. The foremost consideration in a cable road is the tube. It has always been the object of cable road builders to so construct this that it shall be permanent in character, reasonable in cost, and so that the grip slot shall neither close nor open under any circumstances, but remain as first constructed. Doubtless the faulty construction of the Philadelphia tube, and the consequent closing of the grip slot, has deterred many companies from putting in a cable road. The inventor of the Isaacs method claims to have accomplished all objects essential to a good and cheap cable road tube, as will appear in the context.

The objections to the use of cast-iron ribs or yokes and wooden lagging to fill in between are many. The yokes are constantly broken under ordinary street traffic. The joints in the wood-work allow sand and dirt to sift into the tube. The wood decays so rapidly as to require renewal in about four years. The cost of keeping the roadbed in repair and the paving up to grade is very heavy. These objections seem to dispose of the use of cast-iron or wood for cable roadbeds, leaving only the combined wrought-iron and concrete to be considered.

Tubes heretofore built of concrete have given more or less trouble from closing of the slot

fall into the tube—a matter which has given some trouble in other tubes—and which also furnishes a firm support to all the paving blocks without the makeshift of a piece of boiler plate under those next the slot irons, to keep them from tumbling into the tube. In other concrete tubes the molds used have been in short sections, troublesome to keep in place and difficult to get out of the molded tube. By a method devised for this system the tube molds are made in long pieces, and are so constructed as to come apart and be pulled up through the slot, before the slot irons are finally fastened to the gussets. All iron used is of such section that it can be rolled by any rolling mill in the United States.

If it should be necessary to dig under this tube for water, gas or sewer pipes, the tube, from its shape, forms a strong self-supporting girder capable of carrying its load for a considerable span without giving way. When it is necessary to support the tube with piling in made ground it is also a strong shape for that purpose.

Guide pulleys for carrying the rope (not shown in the cut) rest in cast or wrought iron frames held in recesses molded in the sides of the tube. These are placed at proper intervals, and so arranged as to be perfectly accessible from manholes for oiling the bearings or removing the pulleys.

It is claimed that the cost of this mode of construction is from one-third to one-half that of other first-class tubes, and much less than cast-iron combined with wood or wrought-iron combined with boiler-plate, and is, when finished, an unperishable piece of work which will neither deteriorate with time nor disintegrate under traffic or changes of temperature. Those desirous of further information or details may obtain them by addressing E. H. Marwedel, 541 Market street, San Francisco, Cal.

The Park and Ocean Railroad.

One of the most important results following the building of the Market Street Cable Railway with its branches running out Haight and McAllister streets, has been in making accessible the Golden Gate Park and the ocean beach. Before these roads were built only the rich were able to use the park, but now for five cents people are landed at the park gates by either line. The public has since taken greater interest in Park matters, and the park itself has been greatly improved. There are now 100 visitors where there was formerly one.

What was formerly a barren waste of sandy dunes has been converted into a beautiful resort, with smooth, broad drives, secluded nooks, pleasant walking paths, etc. The plants and flowers, brought from all climes, thrive wonderfully and are the admiration of all visitors. The magnificent conservatory with its wealth of

the originators of the Market Street Cable Railway Company. It runs from the Park direct to the beach and is one of the most popular lines of travel on the Coast. The cars are large and exceptionally well lighted and ventilated. They are on low trucks, but are as wide and long as an ordinary passenger coach on the overland roads. The seats are arranged similar to those in passenger coaches, and there is plenty of room for each passenger. There is no appearance of a street car about these vehicles at all. The windows extend to the top and are wide so that all can have a fine view in every direction.

Powerful steam dummies draw these cars at a rapid rate over a smooth and well-built road, with the rolling brown sand-dunes on one side of the track and the beauties of the park on the other. The line runs parallel with the edge of the park to the ocean. It then turns to the right and passes along the upper edge of the ocean beach until it reaches the foot of the bluff near the well-known Cliff House.

Along this part of the line a magnificent view is unfolded. The foaming breakers form a long white fringe for miles to the blue ocean spread

the waters around are filled with these curious beings, who drown the sound of the surf with their hoarse cries. Visitors never tire of watching their gambols. On the hill back of the Cliff House many improvements are being made and pleasure resorts are being arranged.

Thousands and thousands of people visit the seaside now weekly, but the railroad arrangements are such that the crowds are easily accommodated. At each end of the line are well-built and convenient depots, and the incoming and outgoing people are kept entirely separate. The tickets are purchased as the depot is entered, and on passing through a door the tickets are each deposited in a box, so there is no further care on the part of the passenger. Everything is clean and roomy, and the arrangements are such that the comfort and convenience of the passengers are carefully looked after.

The Cable System Abroad.

Thus far the cable system of transporting street cars has not been extensively adopted

the tube the length of the curve. The engine is placed at the top of the hill.

An extensive system, covering some forty miles of street, is now under construction in Melbourne. The city issued \$5,000,000 of 4 per cent bonds for the construction of this system, which has been leased to the Omnibus Company for 6 per cent upon the cost, the city fixing the fare at 6 cents between any two given points. This will be the most extensive system of cable railway ever constructed, and great care is being taken to make it as perfect as possible. An engineer was sent to San Francisco, who examined carefully all of the cable roads of this city, and who will take advantage of the experience of the construction of the roads here.

A double track road two miles in length is also being constructed in Sydney.

These Australian roads are being built under the Hallidie patents, which were taken out in that colony.

The city of Edinburgh has already entered into a contract for the construction of cable lines there. The city of Glasgow is negotiating for a similar construction there. In Liverpool they are about to change their gauge from 4

PROFILES OF LINES OF CABLE RAILWAYS IN SAN FRANCISCO.

plant life one never tires of visiting. The lawns are smooth and well trimmed, and trees planted in every direction shelter the place from summer winds so that the old resident can hardly believe that such a spot could be so near the city.

Summer-houses, rustic seats and other conveniences have been constructed, and the Park has been beautified by fountains, statuary and other embellishments until it is now a place that San Franciscans can be proud of. On certain days a fine hand discourses choice music for the multitude of visitors. Before the cable railways were built only those who had carriages could conveniently visit the Park, while under present circumstances it is accessible to all.

Perhaps even a greater result has been attained by the same means. While San Francisco is a sea-port town, it is on the bay shore some eight or ten miles from the ocean itself, and thousands of its citizens never had a chance to see the breaking of the Pacific surf until after the completion of the cable roads. When the Haight street line was finished to the Park it became possible to reach the ocean beach in a few minutes by means of a connecting line, and at an expense of five cents more.

This connecting line is called the Park and Ocean Railroad, and was projected and built by

out before the observer, and off in the distance are the ships and steamers coming to and going from the Golden Gate, rolling and tossing on the great waves of the bay. Way off to the northwest are the rocky shores of Marin county, on which the mighty surf of the Pacific is thundering. Point Reyes and Point Bonita, where the light-houses shine out at night, are within ranges of vision and all along the Coast between there are seen the white sails of the fishermen, who frequent those waters.

As the car rolls smoothly on groups of pleasure seekers are seen wandering along the beach, enjoying the ocean breezes and the freedom of their surroundings. The unceasing surf thunders its welcome, as it breaks in foam on the bleached sand and runs far up the beach until its energy is expended. Close by is the United States Life Saving station, where the large surf-boat is an object of curiosity to all.

At the end of the line is a handsome station, largely enclosed in glass and clustered around it are hotels, restaurants, a gravity railroad, and various places of amusement for visitors. A short walk brings one to the foot of the cliff, and a few hundred yards further is the famous Cliff House, from which point a magnificent view is obtained. Close by are the well-known Seal Rocks covered with seals basking in the sunshine, while

abroad, though it has been tried in a few places. The Highgate road in London is about 1½ miles long, and was rather difficult to build. Part of it is a single track, on a very narrow road, and part is a double track. The line is on a very uneven grade, and is tortuous, having several curves in it. This road was built from designs prepared in San Francisco.

The Koslyn tramway, in the city of Dunedin, New Zealand, is a cable railroad, 3' 6" gauge, single track, with turnouts. It is 3,500 feet long, and ascends 500 feet in that distance. It has two curves, both on grades.

This road has been operating about five years, under the patents granted to Mr. A. S. Hallidie in the colony of New Zealand.

The peculiar features of this road are:

1. Single track line, with two turnouts or sidings, both parts of the rope running in opposite directions in one tube, except at the turnouts.

2. Two curves of 215 feet radius, forming an S.

3. Absence of level crossings, thus requiring stoppages to be made on the grades.

At the curves, horizontal rope sheaves are placed in the tube, and the shank of the gripper is provided with a roller, which rests against a rail placed parallel to the track and slot inside

feet 8½ inches to 3 feet 6 inches, and they propose at the same time to change their system and put down the cable system. Other cities, Sheffield, Manchester and others, are moving in the same direction. A franchise has also been granted to the Cable Tramways Company to build underground railways in London, and to connect those now operated by steam by the cable system underground. The present system of operating the underground railways is by steam motors, and the result is that the tunnel is filled with gases, and while the people are compelled in order to save time to employ that mode of transportation they would not adopt it from choice, because it by no means adds to their health. It is now proposed there to introduce the cable system, and to run the cars at about eleven miles an hour, including stops, which is about the speed on the New York elevated railroad, and about equal to the present speed of the several subways in London. That will remove all objections to the underground road in respect to gases, foul air, ventilation, etc. If that is applicable to subways it is equally applicable to elevated roads. It is intended to expend on this conversion in the subways of London somewhere from £7,000,000 to £10,000,000 sterling.

The Sutter Street Railroad.

The cable system of operating the Sutter street railroad in this city was introduced on the section from Sansome to Larkin streets in January, 1877.

The Larkin street section from Sutter to Hayes streets was built and operated the latter part of 1878.

The Sutter street line was extended from Larkin street westerly to Central avenue in October, 1879.

From January, 1877, to December, 1883, the road was operated by two plants of machinery; one located at the corner of Bush and Larkin, operating Sutter street from Sansome to Buchanan street, and Larkin street from Sutter to Hayes. The second plant was located at Sutter street and Central avenue, and operated the line on Sutter street from Buchanan street to Central avenue.

The track is about five and a half miles of double line, of which some three and a half miles is operated by cable.

In 1883 it became apparent that the proper operation of the line demanded better motive

operate its uncabled portion of the road.

Its cross town road, at right angles with the Sutter street line, and the system of transfers employed, gives a vast scope of territory for feeding the general carrying trade, and promises with contemplated extensions of cable plants to place the company in the foremost ranks of street car operations.

Its machinery is ample and six boilers are in readiness to supply steam to the engines now in use, while the foundations are laid for the reception of additional engines at any time. The draft of furnaces is superior, the tall chimney of 165 feet from the sidewalk being of a style to promote combustion, and insure fires of intense power. The water injected into the boilers is nearly at boiling point, and this is accomplished entirely by the utilization of exhaust steam, thereby promoting economy and efficiency. Its fire room is as cool as the main office of the company, being well ventilated and kept at a low temperature. The line new engines which furnish power on this road were made in this city by the Union Iron Works.

SAN FRANCISCO THE FIRST.—A good many ideas of wire-rope transportation for city streets had been advanced from time to time, and the systems patented; but none of them were put

New York's Mistake.

We notice by the New York papers that the horse railroad people have finally succeeded in securing control of that great thoroughfare, Broadway, and have the horse cars already running. These cars, although running under about one minute's headway, are packed with passengers, as many as 125 deposited on one car. This means poor accommodation for the public and death to horses.

How much better would have been a cable road such as we have on the principal streets of this city. The grip and passenger car would take up no more room than the horses and car of the ordinary road, and would carry three times the number of passengers. The cable car is handled with greater ease in a crowded street than a horse car, running slow or fast as may be desired, and can be stopped almost instantly. With all of these advantages, besides being operated at from 30 to 40 per cent less than horse cars, it appears very strange that this successful mode of carrying passengers should not have had preference over the old horse car system which is being rapidly abandoned here. It is claimed that the horse car makes less noise than

and the rope is deflected by means of two 8 feet diameter horizontal pulleys. The streets descend from both directions towards the curve, and about 30 feet before reaching the curve the grip is opened and released from the rope, the car and dummy are carried around by gravitation, and the rope is picked up again after passing the curve. This road has the steepest grades of any in the city.

The Geary Street Cable Road.

This cable railroad is built very much like the Sutter street, but the line is straight from end to end; that is, it has no curves. No depression shaves are used on this road to keep the cable down, as the angles at changes of grade are very slight.

The Geary street railroad runs over a comparatively level street, and through the most central and populous streets of the city. It was completed and commenced running March, 1880.

The gauge of the road is 5 feet and its length is 13,200 feet of double track, in which distance it passes over two elevations, 350 and 280 feet above sea respectively, and attains a third

CARS AND DUMMIES OF THE SUTTER STREET CABLE RAILWAY.

power, and the company, at great cost, purchased the 50-vara lot situated at the southeast corner of Sutter and Polk streets, and prepared the same for occupation, by excavating a large basement for machinery some 14 feet below the surface, and erecting a brick building covering the entire ground, and three stories high, amply sufficient in all respects to meet the requirements of future business for a life time to come.

There are 40 cars in use. The car seats 18 and the dummy 18 more. The engraving shows their general appearance. The gauge of the track is five feet, and cable crosses two of the main thoroughfares of the city—Kearny and Montgomery streets. Their main cable line is on Sutter street, and is 13,291 feet long. A branch cable road runs at right angles to this on Larkin street. This latter road runs across two other cable roads, viz., the California Street and Geary Street Railroad Company.

The gripping attachment used by this company is somewhat different in construction from that on Clay street, although involving the same principles. The motion of the gripping jaws is vertical instead of horizontal, and it takes and releases the rope sideways, instead of beneath, as with Clay street; and in order to run on to or off from the rope at the termini of the cable road, the track and slot diverge from or converge to the line of the rope. Levers are used for operating the jaws instead of the screw. The differences in this road and other cable roads in this city are noted in the article on "Cable Railway Propulsion" in other columns of this issue.

The company repair, construct, paint and equip its own rolling stock. Besides the cable power employed, it requires some 140 horses to

to practical and successful work until the Clay-street hill road was first operated in this city in 1873. Since that time there have been built here, on the cable system, the Sutter street, Geary street, California street, Presidio, Market, Haight and McAllister street roads. The system has also been introduced in Chicago, Philadelphia, New York, London and Dunedin, N. Z. As each successive road has been built, improvements in details on the general system have suggested themselves and been adopted. On some roads the conditions have been different from others, and these peculiarities necessitated greater or less modifications, according to their nature. Being a comparatively new field of engineering, there was, of course, much scope for inventive ingenuity, of which practical men have availed themselves. Inexperienced persons, too, have conceived ideas about cable roads, many of them quite startling in their nature. In fact, numerous patents which have been granted will be of very little use from their impracticability. At the same time improvements in detail to simplify and perfect have been made and adopted, so that now many of the obstacles and difficulties first met with have been removed.

THE Tacoma Coal Company has found by tests made by several blacksmiths that they have a vein of coal which compares favorably with the Cumberland blacksmith coal. All blacksmith coal is brought from Pennsylvania, and commands a big price.

The pay-rolls of the Comstock mines during the month of June was \$12,000 in excess of the amount paid in May.

the rumbling omnibus. With the cable car even less noise is made, and the clatter of the horses' hoofs would have been avoided. In addition to this the cable car would have been an advantage in a sanitary point of view, as the street would have been clear of the voiding of two or three hundred horses. The horse car as a rule is splattered with mud from the horses' feet, while the cable car is always clean and inviting.

The Presidio and Ferries Cable Road.

The ride over this road is a very pleasant one. When that portion of it near North Beach is reached there is a fine view of the bay, and after reaching the summit of the hill and starting down the hill a scenic panorama unfolds itself. One may see the Golden Gate and far beyond to the ocean horizon. Many persons ride frequently on this road for the view alone.

The Presidio and Ferries Cable railroad has a 5-foot gauge; 10,000 feet of double track. It ascends one hill 246 feet above its initial point in a distance of 5,000 feet. The engine is located on the summit of the hill, about midway between the termini, and about 700 feet from which is a very heavy grade of 78 feet in 412, or 1 in 5.3. The road is built very substantially, with cast iron sections or yokes, connected by rolled channel iron and sheet iron.

The grip is the same as the one used on Clay street, although made heavier to conform to the heavier grades and rolling stock.

There is a curve at the intersection of two streets, about 2,600 feet from the starting point,

elevation at its west terminus of 224 feet above sea, its starting point in the city being 35 feet above base and the two intermediate valleys being 160 and 154 feet respectively.

The tube is constructed of cast-iron sections and covered by concrete. The space inside the tube is much less than any other of the roads. The grip is worked by levers. It is vertical in its motion and takes the rope from above, the gripping jaws being immediately under the slot, as is also the rope, which is thus exposed to the falling water, dirt, etc., which the other roads avoid by having the gripping jaws and rope sufficiently off on one side of the slot to escape falling particles.

THE rope on the tube in cable roads is carried on freely-running supporting pulleys and especially constructed depression pulleys are used for holding the ropes down at the cross streets, on grades where the angle changes. The rope is run at a speed of from five to eight miles per hour, and the cars run at equal speed on a level or up or down the hills.

RICH placers have been known to exist from time immemorial in the Soledad Canyon, Monterey county, but until recently very little has been done to develop them. Now dry-washing is being done extensively on the Happy Thought mine, near Alpine Station, with flattering results. The average yield is an ounce of gold to the ton.

A PIECE of quartz gold weighing twenty-four ounces in gold was sold in San Andreas, Calaveras county, last week.

The Rasmussen System.

One of the ingenious devices for adapting propulsion by an endless wire rope to passenger travel is the invention of Mr. Charles W. Rasmussen, of Chicago, whose patents are now owned by the United States Cable Railway Company of Chicago.

There is no grip, consequently there is no need of "dummies" or "grip cars." The cable does not run over fixed pulleys, but is carried along by small trucks, to the axes of which it is firmly clamped, there being a pair of trucks to every sixteen feet of cable. These trucks run on rails that are rolled or spiked on to the lower plate of a rolled iron tube. This tube consists of three pieces of iron, rolled according to pattern, two being angle iron, forming the sides and bolted on to a bottom plate, a five-eighth inch slot being left in the top, the whole forming a tube 6 inches wide by 9 inches deep, which carries the cable and trucks. This tube is firmly bolted on to the ties of an ordinary horse-car line between the rails, and thus necessitating an excavation of only 9x6 inches instead of the usual trenches of 5 feet by 4 feet, and during the time occupied in setting a tube between the rails the traffic is not impeded with the tubing on this ground (that is strung along the line as you would water or gas-pipes). It is estimated that with fair laborers a mile a day can be laid.

By avoiding the necessity of digging the large trenches a great saving in first cost is made, and any line now operated by horses can be converted into a cable road without stopping the usual travel. In the construction of an entirely new line any style of roadbed foundation can be used.

Any ordinary horse-car can be easily converted into a cable-car by merely attaching thereto, under the body of the car and to the supports of its trucks, two revolving drums, one at either end, over which moves a flat endless chain, just 48 feet in length. Fastened to this chain are three stout arms or pins, just 16 feet the one from this other, and so arranged that there is always one pin in the slot of the tube, and immediately in front of and touching the axle of one of the small trucks. The whole is controlled by the driver or operator, who works an ordinary car-brake on the front platform. A turn to the right stops the car; a turn to the left starts it. The action of the revolving drums is such that the car can be started or stopped very gradually, or can be run at any desired rate of speed up to the full speed of the cable. When the brake is turned so as to release the drums and allow them to revolve, the car will stop, and so long as the car is still the drums continue to revolve, but as pressure is put on to the drums, and as they gradually cease to revolve, the car gradually commences to move. Should an obstruction occur on the line and the cars become backed, they can, as soon as the obstruction may have been removed, start the first car off at full speed, the next at a lesser speed, and so on until all the cars shall have assumed their regular distances apart.

Should a fire hose be across the track these cars will be able to pass over it by the same bridge as now used by horse cars, the grip not being in the way, as there is none. Furthermore, should the obstruction be of a nature to continue for hours or all day, as sometimes happens when a house is being moved, the cars coming from either end of the line will run up to the obstruction and be switched from the up to the down track and from the down to the up track by means of small portable turn-tables, such as are on hand in all car houses, the passengers in the meantime walking around the obstruction, where they will find a car ready to carry them on.

Corners are turned by means of an auxiliary cable which derives its motion from the direct cable, transmitted by a system of drums working on bevelled cogs. At the engine house the cable with its attached trucks goes in and around the usual system of drums and back to the street, the drums being grooved so as to allow the trucks to fit snugly, and as every truck enters the engine house it is automatically oiled before it goes back to the street.

The tube is kept clean by means of scrapers and brushes attached to the trucks at regular intervals, which carry dirt and slush to openings where solids are deposited in a catchment basin and fluids go into the sewer. These catchment basins are 300 feet or more apart and easily cleaned.

As a long description in detail without the assistance of diagrams would be tedious and unsatisfactory reading, we will defer that until a future time, when diagrams will be used.

Some of the advantages claimed by the inventor for this system of cable roads over all others, are:

The existing track is available throughout, no change being necessary.

No interference with public traffic, and no loss of revenue is caused during construction.

The sewer, gas or water pipes are in no instance disturbed.

Only one manhole for each 300 feet of double track is used, and there are placed between the up and down tracks where there is the least traffic.

No extra grip cars or dummies are required.

The operator stands on the front platform, enabling him to see passengers and avoid accidents.

One hand-wheel operates both grip and brakes.

The cable is always in direct line, and there is no downward strain on the car.

No watchmen are required at sections; the car connects and disconnects automatically.

The cable is not gripped and will not get stranded, and will last seven or eight years instead of seven months.

The cable receives no extra wear from either starting, stopping or by the car traveling at a less rate of speed than the cable.

Any man who can turn an ordinary hand-wheel is sufficiently skilled to run the cars.

Taylor's Endless Chain Grip for Cable Roads.

The engraving given herewith shows a new style of grip for cable railroads (now becoming so popular), which is ingenious and simple in construction. Various styles of grips have been invented and described in these columns. Several modifications have been tried of the so-called solid grip, which is simply an iron vice,

TAYLOR'S ENDLESS CHAIN GRIP FOR RAILROADS AND OTHER PURPOSES

with one jaw upon one side of the continuously moving cable, the other jaw upon the other side, with each jaw having a semi-circular groove, the jaws made to approach and recede from the cable, for the purpose of stopping and starting the car.

Roller grips have been tried and abandoned, because the contact of the grooved rollers is so small upon the rope, that so great pressure is required to prevent slipping, that the cable is soon injured. The effect of the roller grip upon the cable is like the rolling of round bar iron between grooved rollers. The solid grips have been made of iron and other metals, and even with wood linings; and this style of grip is about the only one in use now, for want of something better.

This ingenious grip which is here described was invented by Mr. H. R. Taylor, of this city, and is specially designed to prevent the

wear of the cable by transferring the wear (consequent upon a continuously moving body being made to move or overcome the inertia of a body at rest), to certain parts of the grip, which parts can be quickly and cheaply replaced. The cut does not need much explanation. This cable is shown at E. The wheels B are enveloped by an endless chain A. The links and chain are square. The inner flat-edge runs upon the rollers B, which of course are turned flat to receive them. The outer portion of the chain conforms to the circle of a section of the cable; and the chains, one above and one below, or one at each side, always move with the cable when in contact with it. Between the rollers B, and at the back of the chains are placed lugs D, which by the mechanism that opens and shuts the grip, are made to press the chains upon opposite sides of the cable, and at this point or upon the surface of the lug and inner side of the chain is the friction and wear. The chain and lugs are cheaply replaced, and the expensive cables allowed to move and run for a great while unharmed.

The further advantage of this style of grip is

nearly to their outer edges, are covered with iron plates to keep out sand and dirt. One of the iron plates is removed from lower half of the drawing to better illustrate where the friction and wear is.

Mr. Taylor invented this and secured letters patent in 1876; also in the last year in this country and England. It has been examined and admired by many engineers and mechanics and scientific gentlemen.

The question might be asked: Why has not this grip, for which so much is claimed, been in use here long since? Mr. Taylor answers this as follows: "A ready answer can be found in the fact that every engineer here and at the East, who has built a cable railroad, has a grip of his own, which he desires to bring to a practical use, to the exclusion of others."

The time is at hand when cable railroad companies are looking for some device which will prevent the enormous wear upon the expensive cables. This grip can also be used to advantage as a brake to a mining cable, such as hoisting works for mines, etc. A model of Mr. Taylor's grip can be seen at his office, 120 Market street.

A PROPOSED CABLE ROAD.—A meeting of the Church-street Improvement Association, of this city, was held this week. In a stirring speech upon the progress of the club, and the many improvements recently made along this line of Church street, J. J. White moved that the Club, in order to facilitate the building of a cable road over the street, depend no longer upon the hope of interesting capitalists or any railroad company, but take the initial step by organizing as a company, and after grading the street build the road with its own capital. The suggestion was received with great favor, and the resolution was passed unanimously. The speaker stated that there were nearly 200 members in the Club, and all being property-owners, if they handed themselves together they could build and run their own road. This would be more advantageous to the Church-street people than if the road was built by outside capital. In conclusion, Mr. White urged that no time be lost in this consummation of the project. This was in accord with the sentiment of the association, and it was decided that at the next meeting active steps would be taken to organize and go to work.

The saving effected by the employment of the cable system in Chicago is from thirty to fifty per cent. on that of horse roads, while its capacity for traffic is almost unlimited. The speed at which the cars travel is from 6 to 10 miles per hour.

Another line called the Mornington has recently been built in Dunedin, N. Z. It is one mile and a half long, and is constructed under the Hallidie patents.

Fig. 1.—Peterson's Rotary Safety Guard for Street Cars.

Peterson's Safety Guard for Cars.

The object of this invention of Mr. L. Peterson, of 258 Market street in this city, is to prevent such accidents as are of frequent occurrence in cities, occasioned by persons being killed or injured by street cars.

Fig. 1 is a perspective view of the invention, in which the roller extends across the front of the car, or in the case of cable roads it would be attached to the front of the dummy. The roller shown in this view is made with plain corrugations extending lengthwise of the roller, the corrugations being

formed by putting on strips of rubber to act as cushions or fenders.

Fig. 2 shows a modification of the invention—the rollers being placed in an angular position in the manner of a cow-catcher—so that any object with which they come in contact will not only be brushed forward by the rotation of the rollers, so that it cannot get under the car wheels, but will also be forced to one side or the other out of the way. The meeting ends of these two rollers are supported on a frame; under the forward point of this frame is a small wheel which rests or rolls upon the roadbed, or upon the slotted iron rail when the attachment is made to cable cars. These rollers are shown on a dummy, such as is used on cable roads.

In this view is also shown a modification of the

Fig. 2.—Peterson's Guard for Cable Dummies.

surface of the rollers, which consists in rows of rubber plugs or buffers inserted in the rollers, and projecting sufficiently for the purpose required.

These guards may be so constructed as to adjust themselves automatically to any inequality in the roadbed, and so maintain their proper distance from the track, which is usually from one to three inches.

The rollers do not touch the roadbed, but run close to it. They are adapted for either horse or cable cars.

The guards are driven by gearing chain or cable from the forward axle, and are rotated in the opposite direction to the car wheels, or as indicated by the arrows in Figs. 1 and 2.

Any further information may be had by addressing the inventor at the address given above.

No. 45 FREMONT STREET,

SAN FRANCISCO, CAL.

GENERAL VIEW OF ROPEWAY-ORE TRANSPORTATION.

The Chicago Cable Road.

The most successful of the cable roads built East of the Rocky mountains is that in Chicago. It is 10½ miles long, with a double track, 5-foot gauge, and runs on very busy streets, which are almost a dead level.

The climate of Chicago is one of extremes, the thermometer reaching 90 degrees in summer and zero-Fahrenheit in winter, and snow falls very heavily.

The tube in which the rope runs is made much deeper than in San Francisco, being over four feet in depth, and the rope is placed about 30 inches above the bottom of the tube, thus allowing for a certain accumulation of light snow which might drift in through the narrow slit in the top of the tube, but at the depth of four feet there is usually natural warmth enough to prevent any material freezing.

The foundation for the roadbed and tube was quite soft and yielding, and consequently needed a broad base of concrete to sustain the superstructure, hence the expense of construction was quite heavy.

The rope, which is four inches in circumference, is made of steel wire, and has six strands of 16 wires. All the driving and angle pulleys

not a trip has been lost from snow or ice. The following letter from the president of the Chicago City Railroad Company shows the experience there in winter:

CHICAGO, March 9, 1883.

Mr. Chas. H. Phelps, 206 Broadway, N. Y.
—DEAR SIR: Your favor of the 6th inst. at hand. You ask regarding the operation of our cable railway system during the winter, and I am pleased to assure you that we have run smoothly and without the loss of a single trip during the entire winter.

The frost has penetrated the ground, by actual measurement, five feet six inches, and we have had heavy snow and hard rains, with intense cold immediately after it, the mercury dropping to 29° below zero.

Our construction has not been affected a particle so far as we have been able to discover, and the most skeptical now confess the system a success. When our lines operated by horses were blockaded by heavy storms, our cable lines were doing full service and at full speed.

Very truly yours, C. B. HOLMES,
Pres. and Sup't Chicago City Railway Co.

In a discussion on Mr. Hanscom's paper before the Technical Society, Mr. G. W. Dickie said that the power required for moving the cable depends to a great extent on the con-

The National Cable Railway Co.

A company has been organized under the laws of the State of New York with a capital of \$2,500,000, in 50,000 shares. The National Cable Railway Company was organized for the purpose of introducing throughout the United States the system of Cable Railways, matured by Mr. A. S. Hallidie, as operated in the cities of San Francisco and Chicago, and is the exclusive owner of the following United States Letters Patent, to wit:

No. 100,140.....	Feb. 22, 1870
127,690.....	June 11, 1872
163,855.....	June 1, 1875
170,136.....	April 18, 1876
179,016.....	June 20, 1876
179,786.....	July 11, 1876
181,817.....	Sept. 5, 1876
182,663.....	Sept. 26, 1876
183,928.....	Oct. 31, 1876
183,929.....	Oct. 31, 1876
184,624.....	Nov. 21, 1876
195,372.....	Sept. 18, 1877
195,504.....	Sept. 25, 1877
195,505.....	Sept. 25, 1877
Reissue No. 7,339.....	Oct. 16, 1876
7,807.....	April 17, 1877

The foregoing include all the original patents granted to Mr. A. S. Hallidie.

These patents have been twice broadly sustained in the United States Circuit Court as

The New Road in Los Angeles.

The first city in California, outside of San Francisco, to adopt the cable system of street-car propulsion is Los Angeles, where a road is now in course of construction and will be finished in a few weeks. It is being built by the Second Street Cable R. R. Company, and is one mile and a half long.

It is peculiar in having a single track road with turnouts, and runs from the intersection of Spring and Second, over Second to Lake Shore avenue, and over Lake Shore avenue to Diamond, thence over Diamond to the junction of Texas and Diamond. The engine house is located about midway. A Corliss engine 14 by 30 is used, built by Savage, Son & Co., of San Francisco; the rest of the machinery was built by the Union Iron Works, of San Francisco. The cars and dummies were built by A. F. Knorp of San Francisco. The wire rope is what is known as three-inch flexible, crucible steel, manufactured by the California Wire Works, also of San Francisco. Work was commenced about the 15th of April and the road will be completed the 15th of August. The tube is similar to the one used on the Clay street road. The gauge is 3 feet 6 inches.

In operating this road, where turnouts are

DUMMY AND CAR ON THE CHICAGO CABLE RAILROAD.

are 12 feet in diameter. The engines at this time in use are two in number of the "Wheelock" pattern; cylinder, 24" diameter by 48" stroke. Two other engines are ready for use as other cable lines in course of construction are completed. The boilers are in 4 sets of 2 each of what are known as the Babcock & Wilcox pattern.

The town end rope is run at 8 miles per hour; the suburban end at 9 miles. At the town terminus a second rope is employed, which is driven by a 6-foot pulley, placed on the same shaft as the 12-foot terminal pulley of the main cable, and consequently travels at one-half the speed of the latter, and carries the dummy and cars around a square, making a return by way of Madison street, Wabash avenue and Lake street to State street, passing around four corners.

The increase of passenger traffic has been so great that one dummy generally hauls two cars, and frequently three, carrying as high as 250 passengers in the train, and 100,000 passengers are sometimes carried in a day. The engraving on this page shows the appearance of the cars and dummy on the Chicago road.

It has been objected to the cable system that it cannot be worked in winter on account of snow and ice. The working of the Chicago cable roads has demonstrated, however, that the cable is the only system which will clean the snow from the track where all others failed. With the cable there is no loss of power as with locomotives with their wheels slipping, or with animals sliding upon the smooth surface; all that is necessary is to keep cars moving with snow plows or sweepers. During the winter the Chicago road has been in operation

dition of the moving part on the road bed—the pulleys generally. At one time on the Sutter street road a change that was made caused a reduction of 40 horse-power as the mean of cards taken in one hour at five minute intervals. They had been using a certain quality of oil that gummed and hardened, and on one day four of the large pulleys froze. The high rate of power was chargeable to some extent to the poor lubricant. The quality of oil, the time of oiling, etc., have an effect, so much so that it is difficult to get any data which will agree one day with the other.

The power required on the Market street road is about the same as that at Chicago. It corresponds also very nearly with that on the roads in New Zealand. In Philadelphia, when they started, they had 8,000 feet of rope, and the engineer said it took 100 horse power to move the rope alone, nearly 5 times as much as is taken on the Clay street hill road in this city. They had probably the best pair of engines in the United States to run the road, too.

The length of surface of the jaws of the grip has an effect on the wear of the rope in cable roads. The shortest dies are those on the Clay street road, 3½ inches. There are some in use, however, over 8 inches. Those on the Market street are 12 inches, and the same on the Sutter street. The Chicago roads have the dies about two feet long.

A BREAKWATER is to be built off the mouth of Smith river. Subscriptions are solicited at Crescent City for the purpose.

commanding the cable system, by decisions in contested cases, on both the law and equity sides of the court, and the Company and its counsel have an undoubted confidence in their validity.

The Charter of the Company, which is organized under the laws of New York, confers all the powers and privileges of a Railroad Rolling Stock and Construction Company, by which it can cable and equip existing street railroads as well as build new lines, and the exclusive right to grant licenses under these patents.

Under these patents the following street railroads have been constructed and are now operating under licenses granted to them, viz.: Clay Street Hill Railroad Company, San Francisco; Sutter Street Railroad Company, San Francisco; California Street Railroad Company, San Francisco; Geary Street Railroad Company, San Francisco; Presidio and Ferries Railroad Company, San Francisco; Chicago City Railway Company, Chicago.

The curves on cable roads absorb a large amount of power. In a rough way each of these curves is estimated to take about 28 horse power. This is as near as we can gather; that is in comparing it with the weight of a rope on a straight road and comparing the weight of rope in motion on both roads. This is, of course, a rough way of determining the question.

The Commissioners of taxes and assessments give valuation of New York thus: Real estate, \$1,168,000,000, against \$1,120,000,000 last year; personal estate, \$371,000,000, against \$1,332,000,000 in 1884.

met the rope is dropped from the grip and the cars pass around the turnout by gravitation. There is only one slot for the grip, the two parts of the rope traveling in opposite directions, running very close to each other. The pulleys are placed in pairs 25 feet distant from each other. The pairs are not set side by side, but are a foot or two from each other lengthwise the line. There is a turn-table at each end of the road for reversing the dummy.

The power is communicated to the cable on the rope system. The rope is driven from the main shaft over a 4 foot rope sheave on to a 12-foot rope sheave on the countershaft; four ropes being employed to transmit the power. The wire rope is put in motion by use of the Hallidie patent grip pulley. The grip to be used on the dummies is similar in construction to that used by the Sutter street in this city. The cars and dummies are the same in style and finish as those used on the Clay street in this city.

The road does not run through the most populous part of the city, but through that part most desirable for residences and all along the line of the road there are many fine buildings in process of erection.

J. M. Thompson, 45 Fremont street, S. F., is the contractor of this road, and also has a franchise for building a cable road on Temple street.

THE New York Aldermen have passed, over the Mayor's veto, a resolution permitting mechanics and laborers in the city departments to quit work at 2 P. M. Saturdays during the summer months. Their action, however, will not result in giving the mechanics and laborers pay for time when they do not work.

MECHANICAL PROGRESS

An Interesting and Important Discovery.

Condensing Lead and Zinc Fumes and Dust.

Mr. Alfred O. Walker, of Chester, England, a member of the firm of lead manufacturers, Walker, Parker & Co., Bagillt, had his attention called to some experiments made by Professor Lodge, of Liverpool, who had made the curious observation on the effect of a discharge of high-tension electricity from a point, or points, into glass jars or other vessels containing dust of any kind in suspension. Thus if a bell jar be filled with a dense smoke of magnesia, by burning some magnesia wire inside it, a very long time elapses before the magnesia settles out and leaves the glass clear of smoke. But if a metallic point be introduced into the jar, connected by a wire to one of the poles of a good frictional or induction electric machine to work, it is only necessary to set the machine to work, and almost instantly an extraordinary effect is observed inside the bell jar. The magnesia smoke commences to whirl about and then forms itself into large flakes and strings, which rapidly settle on the bottom and sides, leaving the jar perfectly clear of smoke. What would have taken several hours to settle in the ordinary course is completely cleared and deposited in a few seconds. The same effect is produced if the jar is filled with any kind of smoke, that from thick paper or from a cigar being acted upon exactly in the same manner as the magnesia. Professor Lodge and his assistant had made experiments on a very much larger scale than those in the glass jars. Rooms had been filled with dense smoke and rapidly cleared in the above manner. The report of these experiments suggested to Mr. Walker the feasibility of using this method to condense the fumes in lead smelting. *Engineering* reports as follows the results of these trials: "By means of large casks a wooden flue was constructed at right angles to one of the main flues of the lead works, and with a damper on the main flue it was possible to make any required amount of the fumes from a group of furnaces pass into and through the wooden experimental flue. This latter was provided with glass windows placed opposite one another for the purpose of observation. It also had dampers by means of which it could be filled with the furnace fumes and then closed at both ends, so that it formed a chamber representing the professor's bell jars on a very large scale. The electric machine employed was on the Voss system, the glass disk being 18 inches in diameter. It was worked in a small shed erected close to the experimental flue. One pole of the machine being connected with the ground, the other was connected to an arrangement of metallic points placed inside the flue, and exactly between two of the windows above mentioned. A well-insulated copper wire led from the pole to the top of a stout brass rod, which was fixed in the top of the flue, projecting some distance above it, and reaching so far into it as was necessary to sustain the discharge points in the desired position. This brass rod was fixed inside a glass tube of considerably larger diameter, in order to insulate it where it passed through the top of the flue. During the experiments several arrangements of discharge points were used, as, for instance, a brass ball having spikes projecting from it all round, a ring with spikes fixed upon it pointing in all directions, a cross studded with spikes in a similar manner, etc.

"The first experiments tried were upon the lead fume in a state of quiet—that is, the flue was filled with fume by allowing a strong current of it to pass through from the main flue and then simultaneously closing the inlet and outer dampers. The fume thus inclosed in the chamber, when viewed through the windows, appeared as a very dense fog or mist. Left to itself it took many hours to deposit. But as soon as the electric machine was set to work the same action took place as with the magnesia in the bell jar. Through the windows could be observed the same whirling movement around the discharge points, and in a few seconds the fog was seen changing into little flakes, like soot flakes, which rapidly flew to the sides of the chamber, and were there deposited, till in an incredibly short time the 'fume' had entirely disappeared from the atmosphere of the chamber, which was as clear as before the fume was let into it. Further experiments were then tried as to the action of the electric discharge upon the fume in rapid motion, as it is in the flues of the works. The damper in the main flue being closed, the whole of the pressure of furnace gases was turned through the experimental flue and allowed to stream out into the air. Then the electric machine was worked as before. No effect could be seen through the windows, because the rapid current swept the fume onward too fast to allow of any change being observed at that point. But at the outlet into the atmosphere, a few seconds after the discharge of electricity commenced, the effect was again very striking, the issuing fume again changing from fog into flakes. A glass plate held in the current before the discharge from the machine began was only coated, after considerable time, with a thin film. A similar plate held in the current during the working of the machine was instantly coated over with flakes and large separate specks of fume. So much was the fume agglom-

erated by its passage past the discharging points that on some occasions in perfectly calm weather some of it would fall to the ground immediately on leaving the exit opening of the flue. In short, the series of experiments proved that what took place under the bell jar took place equally in the flue of a smelting works, with all the attendant circumstances of heat, moisture and acid vapors. The trials of various arrangements of discharge points seemed to show that, within certain limits prescribed by the power of the machine in use, the more points employed the better was the result, the points being spread as uniformly as possible over the cross-section of the flue through which the fumes were passing.

"On the strength of the satisfactory results above stated, Mr. Walker decided upon taking measures to apply this new process of fume condensation on a full working scale at the Bagillt Works. The necessary plant is now in course of erection and nearly completed. The electric machines used will be on the Wimshurst system, with disks of 5 feet diameter. Two such machines have been constructed specially for the purpose by Mr. F. J. Cribb, engineer, of Chester. They will be driven by a small steam engine, the whole plant being placed in a small building close to the main flue of the works, through which pass all the gases and 'fume' from 19 furnaces. Mr. Walker proposes to extend the process in England and most European countries and in the United States. It is intended to apply it to other branches of metallurgy besides lead-smelting, as, for instance, the condensation of zinc oxide in the manufacture of zinc white, and the condensation of arsenic. But its principal field for usefulness will doubtless be in lead works, where so far all the proposed systems of condensers have either failed outright or proved so costly to erect and to work that the very imperfect results obtained did not render it worth while to continue their use." In this country an interesting field in the metallurgy of iron for this process would be the condensing of the zinc fumes in the gases escaping from those spiegelisen furnaces which utilize the residues from making zinc oxide from Franklinite ores.

AN IMPROVED CONVERTER. The bottom of which is readily removed without disconnecting the blast and stopper appliances, has been patented by J. F. Wilcox, of Pittsburg, Pa. The converter is composed of an upper section having a downwardly depending shell or extension to embrace the lower section. This section is supported by a bottom plate which is bolted to the lower edge of the shell. All the appliances for conducting the blast to the tuyeres and for sustaining and operating the stoppers are attached to the shell. An air-trunk or main blast-pipe extends entirely around the converter, and is interrupted at intervals by air-chambers opposite the tuyeres. The chambers are provided with doors, and the stems of the stoppers extend through stuffing-boxes attached to the doors. To remove the lower section of the converter the doors are thrown open and the stoppers are withdrawn. Then the bottom plate is unbolted and lowered by a hydraulic jack. The lower section is then free to be taken out.

DIES FOR MAKING HATCHETS.—The Germantown Tool Company, of Philadelphia, Pa., have procured a patent for dies for making hatchets. Two sets of dies are employed. One set has its working faces so shaped as to conform to the contour of the sides of the hatchet, while the other set conforms to the top and bottom of the same. A piece of metal is primarily forged or wrought to assume the general outline of a hatchet, and is then placed successively between the two sets of dies, after which it is ground and otherwise finished. In this way time and expense in the manufacture is claimed to be saved.

A NEW NAIL which will not leave any nail holes, and is more particularly adapted for attaching moldings and other light lumber, has been patented by J. M. Overell, of Evansville, Ind. The nail is made with a point at each end and with an outwardly projecting head or shoulder midway between the points. The nail is first driven into the wood by means of a punch which straddles the protruding point and bears on the head. When a sufficient number of nails have been driven into the wood the molding is placed over them and is driven down in any suitable manner.

A LIFE BUOY SIGNAL has been invented, says the Chicago *Herald*, the purpose of which is to light up the sea in case of accident at night. It is attached to the life buoy by a cord, and upon being thrown overboard bursts immediately on striking the water. The light, which cannot be extinguished either by wind or wave, burns for over an hour, and thus enables the work of rescue to be easily carried on.

DYEING.—The new alloy called dyeiot, brought into this market by Rompel & Co., of Hamburg, has been analyzed by Von Uhlenhuth and found to consist of copper 62.30 parts; lead, 17.75; tin, 10.42; zinc, 9.20; with traces of iron. It can be prepared by melting together 62 parts of copper, 18 of lead, 10 of tin, and 10 of zinc.

STEEL is slightly increased in bulk in the process of being hardened.

SCIENTIFIC PROGRESS.

Life Everywhere.

Life everywhere! The air is crowded with birds—beautiful, tender, intelligent birds, to whom life is a song and a thrilling anxiety, the anxiety of love. The air is swarming with insects—those little animated miracles. The waters are peopled with innumerable forms—from the animalcule so small that one hundred and fifty millions of them would not weigh a grain, to the whale, so large that it seems an island as it sleeps upon the waves. The bed of the seas is alive with polypes, crabs, starfishes, and with shell animalcules. The rugged face of the rocks is scarred by the silent boring of soft creatures, and blackened with countless mussels, barnacles, and limpets.

Life everywhere! On the earth, in the earth, crawling, creeping, hurrowing, horing, leaping, running. If the sequestered coolness of the wood tempt us to saunter into its chequered shade, we are saluted by the numerous din of insects, the twitter of birds, the scrambling of squirrels, the startled rush of unseen beasts, all telling how populous is this seeming solitude. If we pause before a tree, or shrub, or plant, our cursory and half abstracted glance detects a colony of various inhabitants. We pluck a flower and in its bosom we see many a charming insect busy in its appointed labor. We pick up a fallen leaf, and if nothing is visible upon it, there is probably the trace of an insect larva hidden in its tissue, and awaiting their development. The drop of dew upon this leaf will probably contain its animals, visible under the microscope. The same microscope reveals that the blood-ain suddenly appearing on bread and awakening superstitious terrors, is nothing but a collection of minute animals (*Monas prodigiosa*); and that the vast tracts of snow which are reddened in a single night, owe their color to the marvelous rapidity in reproduction of a minute plant (*protococcus nevalis*). The very mold which covers our cheese, our bread, our jam or our ink, and disfigures our damp walls, is nothing but a collection of plants. The many-colored fire which sparkles on the surface of a summer sea at night, as the vessel plows her way, or which drips from the oars in lines of jeweled light, is produced by millions of minute animals.—*Cornhill Magazine*.

GLACIAL ACTION.—The theory of Dr. Joseph Worster, of New York, promulgated some eight or ten years since, is still gaining ground. The doctor proposed a new and very simple theory to account for the ice-fields supposed by Professor Agassiz to have covered the whole area of Brazil during the glacial period. His view is that at a very remote date the whole surface of central South America was a high table-land elevated more than 10,000 feet above the sea level. As this would be within the ascertained region of perpetual frost, such an elevated plateau receiving and condensing the evaporation of the two contiguous oceans, and converting it into ice, would, in the course of ages, become loaded to a tremendous depth. This vast deposit, by constant pressure, would finally cause a gradual sinking of the table upon which it rested, to restore the disturbed equilibrium of gravitation; and if it may be supposed that the wave of depression commenced on the east coast and terminated on the west, the Andes range would be upheaved at the final termination of the wave. This view is in harmony with the ascertained comparative recency of the Andes as a mountain range, and brings a problem that has resulted in many crude speculations—the problem of the ice period—within the scope of very simple and well-ascertained laws of meteorology. The ice traces of North America are susceptible of explanation on the same hypothesis.

THE NATURAL GAS WELLS OF NORTHWESTERN OHIO.—Writing to *Science*, Prof. Edward Orton says: The gas wells that have been drilled within the last year in Hancock and Wood counties, Ohio, have furnished some interesting, and to some degree unexpected, information as to the geological foundations of the State. They show the presence of several formations that nowhere else appear in outcrop within the limits of Ohio. The section furnished by them agrees quite closely, as to its elements and its general lithology, with the New York oil region. I have lately examined the carefully kept records and drillings of six of these wells. They agree entirely in their main features. All begin in upper Silurian limestone, and all find their main supply of gas in the Trenton limestone. The Trenton limestone is crystalline and hard, but it shows the presence of fossils in abundance. The gas obtained from the wells is delivered with moderate pressure. It contains a notable quantity of sulphureted hydrogen. It is used so far mainly for heating and for steam production. Judicious estimates put the amount yielded each day by three wells in Findley, the county seat of Hancock county, at 500,000 feet.

THE SUN AND MOON.—How much brighter is sun than moon? Can anybody tell? Has anybody tried to tell? What shall be the standard of measurement? Sir William Thomson has lately printed a note which conveys some curious data bearing on these questions.

During the meeting of the British Association at York in 1881, he observed the moon when it was nearly full, and at about midnight. He found the light to be equal to that of a candle at a distance of two hundred and thirty centimetres. Making no account of the loss of moonlight in transmission through the earth's atmosphere, he computed that twenty-seven thousand million candles must be spread over the moon's earthward hemisphere, painted black, to send us as much light as we receive from her. Probably forty thousand million candles would be required to allow for absorption. Sir William carried his computations a little farther, and figured that, if the face of the moon which we see were painted black, and covered with candles standing packed in square order, touching one another, all burning normally, the light received at the earth would be about the same in quantity (see estimated by our eyes) as it really is.—*Science*.

TO AVOID ELECTRIC INDUCTION.—Incidental to the discussion which took place among the members of the late Electric Light Convention, was the question of induction, or the property by which one body, having electric polarity, causes or induces it in another body, without direct contact. The telephone people complain that the electric light wires seriously interfere with their lines by induction. A merchant of Glasgow, Scotland, has hit upon a very simple though somewhat costly arrangement of telephone wires by which, it is asserted, the annoyances resulting from induction are prevented. His office is connected with his house, some thirty miles distant, by a private line. To prevent disturbance from the induction of other wires, he uses a return wire, and the wires are simply arranged in a spiral or helical form as follows: Suppose each post to be provided with four insulators, arranged at the four angles of a square. The sending wire is attached to insulator 1 on the first post, 2 on the second, 3 on the third, 4 on the fourth, 1 on the fifth, and so on. The return wire is attached to the insulators at the opposite corners of the square, or what would correspond to that position, thus forming the helix. The arrangement is said to work so perfectly that the passage of telegraphic messages on neighboring wires does not produce the least disturbance.

A PHOTOGRAPH OF LIGHTNING.—Dr. Kayser recently laid before the Berlin Physical Society a photograph of lightning taken in France, and probably under the same minimal atmospheric pressure as that under which he had himself taken his recently published photograph, the lightning in France having been photographed three days earlier than that in Berlin. On the gelatinous membrane sent to Dr. Kayser there was presented very beautifully to the view the extraordinary manifold ramifications of the lightning. From the lowest part of a dark cloud a broad flash of light was seen to dart forth and throw off many fine branches, which again united multifariously, the junction at one place between one branch and another showing a broader line, while at other places the flashes appeared double.

BIRTH OF A VOLCANO.—A new volcano has been discovered in Russia. Twelve verst from the town of Ielna, in the Government of Smolensk, a hill is at present showing signs of volcanic activity. Ten years ago it was noticed that snow never rests on it, but melted away; and three years ago smoke began to issue from it, accompanied by rumblings. Lately flames have shot up and fragments of cinders and sand have been thrown up. A pole plunged in the ground was burned up in a few minutes. All around the base rich grass grows, which is eaten with relish by the cattle. Indications of volcanic energy have appeared at two other places in the neighborhood.

CURIOUS EFFECT OF ASPHALT PAVEMENTS.—It has been noticed that laborers who work barefooted upon asphalt pavements are subject to swelling of the limbs, which has been attributed to the vaporization by the heat of the feet of a small quantity of the petroleum or mineral oil which is contained in the asphalt. The nerves of the feet which govern muscular action and the contraction of the blood-vessels form an extensive and very sensitive nervous network under the arch of the foot where the skin is always thin and the nerves are consequently easily affected.—*Les Mondes*.

OBSERVATIONS OF SOLAR PROTUBERANCES.—In his report of the observations at the Royal Observatory of the Roman College during the year 1883, Tacchini gives indications of epochs of double maxima, as well as epochs of single maxima in the solar protuberances of each hemisphere, and he judges from analogy that the irregularities in the apparent contour of Venus may be due to a gaseous condition in that planet.—*Comptes Rendus*.

COCAINE AND FISH.—At a recent experiment a fish was placed in water containing one part of cocaine to the 1,000 of water; the animal floundered around for a few moments and then became as quiet as death. After two hours the fish was removed to fresh water, where he returned to activity. An examination of the oxygen in the water showed that the fish ceased to breathe during his torpid state. It is an expensive way of fishing.

HILL'S TRIUMPH ORE MILL.

Manufactured by **H. W. RICE,**
Engine, Boiler, and Plow Works,
No. 56 BLUXOME STREET, SAN FRANCISCO, CAL.

The successful working of this Mill warrants us in saying to the Mining Public that we are ready to make contracts for these Mills and to give a reasonable guarantee of their doing all we claim for them. We would respectfully refer to the letters below from Mr. B. F. Wilson, of Galena, Lander County, Nevada. Please write to Mr. F. A. Hill or myself for all and full particulars.

MR. H. W. RICE—DEAR SIR: I think it is due you that I write you some of my impressions of Hill's Triumph Ore Mill I purchased of you in March. I got it in position, and have had it running for the past two weeks. The mill is in every way more than Mr. Hill claims for it. In quantity it will do all any one wants to do. The important part to me was, will it save the gold? My mine is quartz, oxidized iron and some clay. It had been a question with me, will the gold amalgamate? The gold is very fine. The result in the working of the mill has been satisfactory. It saves a high percentage of the gold and mostly inside of the mill. Below the plates and blankets we fail to find any free gold. The wheels and channels stand well so far, and show no signs of wear. The mill appears to be serviceable and durable, and no doubt Mr. Hill has struck the correct idea in his invention, and mining men should congratulate him on inventing on ore mill to take the place of expensive stamps. I am well pleased with mine, and think there will be more wanted in this camp soon. Respectfully yours,

GALENA, NEVADA, May 8, 1885.

B. F. WILSON.

MR. H. W. RICE—DEAR SIR: Since writing the above letter I have been running the Mill up to the present time, and have worked over 500 tons of ore, and will cheerfully recommend the Mill. Respectfully yours,

GALENA, NEVADA, July 15, 1885.

B. F. WILSON.

CRYSTAL SPRINGS.

THIS DESIRABLE

Summer Resort and Sanitarium,

Situated on Howell Mountain, 2 1/2

miles N. W. of St. Helena

IS OPEN

To those seeking health, or rest and recreation. Scenery is unsurpassed. Air balmy, free from fogs and malaria. Water pure and soft, from a fine spring. Bathing facilities first-class. Good Gymnasium. Carriage and horse-back riding. An experienced physician and surgeon, with gentlemen and lady assistants, will attend all cases needing his care. Excellent facilities for treatment. Terms reasonable. Send for Circular or "Come and see."

Address RURAL HEALTH RETREAT,
St. Helena, Cal

ASSESSMENT NOTICE

Grosh Consolidated Mining Company.—
Location of principal place of business, Room 39, Merchants' Exchange, San Francisco. Location of works, Storey County, Nevada.

NOTICE is hereby given, that at a meeting of the Directors, held on the 13th day of July, 1885, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 39, Merchants' Exchange, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1885, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday the 31st day of August, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

OFFICE—Room 39, Merchants' Exchange, San Francisco, Cal.

"CLAYTON" IMPROVED

ROCK DRILLS. MINING PUMPS

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1870, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7 - No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

**PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.**

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test, which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flouted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Cal

**THE
"TRIUMPH" ORE CONCENTRATOR.**

1850. 1885.
RANKIN, BRAYTON & CO.,
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO, or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ore and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER OF INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY OF CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all the AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

A. T. DEWEY, W. B. EWER, GEO. H. STEONG) Dewey & Co.'s Scientific Press Patent Agency (ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enabled us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Manufacturer of all kinds of Chemical Stoneware - FOR - Manufacturing Chemists, Also Chemical Brick for Glover Tower.

Cable Railway Items.

CABLE railways are not only popular with the public, but pay their owners well.

VARIOUS forms of grip are used on our local roads, and several other forms have been patented which have not been put to use.

THE surface of the streets through which a cable road runs has the same appearance as in the case of a horse car line, except that between each pair of tracks is a narrow slot for the grip.

THE Market Street Cable Company are owners of some 35 patents on various things connected with the cable system, including patents of Wm. Eppelsheimer, G. T. Beauregard, Thos. H. Day, Chas. M. Cbubb, Henry Caseholt, Henry Root and Leland Stanford.

THE cable system can be applied on bridges as well as on streets. On the famous Brooklyn bridge, New York, the cars are operated by endless cables. The details of construction of the road are different from those on ordinary street roads, but the general principles are the same.

IT WAS at first thought that cable railways were only specially adapted to steep hills on

The Rural Health Retreat.

At Crystal Springs, near St. Helena, under the above title, is one of the best conducted sanitariums in the United States. Its managers are determined to make it one of the leading and most thoroughly conducted health and pleasure resorts on this coast. It is not designed as a money-making institution, but a pleasant rural home for all worthy classes who seek health, rational amusement and genuine recreation.

The aim of the institution is not simply to restore the health of its patrons, but what is often more important, to enable them to retain it and avoid illness in future.

Its situation cannot be surpassed for beautiful scenery and convenience of location from San Francisco. It is on the slope of the Howell mountain range, overlooking Napa valley, and almost overhanging as it were the eastern suburbs of St. Helena. Howell mountain has long been reputed as one of the choicest localities in the State for health-recuperating qualities, and is yearly gaining in popularity.

The pure soft water of Crystal Springs would be a great desideratum in any home. The Re-

Applications for State Lands.

The new law which will go into effect on the first of next month is as follows:

3498. All applications, under whatsoever Act, filed in the office of the Surveyor-General, must be retained ninety days before approval, and must be approved (when there is no conflict) by the Surveyor-General, at the expiration of six months, subject, however, to the provisions of Sections 3,406 and 3,407 of this code, and all unapproved applications which have been on file over six months, wherein the approval has not been demanded, and wherein the contest has not been referred to court, or a demand made for an order of reference, as provided in Section 3,414 of the Political Code, shall be null and void.

SEC. 2. This Act shall take effect on the first day of August, 1885, and the Surveyor-General shall give notice to each applicant to be affected thereby by sending to said applicant or his attorney a copy of this Act.

So far as possible, copies of said Act have been sent out from the office of the State Surveyor-General to the parties interested, but from the manner in which the records have

Mining Share Market.

There is a continued dullness in the stock market, which has grown very irksome to dealers. Nothing is expected or anticipated, particularly, in the way of a sudden change for the better in any of the mines all along the Comstock, outside of Hale and Norcross, so far as the immediate future is concerned, therefore all eyes are concentrated on that single point. If all the mines, or even neighboring mines, along the lode were pursuing deep workings, same as the Hale and Norcross, there would be competition and assistance, not only in getting the water out, but in deeper explorations. The *Enterprise* says: "Literally speaking there is nothing to sustain speculative stocks but Hale and Norcross, or to establish any special rates for the same. Were there a dozen companies thus prosecuting deep workings and practical developments, there would be competition in both mines and stocks, and prices would fluctuate accordingly, as in the glorious past; but now everybody with either mines or stocks in their speculative eyes eagerly watch Hale and Norcross, which is the single standard of value by which the

CAR AND DUMMY OF THE GEARY STREET CABLE RAILWAY.—(See page 51.)

which it was next to impossible to make use of horses, and impracticable for ordinary traffic; but experience has shown the system to be equally well adapted to level streets, and to crowded thoroughfares as well as less frequented streets.

THE CARS of the Market Street Cable Railway Company have carried as high as 57,000 passengers in one day. Under the system in vogue at the terminus, cars can be turned and dispatched in less than one minute.

THE combination cars used on the Market street road in this city, in which the car and dummy are one, has a very easy motion and great carrying capacity. It can be turned and dispatched with rapidity, and rounds sharp curves with ease, being also excellent on hilly roads, the swivel trucks being free to turn vertically and horizontally. The gripman has control of all brakes. There is little liability to accident in the use of these cars.

THE UNION IRON WORKS, the largest iron manufacturing establishment on this coast, have done a great deal of the work on the machinery of the cable railroad lines in this city. They built the engines which run the Market, Haight and McAllister street roads, and those on the Sutter and Geary street roads. They also built part of the machinery for the new Los Angeles road. The Union Works have had great experience in this line, and their machinery has always worked in a very satisfactory manner from the first start.

THE President has appointed James Kimball, of Pennsylvania, Director of the Mint, in place of H. C. Burchard,

treat is under the management of Elder J. D. Rice, who gives constant, careful and conscientious attention to his duties. He is well supported by faithful and competent assistants.

J. S. Gibbs, Medical Superintendent, is a graduate from a thorough medical and surgical course in New York city, where he afterwards had three years' practice. He was recently associated with Dr. J. H. Kellogg, Superintendent of the Medical and Surgical Sanitarium at Battle Creek, Mich., said to be the largest institution of the kind at present in the world.

We advise those wishing further information, who cannot conveniently at once visit this place, to address "Rural Health Retreat, Crystal Springs, St. Helena, Napa county, Cal."

THE FULTON IRON WORKS in this city (Hinkley, Spiers & Hayes) have done a great deal of work for the cable railways of San Francisco. In their shops were built the hoilers for the California St., the engines for the Presidio, most of the machinery for the Clay St., and the gripping machinery for the Geary St. roads. The engines on the Presidio road have shown very remarkable results in economy and efficiency.

THE TELEGRAPH HILL CABLE.—A short line of cable road is in operation in this city which carries passengers a few blocks to the summit of Telegraph Hill, and is patronized by those who go there to see the view or visit the resort on the hill. There is little peculiar in the construction of the road differing from others of the kind.

It is said Japan is assisting China in the defense of the Korean frontier against Russian,

been kept it is impossible for the Surveyor-General to know the address of a large proportion of those who have filed applications for land. For this reason Gen. Willey asks the publication of the above law for the benefit of whom it may concern. Correspondence on the subject should be addressed to H. I. Willey, Surveyor-General, Sacramento.

Satisfactory, Etc.

NOGALES, A. T., May 27, 1885.

MESSRS. DEWEY & Co., Gents:—Yours of the 18th of May enclosing notice of allowance of my application for a patent for "Process of Treatment of Nickel and Cobalt Ores," was duly received. It is extremely satisfactory, and I must say I am surprised at the rapidity with which you have accomplished a result which I expected would have taken six months or a year to reach.

Yours, very respectfully, C. H. AARON.

Gold Mines For Sale.

Two small gold mines for sale, in Kern county, California. Ore has paid by assay \$20 per ton. Worked to a depth of 60 feet. The vein is 15 inches wide. The mines are within seven miles of the Southern Pacific Railroad. The owner is not in a position to develop them without aid. The purchase price is very reasonable and there is a good opening for any one to take hold of the claims and work them. Address W. L., P. O. Box 2361, San Francisco.

OPERA GLASSES for the Panorama at Muller's Optical Depot, 135 Montgomery street, near Bush, opposite Occidental Hotel.

prices of all other mines are regulated and established.

The usual amount of development work is going ahead all along the Comstock, with no new features to mention outside of Hale and Norcross.

Bullion Shipments.

Christy, July 7, \$2,100; Hanauer, 7, \$8,200; Stomont, 7, \$5,670; Queen of the Hills, 7, \$1,200; Orland, 9, \$29,951; Kentuck, 9, \$6,000; Queen of the Hills, 9, \$1,600; Hanauer, 12, \$5,000; Crescent, 11, \$2,700; Queen of the Hills, 11, \$4,400; Drum Lummon, 10, \$25,000; Grand Prize, 12, \$15,000; Alice, 6, \$15,792; Lexington, 7, \$32,000; Allen Hays, 8, \$2,000; Alice, 10, \$3,328; Dexter, 9, \$6,400; Moulton, 6, \$14,928; Dexter, 10, \$5,840. From Nevada City, Cal., for June, \$150,000.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTLELL—California.
A. C. KNOX—Ventura and Los Angeles Co's.
G. W. INGALLS—Arizona.
E. L. RICHARDS—San Diego Co.
F. W. SMITH—El Dorado and Placer Co's.
W. B. TURNER—Oregon.
Geo. McDowell—Fresno and Tulare Co's.

THE Pinnacle mines are reported flourishing and promise a rich yield. It is expected that new developments will soon be made in that neighborhood.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONDUCTING BRAIN TO THICAMINO MACHINE.—James T. Watkins, assignor to Byron Jackson, S. F. No. 321,007. Dated June 30, 1885. The object of this invention is to feed or advance out grain from the derrick platform, upon which it is deposited by the derrick forks, to the elevator, by which it is carried to the separator or thrashing machine. It consists in a combination of devices.

SCREW FASTENING FOR BOXES OR CASES.—Eugene Ritter, Ehrenfeld, Germany. No. 321,054. Dated June 30, 1885. The invention consists of a screw which passes through the cover or part to be secured, and a cylindrical nut having internal screw threads, into which the screws fit, and external threads by which it may be screwed into the edges or body of the box, so as to form permanent sockets, into which the screws may be inserted at any time, and from which they may be removed when it is desired to remove the cover without defacing or breaking the woodwork.

ROAD LOCOMOTIVE.—Geo. G. Buckland, Tulare. No. 321,005. Dated June 30, 1885. This traction engine for ordinary roads, consists in a main frame, the forward portion of which is carried by peculiarly mounted, wide-rimmed wheels, which encircle and enclose a boiler and engine carried by the frame, and from which the front wheels are driven by suitable power-transmitting mechanism. The rear portion of the frame is carried by smaller wheels peculiarly mounted in a pivoted or swiveling truck-frame, and connected with the front wheels by power-transmitting mechanism, whereby all the wheels are drivers. It further consists in the steering-gear and in details of construction and arrangement.

BEESWAX EXTRACTOR.—Joseph D. Enas, Napa. No. 321,090. Dated June 30, 1885. This invention is in that class of wax-extractors in which a foraminous comb-basket is confined within an exterior vessel and is subjected to the action of steam. The invention consists in providing the comb basket with a top-extension projecting above and resting upon the rim of the exterior vessel and provided with handles, that portion of the basket which lies within the exterior vessel being provided with peculiarly sloping sides. It consists further in a filling-spout or lip on the exterior vessel, and a tube-connection between it and the interior water-pan, by which the latter is supplied, the said lip being so located and arranged that its top shall be a little below the level of the discharge aperture from the water-pan.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific-side of the American Continent. He writes thereof from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less concise writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Lignite; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay of Potassium Zirconate; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 196 12mo. pages, with illustrations, well bound in cloth. Price, 25¢. Postpaid, 30¢. Sold by DEWEY & CO., Publishers, No. 252 Market Street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zirconate; Electric Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores; New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 150 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F. These are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Lost Papers.

If any subscriber fails to receive this paper promptly after making due inquiries at the Postoffice, it is respectfully requested to notify this office by letter, that we may send the missing papers, and, if possible, ward against further irregularities.

A GREAT number of new houses have recently been erected in various parts of Napa valley.

COMPLIMENTARY SAMPLES OF THIS PAPER.

are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in that it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, it is the fault of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. Look carefully at the label on your paper.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

THE JENKINS STANDARD PACKING

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

Manufactured only by

JENKINS BROS., 71 John St. New York.

PAT. OCT. 25, 1881.

ALASKA MINING CO., 320 Sansome Street,
SAN FRANCISCO, CAL., July 15, 1885.

MR. A. L. FISH (Representing "The Worthington Hydraulic Works")—DEAR SIR: We started the Worthington Compound Pump on the 6th of June. It is the admired of all who see it working. We were burning 17 cords of wood per day pumping and hoisting (15 cords when pumping without hoisting) before starting the new pump, and 8 cords per day hoisting and pumping with the Worthington—showing a saving in pumping alone of 9 cords per day, at a cost of \$3.25 per cord, besides doing away with the services of two men for the 24 hours formerly required to wheel wood into the mill, effecting a net saving of \$35 per day in pumping alone. We carry steam down our shaft 500 feet. Too much credit and praise cannot be given it. We cheerfully recommend the Worthington Pump to all who require pumping machinery.

Yours truly, E. P. BATES, Superintendent and Manager.

TO WHOM IT MAY CONCERN:

We claim for the Worthington greater economy than with any other pumping engine, and give herewith a few figures for consideration. The duty trials of Worthington Direct Pumping Engines at Salem, Mass., Newark, New Jersey, and recently at Buffalo, New York, show the

consumption of coal, compared to that consumed (doing the same work) by rotative engines at Montreal, Canada, to be less than .31 per cent; Shepard engines, Buffalo, less than .42 per cent; Cornish engines, Louisville, Ky., less than .45 per cent; Cornish engines at Cleveland, Ohio, less than .55 per cent; the best Cornish engine in America, at Jersey City, N. J., less than .57 per cent; Fall River, Mass., Rotative engines, less than .33 per cent; and have all been superseded by the Worthington. The above-mentioned tests of Worthington Pumping Engines show a consumption of less than .45 per cent for the same duty that the Chicago Water Works engines show for nine years.

The Pumping Engines in use on the pipe lines of the National Transit Company are the Worthington Compound Condensing type of 500 to 800 horse power each, and are working against pressures of 1,000 to 1,500 pounds per square inch. The greatest distance between two stations is 114 miles. They are forcing oil from the oil regions of Western Pennsylvania to the cities of Buffalo, Cleveland, Pittsburgh, Baltimore, Philadelphia, Jersey City, New York City, and through the Hudson and East Rivers to Long Island City Refineries. The oil is pumped over the Alleghany Mountains, 3,000 feet high.

The Pumping Engines built for the English Government, intended for pumping water across the African desert for the British armies, are the Worthington. Every sale of the Worthington Pump is a guarantee for the purpose required.

A. L. FISH, Sales Agent, 30 and 32 First Street, SAN FRANCISCO.

The Babcock and Wilcox Boiler.

The Babcock and Wilcox boiler is a type which has been known for some time and which has gradually won its way to public favor by the results which it has accomplished. These boilers have a record for safety, durability and for economy in the use of fuel. Not long since the Fulton Iron Works, of this city, secured the agency for the manufacture and sale on the Pacific Coast, and steam users can now be supplied with this boiler, manufactured in this city as one of the local industries of California.

Mr. Chas. G. Ewing, who has represented the Babcock & Wilcox Co. on this coast for three or four years, has been engaged by the Fulton works to give personal attention to the details of this branch of the business, at 561 Howard street.

The engraving on this page shows a 125 horse-power boiler of this type. This boiler is composed of lap-welded wrought-iron tubes, placed in an inclined position and connected with each other, and with a horizontal steam and water drum, by vertical passages at each end, while a mud-drum connects the tubes at the rear and lowest point in the boiler.

The end connections are in one piece for each vertical row of tubes, and are of such form that the tubes are "staggered" (or so placed that each horizontal row comes over the space in the previous row). The holes are accurately sized, made tapering, and the tubes fixed therein by an expander. The sections thus formed are connected with the drum, and with the mud-drum also, by short tubes expanded into bored holes, doing away with all bolts and leaving a clear passage-way between the several parts. The openings for cleaning opposite the end of each tube are closed by hand-hole plates, the joints of which are made in the most thorough manner by milling the surface to accurate metallic contact, and are held in place by wrought-iron forged clamps and bolts. They are tested and made tight under a hydrostatic pressure of 300 pounds per square inch, iron to iron, and without rubbing, packing or other perishable substances.

The steam and water drums are made of flange-iron or steel of extra thickness and double riveted. They can be made for any desired working pressure, but are always tested at 150 pounds per square inch unless otherwise ordered.

The mud drums are of cast-iron, as the best material to withstand corrosion, and are provided with ample means for cleaning.

In erecting this boiler, it is suspended entirely independent of the brick-work or fire-front from wrought-iron girders resting on iron columns. This avoids any straining of the boiler from unequal expansion between it and

its enclosing walls, and permits the brick-work to be repaired or removed, if necessary, without in any way disturbing the boiler. All the fixtures, such as fronts, bearers, buckstays, gauges, valves, etc., are extra heavy and of neat design, made especially for this boiler.

The fire is made under the front and higher end of the tubes, and the products of the combustion pass up between the tubes into a combustion chamber under the steam and water drum; from hence they pass down between the tubes, then once more up through the space between the tubes, and off to the chimney.

water level; freedom of expansion; safety and durability; capacity, etc. The following are among the San Francisco and Pacific Coast users of the Babcock & Wilcox boilers: The Genesee (Flour) Mills, the Market Street Cable Railway, Visitacion Water Co. (Bay View), the Capitol Mills, Messrs. Tatum & Bowen, San Francisco; Pasadena Land and Water Co., Los Angeles; Moulton Mining Co., Butte City, Mon.; the Judson Manufacturing Co., Oakland; the California Cotton Mills Co., Oakland; the Northern Pacific R. R. Shops, Portland, Or.; the Lick Paper Mills, "Agnewe," Santa Clara

Spanish-American Trade.

English manufacturers are becoming alarmed at the inroads made upon their trade by the Americans, or Spanish-American markets. In Mexico, Central America and South America English goods have had a strong hold for a long time; but owing to dullness at home the American manufacturers have of late been reaching out for new trade, and have been getting it, too, much to the disgust of the agents of English houses. The latter are now urging their home establishments to meet the existing

competition in like manner. A correspondent of the *British Trade Journal* sums up the situation (writing from San Jose de Costa Rica) when he says: "The Americans are not content with monopolizing the hoardings and newspaper columns with advertisements, and with circulating illustrated catalogues and prospectuses; they have now begun to develop a methodical and systematic propaganda hitherto unattempted. American agents are scattered here and there to entrap the consumer, and well-paid travelers scour the country, forcing American goods on the market."

Mere grumbling, however, will not do much good to our cousins across the water. Mexico is now linked to the United States by good railroads, and this, of itself, is a fair reason why we should be favored with the preference.

With Central America, we of this coast have long had a good trade. We build vessels for their coast trade, and send them down loaded, and we take their coffee, etc., in return. With Mexico, too, our California manufacturers, especially of mining machinery, have done well. Men from this State have of late been "drumming" the Northern States of Mexico pretty thoroughly, with various classes of goods. The proportion of poor people among the population is so great, however, that only certain classes of goods will sell there. As the country becomes more settled up with Americans, our trade ought to be much greater.

This extension of trade to other countries is a good thing for this nation. The more we can make and sell abroad the better we will be off. For a hundred years we have been importing too much. Now we have so many of our resources developed that we can afford to look out of our own boundaries for customers. And we will not be likely to sit and wait for them to come, but will send and hunt them up. The American drummer with his samples will do more to change channels of trade than all the diplomats living.

TWENTY-EIGHT States in the Union have adopted laws restricting the practice of medicine to educated persons.

BOILER OF THE BABCOCK & WILCOX TYPE—125 HORSE POWER.

The water inside the tubes, as it is heated, tends to rise toward the higher end, and as it is converted into steam—the mingled column of steam and water being of less specific gravity than the solid water at the back end of the boiler—rises through the vertical passages into the drum above the tubes where the steam separates from the water and the latter flows back to the rear and down again through the tubes in a continuous circulation. As the passages are all large and free, this circulation is very rapid, sweeping away the steam as fast as formed, and supplying its place with water; absorbing the heat of the fire to the best advantage; causing a thorough commingling of the water throughout the boiler and a consequent equal temperature, and preventing, to a great degree, the formation of deposits or incrustations upon the heating surface, sweeping them away and depositing them in the mud-drum, whence they are blown out.

The steam is taken out at the top of the steam-drum near the back end of the boiler after it has thoroughly separated from the water.

Among the prominent advantages claimed for these boilers are the following: Their heating surface in furnace; joints removed from fire; large draught area; complete combustion; thorough absorption of heat; efficient circulation; quick steaming; dryness of steam; steadiness of

TAILINGS.—Superintendent W. E. Sharon, of the Yellow Jacket mine, has recently had the value of the tailings bank at the foot of Sugar Loaf mountain thoroughly tested by taking about 150 assays from different portions of the reservoir. The present shows an average value of \$5.50 per ton. These tests were made with the view of working the tailings in a large pan mill to be built on the site of the old Express mill (now partially dismantled), on the north side of the reservoir. The assays proved too low, however, to admit of profit with steam power, and the project has been abandoned for the present. If arrangements can be made for a supply of water at a rate that will give a fair margin, the mill will be built. This bank of tailings, about 600,000 tons, is the property of the Bank of California.

It is generally believed that Frank Drake's mission to London is to induce the Eberhardt Company to purchase one of the valuable mining properties in Taylor District, Nevada.

THE coinage of the various mints during the month of June was \$4,936,801, of which \$2,378,150 was in standard dollars.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Georgia Gold Mines.

EDITORS PRESS:—An old California expert, writing from Georgia, says: "Californians seem to know but little about the Georgia gold mines. It has surprised some who have visited them very much, amongst others Prof. Hanks, the California State Mineralogist, who, in his hurried trip through a portion of the gold belt expressed himself as highly pleased and surprised at the low cost of working the mines here." My own visit a short time since to the rich mines of White county would be interesting to any one from your Golden State. Most of the mines in this county are idle for want of proper capital for mills, to bring water, etc. The Forest Springs mines, said to be the best ever opened in the State, are about to be opened anew for work, having recently had their water rights confirmed in the U. S. Courts. These mines were formerly the old Sprague & Lewis and worked in a small way over fifty years ago. The quartz rock from the Sprague yielded from \$1 to \$5 per bushel, or \$20 to \$100 per ton. Rock lately crushed from this mine yielded \$18.13 per ton.

The "Lewis" is another true fissure vein and pays from \$6 to \$26 per ton, while the cost of mining and milling is less than one dollar per ton.

The famous "Loud" placer mines are drawing attention now. Seven and three-fourths pounds of gold were found in a pocket in the slate-bed rock. Another find of 17 nuggets in a pocket yielded about \$3,000. This placer mining with pay dirt from 5 to 20 feet deep pays with cradle and Tom an average of one pennyweight per day to the hand, and by hydraulic washing probably the richest results to be found on the continent.

The foreman of one of the most successful mining companies gave me the result of June's clean-up, which I think cannot be equaled anywhere for cheap mining. The 40-stamp mill crushed 3,532 tons of quartz, which yielded with coarse screens \$6,624. The sluices yielded \$1,728; total, \$8,352. This cost at the mine, hydraulic pipe, etc., \$268.42; at the mill, \$300, leaving a net profit of \$7,783.58. The decomposed schistose bed-rock at the mine is filled with seams and chutes of good quartz rock. This is piped away with a stream of water and carried through sluices to the mill, which process accounts for the low cost of working the mine. Mill machinery can be bought here at a lower price than any mining country I know of. A 40-stamp water-mill was put up in running order for \$10,550.

The Blue Ridge mountains of this State seem to be full of mineral and have been very little prospected.

When Californians get started this way with their thorough knowledge of mining the country will be surprised at the rich developments sure to be the result. X X X.

Base Ore and Concentration.

It is now a generally conceded fact that no subject connected with the reduction of ores begins to compare in importance to that of concentration. In early days mines were found to pay well, and were worked without much regard to economy or close saving; but times have changed. The richer surface deposits have been worked out, and with depth comes a base mineral carrying a large percentage of the value of the ore in such a combination that it will not amalgamate without being submitted to a subsequent process of chlorination. The treatment of this product has now become a very simple, and comparatively inexpensive matter, but the separation of the base mineral from the gangue has been one of the most difficult problems ever encountered in the process of ore reduction.

Any number of machines, it is well known, have been invented for this purpose, some of them being more or less successful, but all open to serious objection in their want of adaptation to various ores, high costs, complicated mechanism, etc. The machine that shows the greatest advance towards perfection in this direction is unquestionably the Duncan. We have heard much of its operation in various parts of the country, but until recently have had no opportunity to personally observe its workings.

Some two months ago three of them were introduced into the Utica mill, near here, taking the pulp from ten stamps, and their operation has awakened great interest among mining men in all this section of the country. So satisfactory has been their work after a thorough test, that three more have been put in to run in connection with the ten-stamp battery which has recently been added to this mill. Six of them are now running, working the product of 20 stamps, upwards of 40 tons per day, saving the sulphurets in a remarkably clean condition, and fully up to 95 per cent. No such work has ever been seen in this part of the country before. These machines are wonderfully simple, and run with little or no attention, and are said to cost less than half that of any other of like capacity. Success to the Duncan!—Mt. Echo.

The May Flower G. M. Co.

The Newest Placer County Bonanza.

The late rich strike at the May Flower mine, near Forest Hill, continues to be the absorbing topic of interest to miners and all others who are connected with mining enterprises in this county. That ninety or a hundred thousand dollars have been taken out in a little more than a month is in itself a statement of the splendid results which pluck and perseverance will some times command. In this connection, a brief synopsis of the history of the mine will be timely, and very welcome to our readers. The May Flower Gravel Mining Company was organized October 26, 1877. The mine, which was bought of W. A. Freeman, is situated in Second Brushy Canyon, a mile and a half north-east of the town of Forest Hill, and comprises a large extent of ground in May Flower Canyon, Crary Canyon, Young America Canyon and Stone Canyon. The public of Placer county well know the obstacles and discouragements that beset the company at the outset of its career. When it became necessary to give up hydraulicking, Mr. Chappellet gave his attention to the study of the best method of working the mine by means of tunnels and shafts. A shaft was sunk on the plateau in Crary Canyon, July 26, 1883, the top gravel having previously been washed off. The directors of this mine did not approve of this rash and costly experiment, as they doubtless regarded it. But Chappellet was an old Comstock miner, and they had great respect for his opinions, and they did not thwart him to any great degree.

Opening the Mine.

But there was more discontent yet when the energetic superintendent continued to sink other shafts. After many vexatious delays and difficulties of various kinds, after shafts and tunnels and winzes had been run thousands of feet into the earth, when the head men of the company had had their patience finally worn out, it was all but decided that Chappellet must go. It is said he had tendered his resignation, but, like Columbus, when his sailors were about to mutiny and turn the ship back, he wanted just one more chance. And lo! like the immortal navigator, his vision was greeted with the crowning glorious discovery, his faith was rewarded, his triumph was complete. A quarter of a million of money had been expended, and how many there were, not only among directors and capitalists, but of the outside mining world, who were sorry to think that not a dollar of it would ever come back to the pockets of the too-confiding stockholders. On the 27th of May last the pay lead was struck. It was found to be seven feet thick on the bed-rock in the river bed, by 75 feet wide. The last run of one week, prior to the writing up of these notes, produced \$32,000, equal to an average of \$92.65 per ton. The present outlook is far better than when the run above mentioned was made.

The May Flower is the first company that has ever tapped the main channel on the Forest Hill divide. No other gravel mine on that divide, or anywhere else, so far as known, has made so good a showing of gold produced in so short a time as the May Flower has done during the past six weeks. That the output of the precious metal will continue there seems no reason to doubt; the channel is large and the company's claim is extensive enough to give employment for a century.

The Works.

The company's works comprise some of the largest, most imposing and altogether best mining outfits in this State or any other State. They have fine hoisting works, with three large boilers, a 10-stamp mill, which will very soon be enlarged to 20 stamps, if, indeed, the enlargement has not already been made. The frame-work covering these works and all this machinery is the largest of any in California, and is built in a very substantial manner. The hoisting-tower is 106 feet high, this height being deemed necessary in order that the mine should have a good dump. About 65 men are employed by the company, which, we may say, *en passant*, has its own boarding-house and workmen's cottages, and will soon have its own general merchandise store, butcher shop, etc.

In fact, the mine has become in itself the nucleus of a thriving village. This brief and hasty, but, so far as it goes, accurate sketch of the mine would be lacking in one important matter of interest to the public, did we not give the names of the gentlemen who compose the Board of Directors of the company. These are: James Newlands, president; R. Martinez, vice-president; V. M. Foucault, Chas. Collischonn and J. St. Denis. Messrs. F. Chappellet and Jos. Morizio, the very efficient and able secretary of the company, are the two oldest members of the company—and who were, in fact, the originators of it—and they are, of course, as already intimated, consulted about everything, and indeed they are the arbiters of the mine's destiny, for had it not been for their intelligent management and courageous persistence, the May Flower strike would not be, as it is now, the theme of conversation on Pine street and Pauper alley, as it is in Placer county and to some extent all over the coast.—*Placer Argus*.

A PLACE known as Russel's, near Santa Cruz, has been chosen for future State militia encampments. It is said to be free from fogs, and only ten minutes' walk from the beach.

Legitimate Mining.

The days of great mining excitements and "booms" are fast becoming a thing of the past. So many have proved to be fraudulent schemes of companies of men that the public do not "bite" as readily as in the early history of mining. Something more than flaming reports, accompanied by rich assays, are necessary to attract the attention of the mining public, and to induce any great number to rush to the alleged favorable localities. The great deceptions that have been practiced in the past, and the deceptions that are now being practiced in some localities on a smaller scale, have resulted in considerable injury to legitimate mining, inasmuch that the capitalist hesitates a long time before he will venture to invest in property, no matter how promising its surface indications. "Honesty is the best policy," refers to mining as well as other industrial pursuits, and when the miner deviates from its practice he injures his prospects to the extent of his misrepresentations. It is better for a mining enterprise, as well as any other kind, to build up on its own merits, and then it will stand firm like a monument of truth and worth, to give encouragement to other enterprises, and induce capital and labor to combine in developing Nature's vast mineral resources. Mining operations in many localities are progressing successfully, though slowly and without any fuss, and when the Eastern capitalist with his idle millions sees the authentic reports of the annual yield of bullion, and his curiosity is aroused to examine carefully the source from whence it flows, he will be encouraged to invest, and if he does not fall into the clutches of mining sharks, will be instrumental in building up new and prosperous camps, and while adding to his own great wealth will give labor to thousands and increase the country's wealth. It pays to publish the truth at all times and to keep within the bounds of fair estimates. The various companies that are now operating in this desert in a quiet and business-like manner, are beginning to attract the attention of outside capitalists, so that we can reasonably expect and predict that many more similar enterprises will be established, and that the great mineral bearing desert will support thousands where it now supports hundreds of people. When the California Southern is completed and the Carson and Colorado Railroad connects with the Atlantic & Pacific, then new localities will be favored with cheap transportation, and where the prospector is now struggling to open up his prospects and vainly trying to interest the capitalist to examine and purchase the same, there will ere long be thriving camps, with improvements and developments on every hand. The improvements that have been made in these mining regions in the past three years warrant these predictions, and the best results can be accomplished by pursuing a business-like and legitimate course in all operations, and avoiding wildcat schemes as has, with a few exceptions on a small scale, been done with profitable results.—*Calico Print*.

Wood River.

The Salt Lake Tribune, in an article on Wood River, Idaho, says:

Everywhere there has been the past few months a season of quietness in business and a stringency in money matters. Wood River has felt the depression severely, but just now there are signs of the coming of better times. Like all mining districts, the rush of people here brought a large percentage of non-producers expecting to gain an easy living off the labors of the miners, and, having failed to do this, are ready to condemn the country. Then, again, with prospect and mine owners there has been a disposition to sell rather than to work their properties. A few sales at large prices put the owners of almost every prospect in the notion of making similar sales rather than working their ledges or ore deposits for what there was in them. This and the idle talk that the

Mines Did Not Go Down

Deep has seriously affected the whole Wood River country, and it is time such ideas should be abandoned, and the mines be worked for what there is in them. Then the want of ample capital has kept back much development, and scores of good properties have been permitted to remain idle.

The depression in prices of lead and silver has also had its influence and turned the attention of mining men towards gold, which just now is the desideratum with many. About one year ago trouble began over miners' wages, culminating in a reduction, the shutting down of some of the best mines, the final disbandment of the Miners' Union, and a general depression in business of all kinds. These disturbances kept away outside capital, and no one can compute the loss to the district from these causes.

But Wood River is a good country. It has the prettiest hills and valleys, is the best timbered, best watered, has a good climate and in many respects is the best mining country in the West. Business has begun to revive and we confidently look forward to better times. Just now

The Gold Belt

Is exciting attention. Beginning a few miles southwest of Bellevue, a good ledge has been located for miles northward, and on the Camas No. 2 a 10-stamp mill is pounding out gold.

This mill was first thought of about three months ago, and for two or three weeks has been producing gold at the rate of nearly \$150 per day. This is from surface rock, where the immense ledge lies exposed, and is easily taken out with pick and shovel. A few weeks will determine the question of enlarging the mill and of erecting other mills on the ledge, which is extensive enough to keep hundreds of stamps employed for many years to come.

Hydraulicking in Trinity County.

A correspondent of the *Report*, writing from Trinity county, says:

Modern improvements in mining are doing much to develop the mines of this county. I was asked by my friend Henry Martin if I would like to see a finely equipped hydraulic mine. Of course I did. So early this morning with a fine span of horses attached to his buggy we drove to Junction City, nine miles below Weaverville, where we visited the Hayes Rad Hill mine, owned by Dr. Albert H. Hayes, of Boston, who purchased the McKenna and Keno mines about five years ago. These mines lie on the south side of Trinity river, extending about two miles, and contain about 500 acres of mining ground, not over ten acres of which have yet been mined. Five acres of the McKenna mine yielded \$200,000 before the sale to Dr. Hayes. Already about \$100,000 has been expended in making this what they call "a finely equipped mine." A ditch ten miles long, of nearly \$3,000 inches capacity, takes the water out of Canyon creek and conveys the same to the high bluff bank of the Trinity river, where it is stored in a large reservoir which is reached by a stairway of 580 steps. This reservoir is 300 feet above the bed-rock and 360 feet above the river.

The water is conveyed across the Trinity river in an 18-inch pipe, resting on a suspension bridge supported by two four and one-half inch cables, 516 feet long, the span from tower to tower being 350 feet. Each cable contains 1,050 wires of Bessemer steel, and weighs over 23,000 pounds. All the pipe used for mining purposes is manufactured on the grounds—the iron being shipped in sheets direct from Philadelphia—one shipment alone containing nine carloads. The mine is worked by three hydraulic giants—two number five and one number seven in size. They can throw water through 5 and 8-inch nozzles a distance of 300 feet against the gravel banks. These banks are from 20 to 140 feet high. The able and energetic superintendent of this mine, E. M. Benjamin, who for eight years was foreman of yards and docks at the Navy Yard, Mare Island, has made many improvements in working the mine, among others instead of blasting boulders and running them into the dump they are hauled away on sleds by horses. In this way they can remove 300 tons of rock per day. Thirty-two men are now employed in this mine; wages \$50 per month and board. The mining season usually extends from November to August, or a longer or shorter time, according to the supply of water. Mr. Benjamin says they have mining ground enough to last a hundred years. This does not look as if the mines of Trinity county are exhausted. Everything about this mine is in perfect and systematic order, and the enterprise of Dr. Hayes is sure to be crowned with success. The bookkeeper of the mine is Miss Ruth Benjamin, daughter of the superintendent. The books are neatly and cleanly kept, showing that she fully understands her part of the business.

NEW MINING MACHINERY.—Inventors are still diligently at work and numerous devices are constantly being brought to notice for extracting cheaply the values in the ores or for eliminating waste material and concentrating the values. Quite a number of process plants have been erected in various parts of the State the present year, notice of most of them having been given in these columns. Concentration is most desired by mine owners, who, as a rule, are well satisfied with existing prices of reduction. Denver seems to be headquarters for these experimental machines and some very good results have been secured on sample runs on ore sent for that purpose. This is encouraging, but by far the healthiest evidence of real merit in these new devices is the form by which inventors introduce their machines to the public. They do not attempt to crowd a sale through, but instead offer practical tests on any kind of ore a miner can bring, and allow him to witness their performance. Two or three machines now on exhibition in this city are winning friends daily when in operation, and it will not be surprising if a number of them are purchased by their converted admirers.

IN FAVOR OF SILVER.—Baron Rothschild, who is reputed to be one of the greatest financiers, as he is at the head of one of the greatest banking houses in the world, expresses his views on the silver question, and they are in accord with those of the friends of the double standard. He says the simultaneous employment of the two precious metals is satisfactory and gives rise to no complaint. Whether gold or silver dominates for the time being, it is always true that the two metals concur together in forming the monetary circulation of the world, and it is the general mass of the two metals combined which serves as the measure of value of things. The suppression of silver would amount to a veritable destruction of values without any compensation.

MECHANICAL PROGRESS.

The Nail Question.

Iron cut nails appear to be fast going out of date. Between the growing demand for steel cut nails and wire nails the demand for the old-fashioned iron nail is being decidedly lessened. The *Age of Steel* of St. Louis furnishes the following interesting statistics:

As very few steel nails were made in the United States prior to 1883, that year may be said to have witnessed the beginning of this innovation, which made such rapid progress in 1884 and is destined to assume large proportions during the present year. The production of steel nails in 1883 consisted of 18,224 kegs, of which 2,241 kegs were made of combined iron and steel. Their production was distributed as follows: New York, 14,768 kegs; Maine, 2,143 kegs of combined iron and steel; Illinois, 700 kegs of steel and 100 kegs of combined iron and steel; Massachusetts, 513 kegs. Of the total production of nails in the United States last year, 393,482 kegs or 5 per cent were steel nails of which 500 kegs were of combined iron and steel. Their production was distributed as follows: West Virginia, 204,336 kegs; Ohio, 130,636 kegs; Pennsylvania, 29,324 kegs, of which none were made in the eastern district; New York, 14,500 kegs; Massachusetts, 11,450 kegs; Illinois, 3,236 kegs. These figures indicate the rapid growth of an industry which had no existence three years ago.

But it is not with the statistical features of the steel nail that we have to deal at this time. It has already been shown to the satisfaction of all fair-minded men that the steel nail has many points of advantage over the iron nail. And these excellencies have been so marked and striking that many of the mills now making iron nails are preparing to enter upon the manufacture of steel nails exclusively in the near future. In addition to the mills now prepared to turn out steel nails, several are engaged in the erection of plants which will be completed within the next three months. A Bessemer plant for the manufacture of nails is being erected at Mingo Junction, O. The equipment will embrace two 5-ton converters. The two companies, whose offices are at Wheeling, with works in Ohio, are extensive manufacturers of nails, and expect their joint product of steel nails to be 2,500 kegs daily when their arrangements are completed. The Western Nail Company are pushing the erection of a Clapp-Trilliths steel plant at Belleville, Ill. The capacity of the new steel plant will be forty tons per day greater than the present capacity of the nail works, but it is the purpose of the company to increase the nail-cutting department. This will require a total of 231 nail machines—seventy-eight more than are now in operation. Other iron manufacturers at Pittsburgh, Wheeling, and points further west, are earnestly considering the advisability of adding steel plants to their iron works. In some cases the only matter to be settled is the process to be adopted. In the East several parties are making inquiries concerning the cost of building steel works, but have not yet decided to enter upon the work of erection. We think it safe to say, however, that within the next year at least fifteen or twenty mills in this country will be turning out steel nails.

Wire Nails.

We may add in this connection that wire nails are also rapidly gaining ground, and the designing of machinery for making them is taxing the inventive ability of many good mechanics. It is the opinion of some who have carefully studied the mechanical and metallurgical progress that steel-wire nails are destined to come into common use in the near future. Old Bessemer rails will come upon the market in large quantities before many months have passed, because they are wearing out faster than was thought possible in the earlier days of steel tracks. Mr. Masters has shown that they can be melted in an ordinary cupola and molded into good castings, but it is believed that they can be utilized with more profit by drawing them into wire. Old steel rails can be readily worked into wire of good quality suitable for nails. A mill has been erected in Syracuse for making wire from old rails, but it has not gone into operation. How fast steel-wire nails will come into use depends largely upon how fast old steel rails are thrown upon the market.

Self-Hardening Steel.

Mr. Adam Tindel, of the Frankford Steel Works, Philadelphia, is producing a tool steel which possesses remarkable qualities. Its chief peculiarity consists in its being self-hardening. No process of hardening in water or other liquids nor of subsequent tempering is necessary in its use. In this respect it resembles Mushet's steel. In making a tool from Mr. Tindel's steel it is shaped over the anvil, as with ordinary tool steel. When the tool is forged it is laid aside to cool in the air. When quite cold it is found to have taken a hardness exceeding that of any steel hardened by the usual process of immersion in water or brine. So hard is it that the teeth of a Stubbs' file will be turned by a single stroke across it, and the edge of a finely-tempered cold-chisel completely destroyed in an attempt to cut it, not the slightest impression being left on the Tindel steel. Another peculiarity of the metal is its ductility in forging. It forges and welds to

iron quite as readily as tool steel. At the usual heat no difference can be perceived in its capacity for being drawn, bent or tortured from any good quality of cast steel. We have been shown samples of this material, and the file and chisel tests certainly show a superiority in hardness above that of tempered steel. Mr. Tindel has a number of reports from prominent manufacturing firms and railroads who have been using his steel for nail cutters, dies and lathe and planer tools, working on tires and hard castings, which go to show that the steel, which he has named *Acier Imperiale*, will occupy a prominent place in the line of tool steels for the special uses for which such a grade of metal is adapted.

DEADENING THE SOUND OF CIRCULAR SAWS.

—The circular saw frame should be fixed on a brick or stone bed, and the shaft or bearings kept clear of the wall, so that the sound is not carried by contact into the wall. If the wall is not built, we recommend a hollow wall with iron ties, and the space filled in with sawdust, no opening of any kind being made. If the wall is built, and of single brick, line it with another single brick wall, inserting sawdust between, or a layer of hair felt. If the wall is of wood quartering, lath and plaster it on both sides, and fill in between with sawdust, or coat over the studding with hair felt, and lath and plaster over the face of it. In fixing the quartering, if attached to wood at the top or bottom, bed the attaching points, or parts, in hair felt. Sound will travel with air; therefore exclude all connection of air. Sound will travel through glass, wood, or stone, except it be of great thickness; therefore intercept it by sawdust or hair felt, which are non-conductors. If you have a circular saw on one side of a wall, and you want a point of silence on the other, you must stop all direct communication, and can the sound-laden air to travel in long and circuitous routes; and give out its vibrations before it reaches that point.

DECOMPOSITION OF CAST IRON BY HEAT.

From some experiments which M. L. Forquignon made upon malleable iron, he was led to suppose that cast iron, at a temperature somewhat inferior to its melting point, is decomposed into free graphite and a purer carburet of iron. He accordingly heated cast iron in a vacuum, to a temperature of from 900 degrees to 1,000 degrees C., for several days, without melting or softening. The metal became malleable, and its surface was covered with a dull greyish efflorescence, which produced a mark upon paper or on rough porcelain. The fracture was sometimes of a uniform black, like that of a lead pencil, and sometimes it was dotted with black grains of amorphous graphite, regularly disseminated throughout the mass. It seems probable, according to the *Comptes Rendus*, that this partial decomposition depends upon a tendency to equilibrium between the carbon, the iron, and the carburet of iron, the relative proportion of each of these bodies being a function of the temperature. The decomposition of a homogeneous solid into two other solid bodies is a very rare, if not unique phenomenon.

A NEW PROCESS OF HARDENING STEEL TO BE used for tools, dies and similar purposes has been patented by N. C. Hubbell, of Hartford, Conn. The inventor uses the substance known as snell-marl, as it comes from the bed. This substance is powdered and mixed with water, the proportions being 3½ pounds of powder to 10 gallons of water. The steel is heated in the usual manner, but to a much lower degree than in cold water. It is then plunged into the bath and remains in the same until cool. This bath is said to produce the same degree of hardness with a much lower degree of heat, and thus any cracking is claimed to be avoided. It is also said that the lower grades of steel may be hardened by this process and employed with the same success as the finer grades.

A NON-EXPLOSIVE (?) BOILER!—A correspondent of the *English Mechanic*, writing from Morchain, Somme, France, says: "A boiler of a new system, which receives the name of *generateur triyrique inextinguible*, has been invented, which differs from all those hitherto produced. The metallic surface submitted to the action of the fire does not touch the water; in no condition can the boiler get red hot; it is enveloped all over by the same temperature; hence an immense vaporization; and steam can be produced to the very last drop of water without the least danger."

TOOLS FROM OLD STEEL RAILS.—A foundryman at Youngstown, O., after experimenting for three years, has secured a process by which with one heating old steel rails can be transformed into steel tools and steel castings of every description ready for use. A company is being organized to utilize the process.

THE DAVY PROCESS.—A syndicate of Mercer Co. (Pa.) capitalists has sent a commission to England to confer with Alfred Davy, the inventor and proprietor of the Davy process of steel manufacture, in regard to the feasibility of erecting a large plant of steel works somewhere in that locality.

POWER IN TURNING SHAFTS.—If a four-inch and a two-inch shaft are both solid, and each make 100, or any other given number of turns in one minute or other specified time, six times as much power will be consumed in turning the larger as in turning the smaller shaft.

SCIENTIFIC PROGRESS.

Professor Tyndall on Electricity.

In an instructive lecture on "The Sources of Electricity," delivered before the British Royal Institution several months ago, Prof. Tyndall, among other things, dealt with the properties of hollow conductors, using in the first instance a silver teapot. He charged with electricity a brass ball held by a silken thread, lowered the ball into the open teapot, then showed that the teapot contained no electricity inside, but plenty outside, especially at the end of the spout. If a little boy, he said, could be put inside that teapot no electricity would be found there.

Faraday once made a little house of laths; it was 12 feet square and covered with tin foil. While he was inside of that house not a trace of electricity could be found there with the most delicate instruments, while the house was at the same time in communication with a most powerful battery, and giving strong sparks outside. Prof. Tyndall next spoke of the influence of points, saying that one experimenter had determined the sharpness of thorns by their action upon electricity. He electrified a great insulated paper tassel, thereby causing its long strips of paper to diverge, and the distant as well as the near approach of a needle point made the strips fall together again; this, he said, explains the principle of the lightning conductor.

The best discharge of electricity is a flame; it is more efficient than metal points. A wind flowing from electrified metal points, the air being made self-repulsive. He then put some water with the shell off in a flat glass cell and dusted a little lycopodium on the surface of the liquid; the wind from an electrified point made the particles self-repulsive, and their eddies were exhibited in magnified form upon the screen by the aid of the electric lantern. The electric mill, in which vanes are driven round by the wind from an electrified point, was next exhibited.

APPROACHING EARTHQUAKES.—The late earthquake shocks, says an English paper, which were felt over a wide area in Yorkshire, remind us that an authority on the subject of those phenomena, M. Delaunay, of Paris, is of opinion that next year will see the recurrence of upheavals of the earth's crust in an intensified form. M. Delaunay is a prophet of evil, but, unfortunately, all his prophecies have hitherto come true. His specialty is earthquakes, and he predicts them only too surely. In 1877 he announced that that year would not conclude without violent disturbances of the earth, and as a matter of fact the frightful catastrophes on the coasts of South America followed. In 1883 M. Delaunay again pointed to approaching earthquakes, and soon after the volcanic eruptions in the Indian Archipelago occurred, by which thousands of human beings lost their lives, and hundreds of square miles of terra firma were engulfed by the sea. Toward the end of last year M. Delaunay once more raised his warning voice, and the earthquakes in Spain proved how well founded were his warnings. Quite recently he has prophesied very severe volcanic disturbances for 1886. Having acquired a well-merited notoriety in foretelling earthquakes, some weight ought to be attached to M. Delaunay's utterances. He affirms that next year these natural phenomena will be of a very intense character, and that they will show themselves either when the earth is under the direct influence of a planet of the first rank, such as Jupiter, or under that of a group of asteroids, or at a time when sun and moon are nearest to our planet at the same time.

A MAGNETIC TELEPHONE.—Mr. T. H. Brown, of Fort Worth, Texas, has perfected a magnetic telephone and telegraph, which does away with batteries of any kind. It was tested over 33 miles of wire Saturday, and proved perfectly satisfactory to telegraph men present, both as a telephone and telegraph. The instrument used was composed of two ounces of wire and a half a pound of steel, and can be made for 25 cents. The transmitter is simply a horse-shoe magnet, either pole being covered with fine wire coiled carefully. The armature is a disk of steel, against which the voice is thrown, transmitted through the magnet to the wire. The receiver is similar, with smaller magnet. It is claimed by the inventor that he can transmit the voice around the world or across the Atlantic Ocean, there being no limit to distance, all that is necessary being the increase in size of the magnet. The one used to-day, weighing half a pound, was capable of transmitting the voice 75 miles. The cost of batteries is said to be \$100,000 yearly, which would be saved by this invention. In telegraphing the key attachment now in use would be applied, but very little noise would be made. The receiving operator would have a disk attached to his ear, hung by a hook in a cap, or strapped around his head. The noise now incident to telegraph offices would be done away with. No one could steal information transmitted to pool rooms, stock exchanges, etc. The telegraph would be absolutely secret. The inventor says further, that the instruments could be carried on all trains, and in case of accidents between stations, could be attached to telegraph wire, and notice given to any station just where the accident had occurred, its nature, etc., and this done in a few seconds. He also says a miner or diver could take an in-

strument attached to an insulated wire, go into a mine or water, pay out wire, and converse with a person at the other end. Messrs. Brown and Masterson go to New York this week, when Mr. Brown will make arrangements to obtain patents in France, Germany and England. These being secured, he will permit patents to issue in this country. It is possible the Western Union will buy the patent.

LATERAL MOVEMENTS OF THE EARTH'S CRUST.

—While observations are being made for the purpose of investigating "variations of latitude," it is not desirable that the United States coast and geodetic survey should make simultaneous observations with a view to discover, if possible, whether or not places along our coasts are suffering changes of latitude or longitude, or both, due to lateral movements of the earth's crust? If it is true that during geological history large lateral movements of the earth's crust have taken place, and if such changes are still going on, it would seem inevitable, that, in regions where lateral displacements are taking place, landmarks should suffer a change of latitude or longitude, or both, according to the direction of yielding to lateral pressure, and that places located upon regions suffering compression or folding should be moved, to some extent, bodily toward places in adjoining regions, toward which the movements take place, but which are not themselves undergoing displacements. Since vertical movements of the earth's crust are taking place at measurable rates, and since, in the past, lateral movements appear to have exceeded the vertical, it might be expected that lateral movements are now taking place at measurable rates. Of course, if the superficial strata are not involved in these movements, the deeper strata only yielding, surface landmarks could not reveal the movement; but in this case, and in case folds of the superficial strata along our coasts are in process of evolution, it would seem that such changes might be discovered by sinking deep vertical shafts at intervals along lines normal to the coast. These carefully surveyed at intervals during one or two centuries, it would seem, should show a measurable warping or tilting if such movements are going on. —Science.

ELECTRICITY APPLIED TO THE HANDLING OF CANNON.

—The revolution which electricity is destined to make in modern warfare, says an exchange, is only as yet in its infancy. The latest invention of Mr. Maxim is, however, an earnest of the things that yet shall be. The invention is an electrical training gear, so contrived that by the simple movement of the handle the heaviest gun may be turned by a single man, and with the greatest ease, in any direction. You pull a handle to the right, and the breech of the gun moves to the right; to the left and it moves to the left. You raise the handle and the gun is depressed at the muzzle, you depress the handle and the gun is raised. This training gear was applied to one of the 38-ton guns at Garrison Point Fort recently, and the preliminary trial showed that one man could train the gun with the greatest nicety. One may expect Providence to be very much on the side of the big guns, when a 38-ton gun can be aimed at quickly moving objects as easily as if it were a pistol or a walking-stick.

SILICEOUS BRONZE.—Copper, which is desirable on account of its great conducting power for electricity, cannot be employed on long circuits, on account of its great ductility. Henri Vivarez finds in siliceous bronze a conductivity comparable to that of copper, and a mechanical resistance greater than that of iron. The silicium may be introduced in various proportions, the mechanical resistance varying inversely as the conductivity, so that different qualities may be obtained, adapted to the different services which are required; thus in telegraphy, wires of galvanized iron which weigh 155 kilogrammes per kilometre, can be replaced by wires of siliceous bronze which weigh only 28 kilogrammes; in telephony iron wire of 25 kilogrammes can be replaced by wires of siliceous bronze which weigh only 8.45 kilogrammes. —Les Mondes.

A CURIOS BAROMETRE.—Barometric changes are determined in South Chili by the use of the east-off shell of the crab, which is said to be extremely sensitive to heat and moisture. It will remain quite white in clear, dry weather, but will indicate the approach of moist atmosphere, by the appearance of small red spots, which grow in number and size as the moisture increases; and on the appearance of rain the shell becomes entirely red, and remains so while the moisture continues.

RIBBON WIRE FOR ELECTRICAL PURPOSES.—A firm in Glasgow, Scotland, is now manufacturing ribbon wire for electric purposes. It is nearly rectangular in section, and thus can be wound into a smaller space than round wire, while its greater flexibility renders it far more easy to manipulate. It is marked with the same numbers as the corresponding sizes of round wire, and is delivered on wooden bobbins.

A BRILLIANT COMET, says Prof. Klein, the Kentucky astronomer, may be looked for to appear in the southwestern heavens in the latter part of July or first of August.

FIFTEEN hundred telephone instruments in Buffalo are supplied from electricity made by the water-power of Niagara Falls.

TABLE OF CONTENTS.

EDITORIALS.—The Babcock and Wilcox Boiler; Spanish-American Trade, 65. Passing Events; Death of General Grant; Workmen and Machinery; Liquid Fuel for Marine Boilers; Good and Bad Roasting of Copper Ore; Dredging for Gold, 68. Coal Washing Machinery; Furnace Products; The American Association, 69.

ILLUSTRATIONS.—Boiler of the Babcock and Wilcox Type—125-Horse Power, 65. Portrait of General Grant, 68. Improved Apparatus for Washing Coal, 69. Ships of the Desert at Anchor, 70.

CORRESPONDENCE.—Georgia Gold Mines, 66. MECHANICAL PROGRESS.—The Nail Question; Self-Hardening Steel; Deadening the Sound of Circular Saws; Decomposition of Cast Iron by Heat; A Non-Explosive Boiler; Tools from Old Steel Rails; The Davy Process; Power in Turning Shafts, 67.

SCIENTIFIC PROGRESS.—Professor Tyndall on Electricity; Approaching Earthquakes; A Magnetic Telephone; Lateral Movements of the Earth's Crust; Electricity Applied to the Handling of Cannon; Siliceous Bronze; A Curious Barometer; Ribbon Wire for Electrical Purposes, 69.

ENGINEERING NOTES.—New Street Car Motors; Electricity as a Railway Motor; A Steel Cartilage; A Novelty in Ship Building; Railways in India, 71.

USEFUL INFORMATION.—What is a Clearing House; Burning Sawdust; Ivy Against Brick Walls; A Substitute for Whalebone; A Valuable Paper Removing a Tall Chimney; The Erie Canal for Ships; Cayenne Pepper; Bones in the Ocean; Silver Soap, 71.

GOOD HEALTH.—The Philosophy of Vaccination; Important, if True! Put this in Your Pipe; Effect of Electricity on the Heart; The Oxygen Cure; A Cholera Preventive; Wash the Head; Trichiniasis; Bathers' Cramp; Health Studies in School; Light and Heat; Effect of Morphine on the Hair and Teeth, 71.

MISCELLANEOUS.—Base Ore and Concentration; The Mayflower (G. M. Co.); Legitimate Mining; Wood River; Hydrofracturing in Trinity County, 69. Golden Opportunity; The Desert and Its B. A. of Burden, 70. MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 72-73.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 46.

Passing Events.

The recent shipment of several bars of bullion, worth upwards of \$5,000, from the deep workings of the Hale and Norcross mine on the Comstock, is a notable one. It constituted the first bullion shipment of the noble metals from the 3,000 level of any mine in the United States or the world. The ore material for these bars came from the cutting out of the chamber on the 3,000 level, at the surface or head of this winze, and what was extracted in sinking the winze itself in the ore body.

The miners in the Cœur d'Alene region, Idaho, have held a mass meeting. It was advised by a committee that Chinese be employed to dig a bedrock flume to work Pritchard gulch, and the question of their employment was submitted to vote. The vote was 78 for Chinese and 388 against employing them.

The Union Iron Works of this city has forwarded a bid to the Secretary of the Navy to build one or more of the new cruisers here. With the bid were forwarded plans and specifications. It would be a fine thing if we could get a chance on this coast to build one of these cruisers.

There is little new to report in the mining situation aside from what is given in our usual summary.

Death of General Grant.

The flags at half-mast and the other tokens of mourning which appear, signify that the grand old hero who has been long battling with the last enemy, has found peace and rest. The telegraph announces that this morning (July 23), at 8:08 o'clock, he passed out of life peacefully and without evident pain while his bereaved family were gathered about him. Nine months have elapsed since General Grant first consulted a physician concerning the insidious foe, known as epithelioma, which finally carried him away. For at least five months the record of his contest with the disease has been daily laid before his sympathizing fellow citizens. From all parts of the country there came to his ears words of cheer and hope, words full of tender regard, affection and honor. Nor was his native country alone in the desire to bestow upon him the strength which comes from assurance of sympathy and appreciation. The whole world had learned to honor Grant; the whole world suffered with him, and the whole world now mourns his death and will cherish his memory. General Grant was undoubtedly one of the greatest men of all time, and his name will live while history endures. The record of his life is fresh in the memories of his generation and need not be recounted now. Perhaps the greatest testimony to the grandness of the man is to be found in the fact that, though he acted so prominent a part in the most excited period of our country's history, there remains for him now nothing but honor and esteem. All sectional rancor and hate has long since passed away, and there now arises before the American people a man of lofty patriotism and devotion, a soldier of unsurpassed ability and determination, a President of the purest motives and a character of acknowledged purity and nobility. Certainly posterity will possess in the life of this quiet, unassuming, resolute, devoted man an example in which truth and loftiness of character are linked with grandeur of accomplishment, such as the world finds in but few of its heroes.

Workmen and Machinery.

A rather curious strike, in this age, is that reported in an English colliery, where about a thousand men and lads have turned out, because of the introduction of a machine that they think will reduce their wages. At one time such strikes were common in most trades, but that time has pretty much passed away, the men finding that where machines caused more or better products, there were more of them employed in the end.

The men who combine against the introduction of machinery of an improved type are but imitators of a class who caused the utmost misery and destruction at one time, and their doctrines are equally mischievous and pernicious. Opposition in its worst forms assailed every invention of use that was at one time introduced. The weaver's loom, the locomotive, the steamship, the reaping machine, and a thousand other useful inventions had for a time to run the gauntlet of a severe and an adverse public opinion. Class interests, always sensitive, amalgamated themselves against the innovations, and the pressing fears that the manual labor would be reduced, that wages would fall and pauperism would increase, were advanced as the most powerful arguments that could be adduced against them. As a matter of fact none of these arguments have been justified by events. There has been scarcely any trade that has not been benefited by machinery, and though manual labor has been

eased from much of serfdom it endured, in the great majority of cases hundreds of men more have been employed in many trades than was the case before machinery was introduced. Pauperism, the growth of population considered, has not increased, and so far from wages having fallen, the working classes of this country were never better paid than they are to-day. Working men, as a rule, it is but justice to say, have recognized the value of the improvements. In the shipyards, the factories and all great works, every machine that will quicken production and lighten labor has been in recent years gladly welcomed, and strikes, owing to the introduction of such, have been literally unknown. So far, indeed, have workmen recognized the value of machinery that many artisans have produced capital inventions, and the desire to excel in this respect is on the increase. This is particularly the case in this country, where most of our improvements in machinery come from skilled mechanics themselves.

Liquid Fuel for Marine Boilers.

Some extended trials have been made in this bay of late in the use of liquid fuel instead of coal on the steamers of the Central Pacific Railroad Company. Experiments have also been made at the shops of the company at Sacramento. The most successful results have been achieved on the transfer boat, *Thoroughfare*, plying between the freight slips at the foot of Second street, in this city, and the depot in Oakland creek. Her duty is to bring the freight trains across the bay, and she makes 15 trips a day. Liquid fuel has been used on this boat for several months. The fuel costs \$1.70 per barrel, or five cents a gallon. The boat has a return flue boiler. On arriving at the slips on each side the supply of oil is shut off entirely and the jets are lighted again when she starts. Very economical results have been accomplished, the saving over the use of coal having been greater even than expected.

The freight and passenger boat, *Salamo*, plying between Port Costa and Benicia, on Carquinez straits, is also using liquid fuel. This is one of the largest steamers in the world. Her boilers are like exaggerated locomotive boilers. Ordinary tank cars come aboard on the tracks on her deck, and the oil is drawn out into large tanks alongside the boilers, from whence it can be fed to the furnaces. It is stated that the fuel does not work so well on this steamer as on the *Thoroughfare*, owing to the difference in the boilers. The Central Pacific Co. will shortly apply the system on their large stern-wheel Sacramento river steamers, *Apache* and *Modoc*. Liquid fuel is also being used on the tug-boat, *Water-Witch*, in this bay.

The fuel used by the Central Pacific Company is not mere crude petroleum. It is a residuum of petroleum after some of the lighter products have been refined out, and is about the consistency of molasses. Some of it is the product of California wells and some comes from the East.

Experiments have before been made in this city with various forms of liquid fuel for steam boilers, but for some reason they have not continued to use it. At the old Etua Iron Works various forms of burners were used with crude oils. The Sutter Street Cable Railroad Company, before they moved their engine-house, used crude petroleum under their boilers. The trouble seems to have been with the burners, which would clog. Petroleum is used on Russian steamers and also on Russian locomotives. On this coast, where coal is comparatively high in price, and where there is plenty of petroleum, the latter ought to be more utilized. The experiments being carried out by the railroad company will serve as guides for many other steam users in this locality.

The circular of J. W. Harrison speaks as follows of Australian coal. Notwithstanding the light arrivals this month from Australia, the market has been kept amply supplied by coast coals, which are arriving freely and are being offered at prices leaving slim margins to the collieries. The arrivals of Australian for the past six months are 41,000 tons in excess of the arrivals for a similar period last year, and the monthly fluctuations show the prices averaging 50 cents to 75 cents per ton less than in 1884. The present indications for future business with Australian coal are not encouraging. The quantity consumed will be diminished, and the prices obtainable will be lower. This has been brought about by a better class of coal being mined on our coast, which somewhat assimilates in character to Wallaseid, and can be put on our market at lower figures.

Good and Bad Roasting of Copper Ore.

In working that class of ore requiring roasting, the experienced metallurgist knows the immense importance of a thorough roasting of his ore as a preliminary operation, and as a key to its most successful and economical treatment during all the subsequent processes. The difficulties of smelting poorly roasted ore are innumerable. The silica of the gangue rock, not finding sufficient oxide of iron to satisfy it, forms a tough, infusible slag, while the undecomposed sulphide of iron simply melts into a matte, forming a low grade product, which requires an extension of the subsequent processes with corresponding costs. The difference in the cost of producing ingot copper from the same grade of sulphide ore, in the one case well roasted and in the other poorly roasted, may easily make the difference between profit and loss.

The following figures, taken as accurately as possible from results of work done under the superintendence of Mr. Edward D. Peters, Jr., will illustrate this point clearly. They show the cost of putting nine tons of eight per cent ore into ingot copper; in the one case the original ore being thoroughly, and in the other badly, roasted:

COMPARATIVE RESULTS IN POOR OR CARE- FULLY ROASTING.	Well roasted.	Badly roasted.
Heap roasting 9 tons ore, at 50 cents....	\$ 4 50	\$ 4 50
Smelting the same.....	22 50	31 50
Roasting 2 tons of 36 per cent matte from well-roasted ore, three roasts, at 50 cents per ton.....	3 00
Roasting 3 tons of 24 per cent matte from badly-roasted ore, five roasts, at 50 cents per ton.....	7 50
Smelting 2 tons roasted matte, at \$2.50	5 00
Smelting 3 tons roasted matte, at \$2.50	7 50
Producing ingot from last matte.....	14 00	14 00
Total.....	49 00	65 00

This shows a cost of \$5.44 per ton for the well-roasted, and of \$7.22 per ton for the badly-roasted ore; thus showing the total cost of treatment to be increased nearly one-third through carelessness in the first operation. In reality, this estimate falls far below the real cost, as Mr. Peters has not taken into consideration the serious expenses that are likely to occur from sticking-up and burning out the furnace, the formation of an increased amount of foul slag that must be resmelted, and many other annoying circumstances, all arising from the siliceous character of the slag, which, in its turn, has occurred from the imperfect roasting of the ore.

Dredging for Gold.

We notice that some people in England are getting up dredging apparatus for dredging the auriferous sands and gravel in the Ankroba river, in the Gold Coast mines, Africa. There are several companies mining there, and these machines are for them. As the projector calls it the Ball dredging apparatus, it is possible that it may be the Ball dredger that was tried in this bay for dredging mud, but which has not been in use for some years. If it did not work satisfactorily in mud it will most assuredly not in river sand.

But whatever the design of the machinery it is as well to note, for the benefit of those who have had no experience with the plan, that it does not work. We have, in California, had more experience in river mining than other people. We have tried all sorts of plans and systems in our work, and the most conspicuous failure of all has been in the trial of dredging apparatus. We have tried to obtain gold from river beds not with one kind of dredger alone, but with many kinds and systems.

Not one of them has ever been successful. Where people have tried pumps, dredgers, vacuum machines, etc., and made a failure, others have tried the same thing on some other plan, with the same result. There are many men in this State to-day who would be richer if they had profited by the experiences of others, instead of trying the system on other plans. Our river bottoms are known to be rich, but somehow, when the dirt and sand comes up the gold seems to stay down.

On most of our rivers are old wrecks of such machines, some of them very costly to their originators. It is well for our English friends, before they attempt dredging for gold in the bottom of rivers, to inquire carefully into the experience of Californians with the plan.

Coal Washing Machinery.

Coal washing machinery is among that labor-saving machinery which has been greatly perfected of late years, many improvements having been made. In the plunger machines it was found that sometimes through careless working of the machinery, without the necessary water in the box, said box was not strong enough. To prevent interruption it became necessary to devise some means for relieving the machine of the impacts of the plunger altogether. This has been accomplished by a new arrangement shown in the cut, which was described before the American Institute of Mining Engineers by S. Stutz, of Pittsburg, Pa.

The compartments *A A'* of the separator box have been set upon heavy cast-iron brackets *B*, leaving sufficient space below the bottom for the buffer *F* and sediment-valve *K*. By means of the plunger-rod *h* passing through the stuff-

machine. The operation of the present machine is the same as previously described. Fresh water is taken in through *G*, and the slack-coal, brought upon the sieve *S* by means of the chute *J*, is separated into coal and impurities, while passing from the rear to the front of the machine. The clean coal, delivered over the bridge *M* into the channel *C'*, goes to the elevator *E*, which brings it into storage-bins, while the impurities pass through the gate opening *O* into the chamber *W*, and thence through the opening *U* to the trough *T*, where they are carried away by the action of the waste water. A number of the new machines have been erected during the last two years, and give full satisfaction in every respect. They are considered the best in the market, and offer the following important advantages:

1. The use of a differential cam for the working of the plunger allows to the material, after each stroke, the necessary time to deposit

pyrites, slate, etc., falling through the meshes of the sieve, to settle. Thus the clean water is not mixed with the slimy sediments, and the latter are not forced back again into the material.

7. This machine has greater capacity per square foot of sieve-surface, with less water, than any other in use. An apparatus of, say, two sieves, 3 feet by 4 feet 9 inches, or 28½ square feet surface, can wash properly 200 to 250 tons of coal per day, of ten hours, with from 300 to 500 gallons of water per ton of coal, according to percentage of impurities, or about 7 to 9 tons per square foot of sieve-surface. The cost of washing will be from 2 to 5 cents per ton, according to locality and arrangements.

Furnace Products.

The products of lead-smelting furnaces may be, silver lead, argentiferous lead, also, and

The American Association.

The American Association for Advancement of Science will hold its meeting—the thirty-fourth—this year at Ann Arbor, Michigan, from August 26th to September 1st. A large and active local committee has been formed at Ann Arbor and has sent out a preliminary circular in which members of the association are assured there will be no lack of comfortable surroundings, and that the State University has granted the use of its buildings and grounds for the purposes of the meeting. Under the new rule, which took effect at the last meeting, members have the privilege of registering members of their families by paying the sum of three dollars for each individual to be registered. These associate members will receive badges entitling them to all the privileges extended to members generally by the local committee. The officers of several of the sections

IMPROVED APPARATUS FOR WASHING COAL.

ing-box *s* to the outside, and provided at its lower end with a shoe *a*, the impacts of the plunger are now transmitted from the buffer *F* directly to the foundation. At the same time a better guide for the plunger *P* in its up and down movement has been obtained. The plunger of the former machine had only the guide *I* and the yoke *Y*, whereas the new machine has an additional guide in the stuffing-box *s*, thus preventing wear and friction of the plunger against the lining of the box. Furthermore, the mechanism for regulating the stroke of the plunger has been simplified in dispensing with the hand-wheel. The screw-nut *e*, swivelled to the yoke *Y*, is provided with a long thread to receive the upper end of the plunger-rod *h*, and is made of steel, sufficiently strong for all purposes. It is provided with four notches *n*, into which a piece of iron can be engaged; and, by turning to the right or left, the yoke *Y* is raised or lowered, as may be required. Thus it is very easy to get the proper stroke for any kind of material, or to set the machine out of operation altogether, if necessary.

With the exception of the gate *O* for the outlet of the impurities, the other parts of the machine are left the same as before. The bottom of the plunger-box being now inclined towards the sieve chamber, less power or less weight of the plunger is required to produce the same action of the water as was obtained in the former

according to gravity. An eccentric or a crank cannot produce such a movement.

2. The use of valves between the plunger-chamber and sieve-chamber prevents the filtration and back suction of the water during the upward stroke of the plunger, and thus saves the very small coal, which otherwise will pass through the meshes of the sieve and go to waste.

3. There is a saving of motive power in the working of the washer. The body of the water in the box *A* being divided by the partition *N*, the inertia of the small part above the latter has only to be overcome.

4. The current of the water produced by the plunger *P* not only lifts up the material upon the sieve *S* to effect the separation, but also moves the separated parts, coal and impurities, towards the delivery-bridge *M* and gate *O* respectively. This is especially valuable, since the continuous and regular separation of material containing heavy impurities, such as iron pyrites, fire-clay, etc., is assured.

5. There is great economy of water. In the older machines the separated coal is floated out of the apparatus at the expense of an enormous volume of water; yet the impurities have to be removed from the sieve by the shovel, thus interrupting the working of the machine and making it intermittent and wasteful.

6. The forming of a special receptacle below the partition, *N*, allows the fine particles of

preferably called, "base bullion" in this country, in distinction from gold and silver bullion, and several other things. The base bullion is the marketable product, and is sold to the highest bidder. There are a number of refineries which make it their object to separate the silver, lead and gold, and to utilize the by-products gained in the refining process. Speiss is not utilized anywhere in the United States. Matte is either roasted and smelted again or thrown over the dump. Slag is only partially used.

Of furnace accretions there are two kinds—wall accretions and hearth incrustation or sows. The former consist of sulphide of iron in combination with sulphide of zinc and sulphide of lead, and they contain a small amount of silver. They should be roasted before resmelting; but as most smelting works have no facilities for doing this, they are usually thrown on a charge. The hearth incrustations do not contain enough silver and lead to make it worth while to have them broken up and resmelted. They are thrown over the dump.

The cleanings and furnace refuse consist of fragments of brick with metallic lead adherent; they are roughly assorted and the waste thrown away. The most important product aside from lead is the flue dust, which is generally saved and reworked, there being various methods of doing this.

are preparing special circulars relating to the Ann Arbor meeting, which can be had by addressing the respective secretaries, and special information relating to any of the sections will be furnished by their officers.

The meeting will be held to order in general session at 10 A. M. on Wednesday, August 26th, in University Hall, by the president, Professor J. P. Lesley, of Philadelphia, who will resign the chair to the president elect, Prof. H. A. Newton, of New Haven. After the adjournment of the general session, the sections will organize in their respective halls in the University buildings. After lunch the sections will meet and the vice-presidents will give their addresses. In the evening, Prof. Lesley will give his presidential address. The general sessions and meetings of the sections will be held on the following days, except Saturday and Sunday, until Tuesday night when the concluding session will take place.

The permanent secretary is F. W. Putnam, of Cambridge; general secretary, Chas. S. Minot, of Boston. The secretaries of the sections are as follows: Mathematics and astronomy—E. W. Hyde, of Cincinnati, Ohio; Physics—(Vacancy to be filled at meeting); Chemistry—F. P. Dunnington, University of Virginia, Va.; Mechanical Science—C. J. H. Woodbury, of Boston, Mass.; Geology and Geography—H. Carvill Lewis, of Philadelphia, Pa.; Biology—C. H. Fernald, of Orono, Me.; Histology and Microscopy—W. H. Walmesley, of Philadelphia, Pa.; Anthropology—Erminie A. Smith, of Jersey City, N. J.; Economic Science, and Statistics—J. W. Chickering, of Washington, D. C.

Golden Opportunity.

The continued stagnation of idle capital, says the *Shasta Democrat*, appears to indicate that there has been no marked improvement or advancement made by those controlling large sums of money. While capital has the reputation of being conservative, the history of events proves its dullness of perception, and its inability to grasp, in advance of a general movement, important points of advantage. Let the tide turn in any given direction and thousands and millions of dollars are poured thoughtlessly and recklessly and unseasonably out to secure some fancied advantage or benefit, where reason clearly indicates that there is no substantial basis of realization.

A season of general activity for a time appears to prevail, in which capital seeks the most absurd and illy-advised adventures, and is easily lured from its hiding place, even over a pathway which is marked by misfortune and disaster. On the other hand, when a reaction comes, ending in a general depression of business, the most inviting propositions, based upon the most substantial assurances of a steady and

tal turns a deaf ear and is dead and cold to every opportunity presented. In addition to this important advantage, these years of experience have furnished a class of qualified and thoroughly responsible experts, upon whose judgment millions may be safely invested. Marked improvements have been made in mining appliances. New methods of utilizing the ore product have been discovered. Marked reduction in transportation and other matters bearing upon the cost of producing have been secured, yet, notwithstanding all these permanent advantages, the plethora in capital centers still continues, and a great industry, extending over an immense portion in country, languishes in its enforced idleness.

DISPOSING OF DEBRIS.—At the Spring Valley mine, Cherokee Flat, there are two restraining dams within about six miles of the mine, which hold the heavier portion of the debris, and the latter is then carried to a canal 400 feet wide, which begins near the Oroville and Chico wagon road, and runs about 40 miles down into the tules west of the Marysville Buttes, where the company has control of 16 miles of tule land, upon which the debris is emptied, none of it going into the river. The canal crosses the railroad between Nelson and Biggs

The Desert and Its Beasts of Burden.

The conception of a desert which arises in the minds of many young and untraveled persons is often that of a sea of sand, an almost limitless area of dead-level, a waste or expanse where one sees no landmarks, as in mid-ocean he sees no land. This idea of a desert is, of course, wrong, for in fact there are hills and vales and other diversities of surface in the desert as elsewhere, and it would only require rainfall to change, in time, the marks of desolation for the beauties of the landscape such as we enjoy who live in well watered regions. The artist in the engraving gives an idea of this topography of a desert in the faint lines which appear in the background of his picture. The man is sitting on a bluff overlooking a valley, which, were there water, might be filled with growths of trees and shrubs and meadow plants and the site of many happy homes. Without water it supports no growth and is but the abode of a few hardy reptiles.

The main interest of the engraving centers in the peculiar beasts of burden which are shown and which even the children will recognize from their frequent appearance in their natural

across the desert, the former toward Berber, and the latter to the Nile near Shendi. In these marches and the subsequent retreat even the endurance of the camel has been severely tried, as it is quite a different thing to take a modern army over the Nubian or the Lihiyan desert from what it is for an Arab caravan to traverse these dreary wastes. The English soldiers have at length become familiar with the characteristics of their uncouth steeds, but it is said that the closer acquaintance has not increased their estimation of his character, and he is declared to be a sulky and troublesome beast, whose use is a most disagreeable necessity.

UNTIL firmly established upon a substantial basis, all new towns in mining camps are to a greater or less extent uncertainties. Rents and real estate assume no permanent form, but are constantly changing, and not unfrequently does property advance or depreciate 50 per cent. in 12 hours in towns of this nature, whose prosperity fluctuates with the coming in and going out of the migratory army of prospectors, etc. Everyone who is familiar with the formation of towns in the mountains knows this to be a fact.

STATE MINERALOGIST HANKS has analyzed the coal found at the Presidio and finds it to

SHIPS OF THE DESERT AT ANCHOR.—From a picture by G. RUD. HUBER.

generous return, are considered calmly and indifferently, while opportunity after opportunity, in which there is every assurance of safety and security, are passed by unimproved.

In the early history of mining enterprises, a piece of gaudily printed stock was sufficient to secure money, without investigation, examination or knowledge of the basis upon which the stock was issued. Millions of dollars have been paid for these stock certificates, in many instances representing no tangible evidence of value, present or prospective. Capitalists were eager to exchange their money for those painted bubbles, which in thousands of instances were based upon six location stakes, where there was not even a semblance of a mine within miles of the locality designated. At the present time the scene is vastly changed. Years of steady and unrelenting toil have pushed down shafts hundreds of feet throughout the mineral belt of the country, and demonstrated to a certainty the character, quality, value, cost and profit, and all the important factors entering into a demonstration of the real basis of the mining industry. In many cases the amount of ore actually in sight is greater than the amount asked for the mine. In other instances the work of development, the acquired facilities, and the demonstrated value of a property, as a producer, is equal to the amount demanded for the same. These opportunities are presented in hundreds of mining camps, from one end of our mineral-bearing territory to the other, yet capi-

stations. It has cost the company in the neighborhood of \$700,000 to provide this system and keep it in operation. Owing to the width of the canal the debris has not been carried along as rapidly as desired, and much expense has been incurred in keeping the canal from filling up. To remedy this the company has had built a dredger, and will be ready to commence operations in a day or two. It will lift the earth out of the canal and place it on the bank, thus deepening the canal and building levees at the same time. By this system it is estimated that the debris can be handled for two and a half cents per yard, whereas heretofore it has cost about 18 cents per foot.—*Nevada Transcript*.

GOLD AND SILVER IN THE ARTS.—The appropriation of gold and silver in the United States during the calendar year 1884 to industrial uses can probably be safely estimated at \$14,500,000 of gold and \$5,500,000 worth of silver, a total of \$20,000,000. All of this, however, was not withdrawn from the existing stock of bullion and coin available for monetary uses, for those reports and the statements received from the mint at Philadelphia and the assay office at New York, show the use of \$1,882,600 gold and \$414,600 silver of old jewelry, plate, etc., which, deducted from the total consumption, would leave the amount of coin and new bullion consumed in the arts and manufactures about \$12,500,000 gold and \$5,000,000 silver.

histories and books of travel. The camel, however, which has always been associated with the charming mysteries of the caravan trade of the deserts of Asia and Africa, or as the faithful friend of some nomadic sheik, has in these later days become an adjunct of modern industry. In Nevada camels were introduced some years ago to draw heavy freight wagons across the wastes of sagebrush. Afterwards we heard of them as doing some service in connection with the mining industry of Arizona. In some parts of Australia they are put to farm work. The latest application of the camel to the promotion of modern ideas is their use by the British forces operating in Africa against the Sudanese. Along the upper Nile there are stretches of desert along both banks up to the great central African plateau. Long before the first cataract is reached at Assouan, five hundred miles above Cairo, these sterile wastes approach quite up to the river banks, and all travel over them is fraught with great labor and hardship.

The difficulty of sending soldiers through such a region was the most serious matter which presented itself to the British Government in organizing its expedition for the relief of Khartoum, and the idea of utilizing the service of camels therefor, was promptly adopted by General Lord Wolseley. The equipment of this unique cavalry service, without whose aid it would hardly have been possible for the divisions of Gen. Earl and Gen. Stewart to have made their forced marches from Korti

consist of fixed carbon 47.55, volatile combustible matter 7.30, water 4.40, ash 45.15. The coal produces a fair coke. Professor Hanks will personally examine the vein, and he hopes to find parallel and valuable veins. The analysis shows the coal to differ from the ordinary lignites in the small proportion of water it contains.

A STRIKE is reported in the Granite Mountain mine, near Phillipsburg, Montana. They expended some \$50,000, and took out \$300,000 from 1,500 tons of ore. In crosscut No. 5 they found a four-foot vein, a portion of which is said to average 421 ounces of silver per ton.

THERE is a rumor to the effect that an immense ledge of high grade silver ore has been struck on the Arizona trail to Planchas de Plata. It is claimed that the vein is 30 feet wide, and that the ore will mill over a hundred dollars.

THE Downieville *Mountain Messenger* says: Mr. Jackson picked up a nugget of gold valued at \$800 the other day in his claim below Foss', at Gold Lake.

THE Prescott *Courier* says that there is scarcely a gulch in that section of Arizona out of which a miner cannot pan from 50 cents to \$5 a day in gold.

ENGINEERING NOTES.

THE Cummer Engine Co., of Cleveland, O., have recently received orders for 170, 70, 100, 130 H. P. outfits complete for the Harney Peak Mining Co., of New York, Volney Q. Irwin of Crawfordsville, Ind., Temple Pump Co., Chicago, and the Forest City Carbon Co. of Cleveland, O., respectively. In each instance the competition was very close, and the Cummer people consider the selection of their engine in these cases a very substantial indorsement of its superior merits, as about every style of automatic engine of any prominence was competing. They have also just shipped a 170 H. P. engine to the Lowell Manufacturing Co. of Lowell, Mass., and have a 105 H. P. engine about ready to ship to W. Kautsky of Indianapolis. Their sales for the Jonathan Mills Reel are still on the increase, and now run up all the way to ten per day. Their orders, we learn, are coming in from all directions and are promptly filled. They started up a number of their Ballantine Refrigerating machines this season in breweries in different sections of the country, and in every instance the machines are said to be giving the best of satisfaction.

NEW STREET CAR MOTORS. Compressed air, the cable system and electricity are having a close race just now as substitutes for horse power in propelling street cars. Traction roads in Philadelphia and electric and compressed air motors in neighboring cities are all about to be given fair trials. The traction system is already in practical use in San Francisco and Chicago, electricity is employed to some extent in Europe and one or two places in America, and compressed air motors have been commercially used in some French cities for several years. But none of these systems have been given such systematic trial as we are now promised. Each has its peculiar advantages and each has its pronounced disadvantages apart from questions of cost. Both the electric and cable roads require separate constructions for the conveyance of power along the whole route, and the compressed air motors are liable to give out before completing their journey, thus rendering them not only useless, but actual obstructions to travel. How far this can be overcome by the use of auxiliary reservoirs without increasing the cost too much, remains to be seen.

ELECTRICITY AS A RAILWAY MOTOR.—This matter is receiving more practical and thoughtful attention than most of our readers are aware. Already several experiments on a large scale are planned. Two long lines of elevated roads in New York are to be transferred into electric circuits, each car to carry its own motor, and all who ride are to be shown the working of the new system. In Philadelphia another system of supplying electricity as a motor is to be tested. The route taken by the road is to be lighted by electricity, and the cars furnished with incandescent lights supplied from the same source. In the winter it is proposed to heat the cars by application of the same current. The test will be made on street railways and ordinary railway tracks. It is not improbable, as the *Inventor* has often suggested, that in the near future passengers on our railroads and street cars may be carried more cheaply as well as more rapidly by electricity than by any power now employed.

A STEEL CANTILEVER.—Dr. Thos. Rainey, of Ravenswood, whose bill extending the charter for bridging the East river at Blackwell's Island passed the Legislature at the last session, says they propose to build a steel cantilever. The total length of ironwork will be 9,210 feet. The span from New York to Blackwell's Island is 734 feet, and the span over the east channel is 618 feet. The spans will be 150 feet above mean high tide. There will be a double railway, double carriage tracks and double promenades the entire length of the bridge. To raise the money it is intended to issue 6 per cent bonds to the amount of \$3,000,000, and stock to the same amount. It will probably cost less than \$5,000,000 to build the bridge and buy the right of way, as well as provide a depot in New York City.

A NOVELTY IN SHIP-BUILDING.—A very pretty iron steam-yacht was recently launched from Cramp's shipyard in England, which embodied some novel ideas that are interesting to builders as a new departure in steam-yacht modeling. The boat is 152 feet on the water-line, 22 feet beam and 13 feet depth. The most notable departure in her lines from the usual models of construction, is the absence of any keel from a point about 55 feet forward of the screw. This, it is asserted, will enable her to turn within her own length, and to answer her helm immediately. Another novelty is the absence of a rudder-post. She carries a balanced rudder, hung in place by hearings below the deck.

RAILWAYS IN INDIA.—The Government of British India proposes to spend \$110,000,000 on railways during the next six years, \$27,000,000 of which will be expended during 1885-86, mostly for frontier lines for military purposes. Some 3,896 miles are deemed by the Government as indispensable. The construction of 1,200 miles per year in India, says the *American Engineer*, will not appear unduly enterprising to Americans, who have seen ten times that amount completed in the United States in one season by private capital.

USEFUL INFORMATION.

What is a Clearing House?

In reply to a correspondent's inquiry as to the object and business of a clearing house, the *New York Journal of Commerce* says: "There are upwards of sixty banks in this city. Without a clearing house each of these would be obliged to make a settlement with all the rest. Suppose the A bank has checks and drafts on sixty banks, making a balance in its favor amounting in the aggregate to \$500,000, but owes the sixty-first bank the sum of \$501,000; without this general clearance it must send all over the city to collect this half million dollars, and then adding \$1,000 to it must pay its debt. But with a clearing house, all it has to do is to find out whether it is debtor or creditor on the whole, and pay that sum over. In the case above described, after the exchange had gone around the room, it would be found that the A bank had nothing to collect, and had only \$1,000 to pay. Instead of handling \$1,001,000 by receiving \$500,000 and paying out \$501,000, it handles only \$1,000. The representatives (clerks) of all the banks meet in a large room. Each has a little desk with an outside ticket hole. The managers then start on their rounds, and each exchanges slips with all the others. When through it is found who is debtor and creditor in relation to the whole body, and exactly how much. Those who are debtors then pay in what they owe, and the clearing house pays it out to the creditors, and not a cent is left on the counter. The sum of three or four millions as the resulting balance will settle daily exchanges for \$100,000,000, as only those who owe a balance on final settlement are called upon to pay anything, and only those who have a credit on final settlement will receive anything, and one must exactly balance the other."

BURNING SAWDUST.—J. N. Henning, Vandalia, Ill., tells in the *Indianapolis Wood-Worker* how he burns sawdust in his boiler furnace, as follows: "I have no trouble in burning sawdust. I have a 24 foot boiler, five flues, iron stack 25 inches in diameter, fifty feet in height. My furnace is open back of the bridge wall as low as the bottom of the ash-pit. We clean all the ashes out of the furnace, back of the bridge wall, about every two or three months. My grate-bars are four feet long; my bridge wall is about eight inches from the boiler, running from one side of the furnace to the other. Start your fires in the center with wood; use wood about once in two hours, then push the wood all to one side and fill up with sawdust. If you have any planer chips, mix some of them with the sawdust. When the wood is about burned down, and the sawdust is burning freely, move the wood to the center and fill up the side as before with sawdust. When the first side of sawdust gets burnt down clean off the grates, fill up again as before. You must work it so as to fill up one side at a time."

IVY AGAINST BRICK WALLS.—The widespread belief that ivy trained against the walls of a house is productive of general unhealthfulness, has been proved to be fallacious. The very opposite is the fact. If any one will carefully examine an ivy-clad wall after a shower, he will find it dry and dusty. It will be seen that the overlapping leaves have conducted the water from point to point until it has reached the ground, without wetting the surface of the wall. Moreover, the thirsty roots of the plant which force their way into every crevice where a firm hold can be obtained, act like suckers, and absorb all moisture within reach for their own nourishment—the ivy, in fact, acting like an overcoat, keeping the house dry, and warm as well. It also has the additional virtue of covering the ugliest structure with a mantle of beauty that is always agreeable to the eye.

An inventive Australian has devised an arrangement by which the doors of railway carriages are closed and kept closed while the train is in motion, by a lever worked by the motion of the carriage axle. When the train stops the device ceases to work and the door may be opened. It might be useful in Australia and Europe, where, except in Switzerland and some parts of Southern Germany, the doors of railway carriages are on the side, but would be of no use in this country. In England, however, there is a growing prejudice to the locking of carriage doors, and it is now done on very few, if any, of the lines.

A SUBSTITUTE FOR WHALEBONE that is claimed to be more elastic, cheaper and more durable than whalebone, is made from quills. The quills are split up into fibers, and these are twisted and bound together by a thread, so as to form a string as long as may be desired, and a sufficient number of these fastened to each other side by side make the article complete. At Three Oaks, Mich., there is at present a large factory where seventy hands are employed in manufacturing it.

A VALUABLE PAPER.—For making paper capable of resisting fire and damp, Herr W. Herre proposes to add to the pulp during the process of grinding in the rag engine solutions of certain salts, which, by mutual decomposition, form insoluble compounds. The solution with is added first contains zinc sulphate or chloride, or calcium chloride, or acetate, whereupon tallow, soap, glue and alum are added.

After having been thoroughly mixed the mass is formed into paper, which, however, before being dried, is once more passed through a bath of the same or similar composition to the solution used for mixing with the pulp in the rag engine, and ultimately impregnated with a solution of catechu.

REMOVING A TALL CHIMNEY.—Wonderful things are constantly being done in this way of moving buildings and large masses of brick and stone. We have frequently heard of tall chimneys being righted up when the ground has settled so as to give them a slightly inclined position; but the first attempt to move one of these tall, slender structures was the recent removal from its original position of a tall factory chimney in Salem, Mass. The chimney was 90 feet high and only six and a half feet square at the base. Yet by the aid of only six men and the necessary appliances this tall structure was removed to a distance of 100 feet from its original position. The dexterity and skill of the work will be more fully realized when it is stated that a sway of only about three inches would have brought the whole structure down upon the workmen. The load weighed fully 130 tons.

THE ERIE CANAL FOR SHIPS.—The New York papers are giving wide publicity to the fact that a most determined effort is to be made before the next Congress to secure money to enlarge the Erie canal to accommodate ships. They will undoubtedly pool with the Hennepin Canal people of the West, and now stand a good chance to put through both projects. Both of these schemes have in them much merit, and ought to be supported by the entire Northwest.

CAYENNE PEPPER is almost always adulterated. It is mixed with burnt rice, flour and ground mustard husks, which are generally colored red with red lead, which is very poisonous. To detect the poison of red lead, sprinkle a little on some white letter paper and draw your finger over it. If a number of small red lines appear on the paper, it may be set down that they are due to the presence of red lead.

BONES IN THE OCEAN.—The fact has been established that bones dissolve in the ocean. By dredging, it is common to bring up teeth, but rarely a bone of any kind; these dissolve if exposed to the action of the water but a little time. On the contrary, dentine, the peculiar material of which the teeth are formed, and the enamel covering them, resist the destroying action of the sea water indefinitely.

SILVER SOAP.—The following are among the many preparations used: Mix $\frac{1}{2}$ pound of jeweler's rouge with $\frac{1}{2}$ pound of prepared chalk. Or, $\frac{1}{2}$ pound levigated putty powder, $\frac{1}{2}$ pound burnt hartshorn, 1 pound prepared chalk, and 1 ounce rose pink. Or, $\frac{1}{2}$ pound fine chalk, 3 ounces pipe clay, 2 ounces white lead, $\frac{1}{2}$ ounces magnesia (carbonate), and the same quantity of jeweler's rouge.

The lance has disappeared from the list of weapons used in the Austrian army. The lancers will be converted into light cavalrymen.

GOOD HEALTH.

The Philosophy of Vaccination.

Prof. Tyndall explains the philosophy of vaccination as follows: When a tree or a bundle of wheat or barley straw is burned, a certain amount of mineral matter remains in the ashes—extremely small in comparison with the bulk of the tree or of the straw, but absolutely essential to its growth. In a soil lacking, or exhausted of, the necessary constituents, the tree cannot live, the crop cannot grow. Now, contagia are living things, which demand certain elements of life just as inexorably as trees, or wheat or barley; and it is not difficult to see that a crop of a given parasite may so far use up a constituent existing in small quantities in the body, but essential in the growth of this parasite, as to render the body unfit for the production of a second crop. The soil is exhausted, and, until the lost constituent is restored, the body is protected from any further attack from the same disorder. Such an explanation of non-recurrent diseases naturally presents itself to a thorough believer in the germ theory, and such was the solution which, in reply to a question, I ventured to offer nearly 15 years ago to an eminent physician. To exhaust a soil, however, a parasite less vigorous and destructive than the really virulent one may suffice; and, if, after having by means of a feeble organism exhausted the soil, without fatal result, the most highly virulent parasite be introduced into the system, it will prove powerless. This, in the language of the germ theory, is the whole secret of vaccination.

IMPORTANT, IF TRUE.—A correspondent of the *Stockton (California) Herald* writes as follows: I herewith append a recipe which has been used, to my knowledge, in hundreds of cases. It will prevent or cure the small-pox though the pittings are filling. When Jenner discovered a cow-pox in England, the world of science hurled an avalanche upon his head, but when the most scientific school of medicine in the world—that of Paris—published this recipe as a panacea for small-pox it passed unheeded. It is as unailing as fate, and conquers in every

instance. It is harmless when taken by a well person. It will also cure scarlet fever. Ivers is the recipe as I have used it, and cured my children of scarlet fever; here it is as I used it to cure small-pox, when learned physicians said the patient must die if cured: Sulphate of zinc, one grain; foxglove (digitalis), one grain; half a teaspoonful of water. When thoroughly mixed add four ounces of water. Take a spoonful every hour. Either disease will disappear in twelve hours. For a child, smaller doses, according to age. If countries would compel their physicians to use this, there would be no need of pest-houses. If you value advice and experience, use this for that terrible disease.

PUT THIS IN YOUR PIPE.—An English workman, just past the middle age, found that his pipe, which for many years had been a great comfort to him, was beginning to seriously affect his nerves. Before giving it up, however, he determined to find out if there was no way by which he might continue to smoke without feeling its effects to an injurious extent. He accordingly wrote to a medical journal, and was recommended to fill the bowl of the pipe one-third full of table salt, and press the tobacco hard down upon it, as in ordinary smoking. This result was very satisfactory. During the process of smoking, the salt solidifies, while remaining porous, and when the hardened lump is removed at the end of the day's smoking, it is found to have absorbed so much of the oil of tobacco as to be deeply colored. The salt should be renewed daily.

EFFECT OF ELECTRICITY ON THE HEART.—A case illustrating the power of electricity to stimulate the action of the heart occurred recently in Vermont. A three-year-old child was by mistake given a dose of morphia, and was so affected by it as to be apparently beyond help. Dr. Sherwood was called, but to all appearance the child was dead, except that there was an almost imperceptible beat of the heart. An application of electricity was made and continued four hours, at the end of which time resuscitation was complete and the child lives. During the process of restoration, if the poles of the battery were withdrawn the activity of the heart would subside, and it is very evident that but for the use of electricity death would have ensued.

THE OXYGEN CURE.—Three prominent men are stated to have lately tested the "oxygen cure." The first drew a long, deep breath from the receiver and reported that the sensation was delightful; he felt it tingle to the ends of his fingers. The second took an inspiration and became pale and agitated; he was told that the oxygen had found the weak spot in his anatomy. The third man declared he felt nothing; he could take the stuff in all day. Then it was discovered that the "Professor" had forgotten that morning to connect the tube with the oxygen reservoir. The patients had been breathing ordinary atmospheric air. The imagination has very much to do in regard to the effect of medicine on the human system.

A CHOLERA PREVENTIVE.—There is no good reason to doubt the truth of the following, which is worth bearing in mind. During the first visit of cholera at St. Petersburg, in 1832, a firm of iron founders employing 500 men, informed them that all those who would not take a teaspoonful of powdered charcoal on entering the works in the morning, must leave their employ. The consequence was that they did not lose a single man, when myriads were dying around them.

WASH THE HEAD.—A distinguished medical authority says that keeping the head clean is a great aid to health. A distinguished physician, who has spent much of his time at quarantine, said that a person whose head was thoroughly washed every day rarely ever took contagious diseases, but when the hair was allowed to become dirty and matted, it was hardly possible to escape infection. Many persons find relief for nervous headache by washing the head in weak soda water.

TRICHINIASIS.—The fact has at length been made abundantly clear that trichiniasis is contracted mainly by those who consume pork derived from the more carnivorous wild swine which abound in forests. Persons whose pork diet is derived from animals carefully fed on large dairy farms, do not suffer from the affection. —*London Medical Press.*

BATHERS' CRAMP.—The occurrence of cramp in swimmers is generally ascribed to the effects of cold—the low temperature of the water when considerably below that of the body, acting upon the great nerve centers. Although this theory may not be very satisfactory, it is the best which has yet been given.

HEALTH STUDIES IN SCHOOL.—The teachers in the Bangor public schools have during the past year been given a regular course of instruction concerning the first symptoms of contagious diseases, with a marked effect for good.

LIGHT AND HEAT.—Evidences of the sanitary value of sunlight is afforded by the recent experiments in France of Mons. E. Duclaux, who finds that the light of the sun, in its action on germs, is fifty times as destructive as its heat.

EFFECT OF MORPHINE ON THE HAIR AND TEXTURE.—It is claimed that the habitual use of morphia produces baldness and loosens the teeth.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

IMPORTANT DISCOVERY.—*Ledger*, July 19. W. B. Vandament, who has been prospecting in the vicinity of Pine Grove for the last two months, has made a discovery of considerable importance. At a point a short distance in the rear of the hotel, at the depth of 12 feet, he has uncovered a body of quartz from 40 to 50 feet wide, containing about 20 per cent of sulphurets. An assay of these sulphurets gives \$300 per ton, \$75 being in silver, the balance gold. In addition to this, the ore is said to yield about \$70 per ton in free gold.

McKINNEY.—This quartz claim, situated at Middle Bar, and owned by A. McKinney and Jos. Crannis, has suddenly loomed into prominence. It is in the midst of the group of mines where that heavy, dull, lead-colored metal is met with, carrying a large percentage of gold. The metal has been taken out in considerable quantities on both sides of the McKinney—from the Farrell claim on the south, and the Marlette, St. Julian and Mammoth mines on the north. For several months prospecting has been conducted on a small scale. A shaft was sunk to the depth of 100 feet, when a drift was run some distance, but nothing of importance was encountered. It was then decided to return to sinking. After going a few feet deeper indications of quartz began to appear, and at the depth of 107 feet a three-foot vein of splendid ore was struck, abounding with that heavy gold-bearing metal for which this camp is already so famous. Two or three boxes of the richest rock was taken to McKinney's store, the value of which is estimated at several thousands of dollars. One specimen, measuring 1x6 inches, is on exhibition at Ginochio's store, Jackson. For this piece the owners have been offered \$200, which was refused. This will give an idea of the amount of gold it contains. Assays of ore taken from different parts of the ledge, and representing a fair average of the rock, give an average of over \$200 per ton. The strike is undoubtedly the most important that has been made at Middle Bar for some time.

SOUTH SPRING HILL.—The last monthly clean-up of the ten-stamp mill yielded over \$4,000. Including sulphurets, the run is estimated at \$5,000, giving an average of \$70 per ton. At the 600-foot level the ore-body shows 20 feet wide in the stopes. The mine never appeared to better advantage than at the present time; and the prospect is regarded by good judges to be amply sufficient to justify the enlargement of the mill to 20 stamps. The contract recently let to run a drift 100 feet in length at the 700-foot level was at \$3 per foot, contractors to furnish powder, fuse, caps and candles. The size of the drift is 8 feet high, 6 feet wide at bottom and 4 feet on top; the price agreed upon is remarkably low.

SUTTER CREEK.—The Mahoney mill has been running on rock from the Washah mine, between here and Amador City. About 350 tons have been run through—fully sufficient to test the quality of the quartz. A clean up will be made this week, and all indications point to a satisfactory result.

The prospects of the Lincoln are decidedly improving. A quantity of broken quartz was discovered on the surface in working at a point about midway between the two shafts, and on the west side of the road. A crushing of the rock from this ledge, mixed with a large percentage of dirt, has been made, consisting of about 60 tons, and gave the satisfactory yield of \$5 per ton in free gold. The discovery is believed to be an entirely new ore body, as there is no knowledge of the underground workings having reached anywhere near the spot where the ledge has been exposed. There is evidently a ledge of considerable size, too. Mr. Stewart has commenced a new shaft, for the purpose of opening this ledge, and the mill will be kept running on this ore as much as possible until the ledge known to exist in the 200-foot level, and toward which operations in the south shaft are being conducted, is tapped.

There is some talk of the Mahoney being started again, under the Valentine management.

Calaveras.

WEST POINT.—*Cor. Calaveras Chronicle*, July 19: The mining boom is daily increasing here, and will soon attain proportions that will astonish the outside world, a result that has been hitherto looked for with patience. This will have the tendency to make our little town the leading mining camp of this county. The Russell Furnace has been shut down temporarily, owing to the lack of water to run the machinery. However, operations will be resumed on the different mines belonging to the same company. The latest report that is rife here at present is the bonding of the Keltz mine to Mr. Harvey, of San Francisco, for \$30,000; \$10,000 payable in ten days and the rest within sixty days. The Keltz mine outcries any previous discovery that has ever been made in the upper country. As depth is attained the body of ore increases in width, length and richness. At present it is 40 feet in length, 3 feet in width, and will average \$200 per ton, all being a glittering mass of sulphurets, galena and gold. It is the intention of the prospective purchaser to place powerful machinery on the mine and sink 1,000 feet. A quartz mill will be erected near the mine. Twenty-five tons of the ore are being crushed at Rufino's mill, which, from present indications, show that the yield will be over \$200 per ton. Work is being prosecuted in the Scorpion mine. A level is being run to connect with the south shaft for the purpose of ventilation. As soon as this is accomplished, sinking will be continued in the present working shaft, which is 120 feet in depth, till 220 feet is reached. The present hoisting engine will then be inadequate to perform the work required, consequently heavy machinery will be placed over the south shaft, which is 130 feet south of the present one. A building, 64x40 will enclose the works. The old Soap Root mine is undergoing development through the agency of Messrs. Henry & Haskins. They have extracted some valuable sulphureted ore, which lies in the ore yard, and will stand the scrutiny of the passer-by, being rich in quality. This mine is situated in close proximity to

the Scorpion. Discoveries, on a smaller scale, have been made of late by prospectors on small ledges and seams in which this country abounds. Chick & Brown are taking out ore from their mine; they have 10 tons on the dump, and will obtain as many more; ore valued at \$50 per ton. N. Markett is steadily working his little mine, and has about 8 tons on the dump that will yield \$80 per ton. Alec Fischer is continuously adding "ducats" to his coffers by perseverance and toil. He is at present extracting ore out of his mine, situated near North Fork, that will yield \$100 per ton. The recent test of the ore from the Black Mammoth, made at the Simpson Furnace, resulted favorably in the extreme. First lot worked yielded at the rate of \$40 per ton, and the next gave a result of \$78 per ton. Work on this mine will soon be commenced, and by a small expenditure of labor thousands of tons of ore, equally as good as the above mentioned, will be placed in sight.

Inyo.

THE BROCKMAN AND OTHER MINES.—*Inyo Register*, July 19: Last Saturday we paid a visit to the above named mines, located some 16 miles northerly from this place, on the western slope of the White Mountains. The C. & C. R. R. runs along in front of the series of mines, of which these are part, and from two to four miles distant. On the Brockman are two tunnels, one a short distance above the other; the lower one is in about 60 feet, the upper one about half that. The ground is blocky slate, and requires timbering. On the bottom and sides, of the lower tunnel particularly, are to be seen bodies of beautiful ore, difficult to estimate as to thickness or quantity, but certainly it can be broken out in chunks of several hundreds pounds weight. Lying on the dump are from 40 to 50 tons of ore, in quantity apparently sufficient to about half fill the entire tunnel. This ore is throughout astonishingly uniform in its make-up, so much so as to be hardly sortable at all by hand. In the main it is a bright green carbonate of copper, with whitish quartz, everywhere with spots or small chunks of so-called black metal, probably copper-silver glance. This portion is said to assay to \$300 in silver and about 40 per cent copper. The entire output looks as if it might average half as much. This tunnel was run on croppings of what was supposed to be a feeder of the main ledge cropping out about 100 feet higher up on the mountain side. On the latter, 800 feet north, an open cut has turned out about a dozen sacks of ore very similar to that already described. The character of the ledge there has not been developed, the opening being but about four feet deep. About 1,000 feet south considerable work was done years ago, and some ten tons of ore shipped to Reno, where it was worked, yielding \$200 a ton, according to report. The formation is solid slate, and the ledge, though divided into several 8 and 10-inch streaks of good looking ore, looks decidedly promising. Like the stratification of the slate, the ledge bends down the hill at the mouth of the tunnel, but at the inner end goes down vertically, so far as can be discerned by the little digging in that direction that has been done. Immense croppings, plain to view a mile distant, mark the ledge for two miles or more, all the way in slate, capped a short distance above, in a parallel line, with a mountain of metamorphic rock—a very favorable condition for rich deposits in the underlying slate. Good ore, we are assured, is found all along this ledge. In other places visited, but to which we can make no further allusion now, the ores run somewhat to black and red oxides of copper, copper pyrites, etc. These were not in the slate, however. As there is a permanent stream of the very finest mountain water just in the right place, we strongly urge any one desirous of establishing cheap concentrating works to pay that locality a visit by all means. In that view, we are positive there is enough there to justify any competent person or company in at least a thorough investigation.

Mono.

BERTON.—*Cor. Inyo Register*, July 19: At the Silver Wave good ore is being taken out.—Frank Gillespie is working the Benton mine, and has taken out several lots of good ore. This is the old claim that Lewis Lewis worked for years, clearing from \$2,000 to \$3,000 a year by his own individual labor.—Further up the grade Jim McClure has opened up a new vein this summer, running east and west, and crossing the Comanche and North Kerrick at right angles, from which he has made several shipments of rich ore. Select samples assay as high as \$3,000 to \$3,500. The average milling value is from \$400 to \$600.—North of the Elmira toward the Laura is the Deronda, owned by John Tucker, John Lynch and W. D. Mitchell. This vein has been opened by a tunnel on the ledge, now in about 200 feet, and gives promise of making a No. 1 mine. The ore consists of several grades. Lead ore running from 30 to 60 per cent in lead, and from \$200 to \$300 in silver; black ore milling \$500 per ton and iron ore milling from \$80 to \$150.—West of the Deronda is the Vedette, opened up by several tunnels, and carrying black and lead ores in their various combinations. This is owned by W. T. Redd, one of the oldest pioneers of the camp, a Mexican War veteran, etc.

MEN AND WAGES.—*Bodie Miner*, July 20: During week ending July 18th, the Standard Con. Company have employed 44 miners, 5 carmen, 2 station tenders, 1 timberman, 1 blacksmith helper, at \$4 per day; eleven laborers at \$3.50 per day; two engineers, 1 ship boss, 1 carpenter, 1 blacksmith, 1 pumpman, at \$5 per day; one foreman, at \$200 per month. These being about the rates of wages paid by the other companies in and about the town of Bodie. The Standard mine is looking well. Ore shipped to mill last week, 420 tons. The work of development is being actively pushed on the Bodie Con., employing 29 men; also, on the Mono, employing 5 miners and 1 engineer. The Con. Pacific having completed, winze station will begin sinking at once.

Nevada.

SPANISH QUARTZ CLAIM.—*Transcript*, July 18: Four months ago some Spaniards made a rich strike on the north end of the Spanish quartz claim at the head of Wood's ravine. They sunk down a few feet and got into a bunch of ore that, in two or three instances, is represented to have yielded from \$20 to \$50 to the pan. A. R. Lord & Co., owner of the claim, discovered what was going on, drove off the Spaniards and leased the claim to Baldrige, Ragan & Co., who have started in to extract 500 tons of the ore. The lessees have sunk one shaft 40

feet deep, and are now drifting into the pay chute, which is believed to extend downward in the form of a reversed letter V with the point at the surface. The drift is in nearly 20 feet. The vein is from 2½ to 3 feet thick, and good judges calculate the ore will pay from \$6 to \$8 a ton. A tunnel run into the claim by parties formerly working there gives good drainage.

Lockin & Organ are getting some excellent ore out of the Evangeline mine.

At the Double Eagle, in the same part of the district, the vein is improving with depth. The shaft is now down to water.

ROUGH AND READY.—A crusher has been put up on the Banker Hill mine, near the old town of Rough and Ready. The claim prospects well, small quantities of very rich quartz having been taken from it in times past. Several other quartz veins are being prospected, with good results, near the town.—Davy & McCormick are putting down a prospecting shaft in a ledge on Gold Flat, which, though small, has yielded some hundred-dollar ore.—Work is about to be started upon the Horse Shoe mine, to which end a large water-wheel is being put up, the wheel and pumps being obtained from the Washington mine.—Ferguson is making rapid progress in the erection of his new quartz mill, near Onega.

Sierra.

FOREST CITY.—*Sierra Tribune*, July 19: The Extension Co. have cleaned up 194 ounces, proceeds one week's work in the South Fork ground.

A 20-stamp mill is to be erected at the American Hill mine within the next 60 days.

At the Bald Mountain mine the windlass is being used again in drawing the cars up the incline. The steam and gas given off by the little engine rendered it impossible to continue its use. A handsome nugget was picked up in this mine last week.

Bald Mt. Extension Co. had a clean-up, Sunday, of 193 ounces. A quartz nugget that yielded eighteen and three-quarters ounces of gold was found at the head of the sluice. The average yield was about \$3.20 per car-load. Sixty-nine men are employed.

Dr. Sanders, of San Francisco, is up here to develop the Pilgrim Quartz mine, above Cornish Ranch, and will build a 20-stamp mill. It may be completed within 60 days.

Wm. Hanley has the contract to raise a shaft from the lower tunnel to the upper level at the Rainbow Quartz mine, at Alleghany. The chances for this company opening up another body of rich ore are now considered good.

The Young America Drift Co. will soon commence the development of their ground. A new tunnel, 30 feet lower than the old one, will be run about 1,700 feet to reach the pay lead and drain the mine. This is the old claim that paid well in early days. The front ground has been worked out. These diggings embrace a large tract of unprospected ground, extending from Oregon Creek back to the Henness Pass Road, 3,000 feet, and along the ridge for the same distance.

Sutherland & Lindley's quartz mine, at Poker, pays uniformly and well. Many other mines about the Sierra Butte are looking or paying well, the most of them being fortunate in having such experienced miners as Johns, Deidesheimer and that class of men to superintend them.

Shasta.

DEADWOOD.—*Shasta Courier*: Things are lively here, reminding one of the mining camps of Nevada in its palmiest days. Cord wood piled on every hillside, men busy as bees, digging, blasting and shoveling. With what success, the output of gold from this part of the county speaks for itself. And other industries outside of mining, such as stores, hotels, boarding-houses, etc., all of which are prospering. The McDonald mill is crushing rock from their own mine at present. Last month they crushed over 400 tons for other parties, with satisfactory results to the owners. At the Watts mine there is quite a large force of miners at work; the ore is of low grade, but the returns pay a good dividend. Other mine owners are taking out rock for grinding during the winter, as that is the only season they can get water for running their arastars.

ELSEWHERE: The Niagara Co. contemplate running a tunnel on their claim 1,000 feet in length, also to open the Summit mine in the same manner. The Highland mine, long idle, is now being worked, and shows good ore. The recent discovery of Esbey and Hill on Boswell Gulch, is looking well. They have a tunnel running along the ledge for 90 feet, and in good ore all the way. Thos. Green is opening his mine in better shape than heretofore.

REPORTED.—The discovery of rich silver ore on the Sacramento river near Portuguese Flat. A big strike of free gold on Motion creek. Reid & Co.'s quartz mill will be running in about two weeks. They have 400 tons of gold ore to start on.

SOLD.—Thos. Harrison has sold his quartz mine, owned over 20 years, to parties in Colusa county. He has worked the ore, which is highly sulphureted to some extent with an arastar, but of course, with only indifferent success, as it carries not over six or seven dollars per ton in free gold. A company put up a 10-stamp mill on the property, but not knowing how to treat the ore, it proved a failure. With the present knowledge as to working this class of ores success is now counted upon.

San Bernardino.

PROVIDENCE MINES.—*Cor. Calico Print*, July 19: Kerr & Patton's mines have been sold or bonded through a Mr. Spencer, some say to a Los Angeles company, others a syndicate of Australians, at any rate the representatives have already on the ground derricks for sinking for water to put up a mill. I understand they will put a force of men on at once and commence the better development of the mine. Kerr lately shipped some ore to Kingman going over 200 ounces.

MISCAL CAMP.—STRUCK IT RICH.—W. A. McFarlane & Sime Barrett the owners of the Cambria mine have struck it very rich. They are running the old Con. mill, of Ivanpah, on ore from that claim for the past month and four men have taken out ore enough to keep the mill pounding away every day. It is their intention to run night and day as soon as they can get in supplies. The first two bars of bullion (\$2,720) was shipped by Wells, Fargo & Co. today. More on the way and lots of it in sight. Luck be with them, they deserve it. Sime writes Cambria stock is on the market.

MOZART GROUP OF MINES.—Contracts have been let for building a road to the mines and also a main shaft. The contractors went to work today. It is said that they intend putting on more men to take out ore on this group. The Mineral Point tunnel is in ore of good quality. Belle McGillroy group continues to take out ore for shipping and milling. They have a nice pile of good ore on their dumps. Bonanza King is running through some 24 tons daily; there have already been 24 bars of bullion shipped that speaks for itself.

Tuolumne.

WORK ACTIVE AND PROSPECTS GOOD.—*Independent*, July 19: Not for many years has the mining outlook been so favorable. Prospecting is being carried on with a vigor and much success. Fifty tons of ore from Nervie's mine at Italian Bar, yielded about \$200 per ton. As the five-stamp mill is run by water, the crushing can be done cheaply. To the south, the Page mine, though not paying just now, is a good property; also, the Hart & Jacobs. Next we have the Ham & Bering mines, from which a recent crushing of 12 tons of ore with an arastar, yielded an average of nearly \$36 per ton. The Oakland mine, in the same vicinity, is a good one, as has been proven by working tests of the ore. Harkness and Garrett have been "taking it out big" during the last week—yesterday's "pan out" being \$7,800. Long & Hampton are making preparations to add forty stamps to the Willietta ten-stamp mill at Jacksonville—increasing the crushing capacity to 150 tons per twenty-four hours. As for ore there is an inexhaustible quantity in sight. They have also had the route for a water ditch surveyed and located, and will shortly set men to work to dig it. When completed the ditch will afford them a never-failing water supply. The new ditch will be 1½ miles in length, and will be fed directly from the Tuolumne river.

NEVADA.

Washoe District.

MAXIM MILL.—*Inyo Independent*, July 18: The Maxim mill is likely to pass under other management. Mr. Stansfield settled with Harris & Rhine and gave up all claims to the property, they acting as agents for parties in New York. Within the past few days Mr. John Alexander has made proposals for the use of the mill that have been accepted by Harris & Rhine, subject to the approval of the people in New York. These proposals have been forwarded, and no doubt is entertained but that they will be approved. Mr. Alexander will then at once begin work crushing and concentrating ores. All the ore that the mill and concentrators can work, can easily be supplied from Cerro Gordo, Swansea and the White Hill; Welch & Downs have already a large amount of ore in sight at the latter place suitable for concentration. The partners of Mr. Alexander in the White Hill mine are not concerned with him in the Maxim mill.

RICH STRIKE.—A rich strike is reported from Cerro Gordo. Some time since Conklin, Lasky & Moreno put a force of men to work in the Guymas mine running a tunnel. This is one of the old mines from which rich ore was taken in the flush times of Cerro Gordo. The tunnel was run toward an old shaft, which was reached at a depth of 188 feet from the surface, and struck a vein of silver ore one and a half feet wide, that gets \$700 per ton. This is the best thing yet found since work was resumed at the old camp. From the mouth of the tunnel a chute of about 200 feet in length will convey the ore to the road so that no packing will be necessary. The example set by Thomas Roland has induced others to take hold at Cerro Gordo, and now the old town begins to resume signs of returning prosperity.

HALE AND NORCROSS.—*Enterprise*, July 18: But little progress has been made in sinking the deep winze below the 3,000 level, owing to the work of placing the compressed air engine and hoisting gear in the chamber at the head of the winze. Considerable cutting out had to be done for the gallow frame, but all this preparatory work will be completed in a day or two, and sinking deeper actively resumed, following the ore vein, which was reported to hold out well in the bottom of the winze at latest accounts. The sinking of the Combination shaft deeper progresses at the rate of about two feet per day. The bottom of the shaft or sump was 60 feet below the 3,000 level, and the entire depth is now 85 feet below that level, consequently the actual additional amount sunk thus far is 25 feet.

WHITE HILL.—Assessor Irwin was up at the White Hill last Tuesday, and visited various mining claims there. In one of the claims of Welch & Downs he found an open cut in which there is a breast of ore twelve feet in depth and five feet wide. Both walls are hard and smooth and the ledge appears to go nearly straight down, the ore in the bottom of the cut being of the same character as that in the breast. On the surface Mr. Irwin says the ledge crops out over a distance of a mile and a half. Adjoining the above claim the same parties have another location, on which no great amount of work has been done, but so far as prospected it appears to have the same general character as the first mentioned.

BULLION.—The west drift on the 160 level is in about 130 feet. The water which has heretofore impeded progress somewhat has slackened off considerably, owing to the drift having passed through the heavy clay and quartz formation into more solid vein porphyry of a very favorable nature. The main ore vein is thought to be from 50 to 100 feet further west. The tributors conducting this bit of a mining operation are hard working, industrious men, worthy of liberal encouragement and of any good success they may achieve, to say nothing of the fact that a good ore development by them at this point would be of great importance to that heretofore barren section of the Comstock.

CROWN POINT.—The old bonanza stopes and workings continue to yield about 350 tons per day, and the Belcher, which is being worked through this mine, yields from 100 to 150 tons per day, all of which is reduced at mills on the Carson river. The Kentuck yields 50 or sixty tons a day, which is worked at the Rock Point mill, just below Dayton, on the Carson river. All this ore from the three mines mentioned, is of low grade, being merely the leavings or gleanings of the old high grade bonanzas which were worked out years ago.

SIERRA NEVADA.—On the 520 level the north lateral drift has been extended 75 feet during the past week, making a total length of 864 feet. This drift, running nearly in a northwest direction, partakes of the nature of a crosscut diagonally across the ore channel, and the favorable clay, quartz and vein porphyry material encountered during the last week or two indicates advancing or increasing proximity to the ore veins known to lie to the westward, and which it is proposed to crosscut more directly into in due time.

MINETTA.—This claim has already been described in the former issues of this paper. Mr. Irwin says ore can be got out anywhere along the claim. He saw one little prospect hole from which a dab of ore was taken in two days by two men, that will net forty dollars to the miners. This hole was surrounded on all sides by solid ore. Mr. Irwin thinks there is a large amount of ore at this point. Where men can start in on the surface and earn ten dollars per day, would, he thinks, be a good place to keep on trying.

JUSTICE.—The Justice Company are running a drift southwest to intercept the vein formerly known to exist in that portion of the mine, and will be in about the roth of August. It is the general opinion that they will get a large quantity of good ore in the south end of their mine. The management intend to prospect north and south after they cut the vein, and hope to work a good many miners at no distant day.

UNION CONSOLIDATED.—The main drift running north on the 500 level, hitherto known as the joint Union and Mexican drift, is now into Union ground about 90 feet, and the expense of running it will hereafter belong to the Union Consolidated alone. It is making very good progress in favorable working ground.

CON. CALIFORNIA AND VIRGINIA.—About 100 tons a day are yielded from the 1,750 level on company account, battery samples assaying \$28 per ton. The Jones lease portion of the mine, above the 1,300 level, shows a large falling off in quantity of ore extracted. Battery samples \$19 per ton.

OVERMAN.—Owing to the Vivian mill, which has been doing the ore crushing, being otherwise engaged, the shipments of ore have to be discontinued for the present, and work confined to explorations for further resources, and something better than lower grade ore, perhaps.

UNION MINE.—In the Union mine, near the foot of the White Hill, Sielas Reynolds and Tom Treglow have a good body of ore in sight. These men have enough ore now out to enable them to make a shipment with the addition of what will be taken out in another day or two.

GOULD AND CURRY.—The crosscut east, next to the Savage line has been extended 50 feet during the past week, giving a total length of 278 feet. The general vein of formation looks very favorable and promising.

YELLOW JACKET.—The middle portion of the old upper workings, about the 400 level, makes a very good showing in the way of good regular yield, and the general character of the mine shows improvement.

MONTE CRISTO.—The mill being shut down at present, no ore is being extracted from the mine, but development work is going ahead with a view to future milling and bullion production.

ALTA.—A shift of men continue working in the explorations in the 900 level, taking out small stringers and bunches of fair grade ore, and looking for something better.

BEST AND BELCHER.—On the 1,000 level, crosscut No. 1 west has been extended 49 feet during the past week, making a total length of 224 feet.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, July 18: The west drift on the sixth level has advanced 14 feet during the week, and the face shows a small streak of ore assaying \$11 per ton. The east drift on this level is in 120 feet. The east drift on the fifth level is in 179 feet. The intermediate, between the fifth and sixth levels and west of the incline, is in 32 feet, and shows a small seam of \$100 ore. The stope above the fifth level are looking much the same and yielding considerable \$70 ore. The west drift on the third level is giving a small amount of ore of fair grade. The intermediate, between the second and third levels and west of the shaft, is turning out considerable ore. This stope has been worked through the second level in several places, and stopes have been started on the ore above that level. The intermediates, between the first and second levels, are giving a small amount of high grade ore. A small amount of fair grade ore is being taken from the west drift on the first level. A bullion shipment was made on Thursday.

Eureka District.

ORE SHIPMENTS.—Eureka *Sentinel*, July 19: Shipments of ore from the surrounding mines to the two reduction works in town are about the same as a week ago. The Prospect Mountain properties are looking very well, and while the shipments from there during the past few days have not been as great as they might have been, yet the number of producing properties is gradually becoming greater. Work is being actively carried on in at least twenty mines in this section, and from nearly one-half of them ore is being extracted for shipment. Among the properties there that have sent down ore to the Richmond furnaces during the past five days are Dunderberg, 11 tons, and the Home Ticket, 5. The Adams Hill properties are doing good work, there having been shipped to the Richmond works from the Wide West 35 tons; the Altoona, five sacks of \$400 ore, and the Silver Lick, 26 tons. To the Eureka Con. furnace the Bowman shipped 4 tons. The Jackson mine, on Ruby Hill, sent to the same furnace 37½ tons, and the Albion 24½. The Bay State mine, Newark District, sent in 24 tons of \$300 ore to the Richmond works, and the Myntner mine, Silverado, shipped 4½ tons of rich ore. The Blue Run mine, Secret Canyon, also sent in to the same works a ton and a half. Sixteen sacks of high grade ore were received at the Eureka Con. furnace from some Mineral Hill properties, and 10 tons of ore were brought in from White Pine District to the Richmond works.

Golconda District.

MANGANESE MINING.—*Silver State*, July 19: J. R. Jennings is at Golconda, making arrange-

ment, to commence work on the manganese mines in that vicinity. The mines are about three miles from Golconda, and, perhaps, half that distance from the railroad. They are accessible for teams, and Mr. Jennings, who is acting for Virginia City men, says he can readily dispose of all the ore that he can ship, as it is in demand for making steel.

Tuscarora District.

INDEPENDENCE.—*Times-Review*, July 17: The usual progress has been made with the work the past week, and there is no material change worth reporting.

NORTH BELLE ISLE.—Work the past week has been confined to cleaning out and repairing the chute leading from the 150 to the 300-foot level.

BELLE ISLE.—Crosscut west from the west vein, 350-foot level, has been extended a total distance of 92 feet. East crosscut from the north drift, 150-foot level, has been extended 16 feet.

GRAND PRIZE.—During the past week the south drift in the 200-foot level has been extended 25 feet, the 300 level 30 feet, and the 400 level 25 feet. Stopes continue to furnish a full supply of ore for the mill. No material change to report in any part of the mine, everything going ahead all right at the mine and mill.

NAVAJO.—Crosscut and drifts on the 650-foot level were extended the past week 53 feet. North drift on the east lateral vein has been advanced a total distance of 148 feet, the face showing a large width of vein matter; south drift, same vein, 272 feet. The vein at this point is showing a better character of quartz, but the assays run low. The flow of water at this point has increased. No. 2 crosscut east, from the north drift, has been extended 58 feet and work suspended. The rock has been very hard, and no mineralized vein encountered. Are preparing to start a drift south, on the west vein, 92 feet west of the shaft.

GOLD HILL.—Quite a number of the boys have gone off prospecting through the mountains south of here in search of adventure and cooler weather. In those claims not fully under cover it is impossible to work, and as a consequence no surface prospecting is being done. On the contrary, where shelter from the sun is obtainable work is being pushed with more or less vigor. Standard, as usual is keeping the lead, developing continually, and extracting ore only as they advance. Treasure Box is beginning to loom up as one of the future bonanzas of the camp and the vein continues to hold out as well as ever, and gives promise of eventually proving one of the biggest veins in the camp. The shaft will, in all probability be continued to the 100 level, water permitting. Work has been commenced on the Under Dog, but it is too early to report progress. Nothing is being done on any of the bonanza silver claims. Work, it is expected, will be commenced soon on the Lone Hand. Messrs. Clark and Derbyshire had hardly got thoroughly warmed up to their work when they struck a large body of very rich ore which promises to be a permanent thing. Shaft is down 20 feet and the vein, which is broken up as yet, shows up strongly, being three feet between walls and widening as depth is attained. Sulphuret ore of a very high grade is encountered in considerable quantity, and pockets are occasionally found of a rich, gray, carbonate ore, resembling that found in the Sierra mines at Lake valley. The carbonates carry but little, if any, lead and appear to exist in quantity. Samples have been sent in for testing but no returns have yet been received. The ledge is nearly what might be termed a blanket vein, and pitches to the southward. Messrs. Clark, Derbyshire and Flood have a six months' lease upon the property, with the option of purchasing the same. About three tons of first-class ore are now on the dump. Work on this claim will be pushed vigorously and additional force put on as fast as circumstances will justify the expenditure.

ARIZONA.

DOING WELL.—Prescott *Courier*, July 19: John Curtin has been doing well in the Tiger mine. He took out several tons of black sulphuret ore. Water is scarce at the Del Pasco. Mill not running. About 1,000 tons of tailings will be worked at the Tuscumia mill. Mr. Dawes appears pleased with the yield of Peck tailings. James Daly and others have given the Yuma mine, Centennial district, Yuma county, a thorough prospecting. The shaft is 100 feet deep; the pay streak runs from 18 inches to two feet in thickness; rock samples \$50.22 to the ton in gold. Sulphurets have not, as yet, been encountered. There are, according to Mr. Wilson, a Prescott assayer, over 2,000 tons of rock in sight. Returns from the Selby smelting works have been received concerning the ore shipped from the Avas Supai mine, situated on Cataract creek, this county. About 10 tons of ore was sent as a venture, which netted over all expenses, \$67.50 per ton. This clearly demonstrates the fact that this mine is of such character that great possibilities may be expected of it and the locality in general, as there are several mines close by the original.

COLORADO.

LEADVILLE SMELTERS.—*Mine, Stock and Rail*, July 19: A few weeks ago we rendered an account of the state of smelting affairs in Leadville. A visit was made this week to the Pueblo works. At the Pueblo Smelting and Refining Company, Mr. Geist was found in Denver, but the works were there to be sure, and what has not been seen for some time, all the furnaces were in blast, thirteen, doing away with not less than 550 tons of ore a day. This running full capacity is evidently due to the momentarily favorable condition of the lead market, which is not expected to last. This running in full is making deep inroads upon ore reserves, and it is doubtful that one week's run is on the beds. The ore receipts, therefore, although large, are not sufficient for the use of full capacity, and it may be argued from this that the war between this and Leadville smelters will go on. At the Colorado Smelting works, Mr. Anton Eilers was perambulating in his garden surrounding his residence, to momentarily seek oblivion of the increasing perplexities of the ore market, which seem to have spread from the lead ore transactions to the silicious elements. When dry ores are treated as low as five dollars per ton, refractory ores will soon be treated at six dollars, and then the best and least profits will have to be made out of—what? The lead ore

supply at the Colorado Smelter is large. Eureka Hill furnishes most of the silicious ore used at these works, the Madonna nearly all the lead except that which comes with the Leadville sulphide. All the four furnaces were in blast. At Denver, the Omaha & Grant Smelting Company are also running full capacity of their eight furnaces. The Terrible mine ore and concentrate is already used. The concentrate is added to the charges from the ore beds like yeast to the dough. The receipts at these works have been very large last month, as the stock on hand has increased 4,000 tons during the last four weeks, notwithstanding the large consumption by the furnaces. All the roasting furnaces, including those of the new hall recently finished are in operation. The tracks in the yards are crowded with cars containing ore, fuel and fluxes. Mr. J. N. Palmer, of Denver, started on Thursday morning for Custer county, to take charge of the Terrible mine and mill for a short term. The Boston and Colorado Smelting Works are not frequently mentioned in these columns because they mainly draw their supply from the same sources and use no lead. The business, however, remains in a prosperous condition. Two McNair furnaces are being erected, and nearly complete, near Denver, on the Denver & South Park. Another smelter is being erected by Mr. Builey, on the D. & K. G., near the exposition hall. It is said to be a process which will revolutionize the smelting industry. A reaction toward conservatism might, however, be more in place. Colorado needs no more smelters than she has now. Still, if anybody can improve upon present methods and processes, let him come forward by all means. A pleasing feature of our review of smelting affairs, made the last three weeks, is the confidence which is shown by so many improvements and new enterprises, and to tell the truth, the grand total of last month's ore supplies to Colorado smelting furnaces is indicative of a prosperous mining season this year. There will be ore enough for everybody, only for carbonate lead ores the demand will be stringent. Roasting operations will, consequently, be extensively increased.

IDAHO.

THE LAKE CREEK CONCENTRATOR.—*Keystone*, July 19: The foundation for the new concentrator at Lake Creek has been laid and work of putting the machinery together is being pushed as rapidly as possible. Wm. Pinney, the superintendent, expects to have the machinery all ready to start up by the first of the month. There will be a force of from 12 to 15 men kept busy in and about the concentrator when it commences running at full capacity, and that will be as soon as completed, as enough ore can be taken from the mines in that neighborhood to keep it running almost indefinitely. It is expected over 100 men will be employed up there upon the different mining properties as soon as the ore can be treated by the new machinery. Lake Creek mines are all good, but the ore being largely of a concentrating character but little has heretofore been accomplished in the ore output from that section. However, the new concentrator will enable large shipments of Lake Creek ore this season.

THE ARGONAUT AND DIXON.—Henry A. Swift has taken a lease on the Argonaut and Dixon mines on Lake creek and has commenced active operations taking out ore and further developing the properties. He sent up seven men and supplies a few days since and expects to send up seven or eight more in a short time, or as soon as they can be put to work at advantage. He will bring down a sample lot of ore to Ketchum to-morrow as a trial lot, and ascertain just how it runs. A galena vein from 3 to 18 inches in width is now in sight in the Argonaut, and a good ore vein is showing up in the Dixon. Mr. Swift will push work on these properties this season.

A \$2,000 CLEAN-UP.—*Wood River Times*, July 19: The *Times* is informed that at the last clean-up of the Camas No. 2 mill a bar of bullion worth over \$2,000 was obtained. If this proves true the mill is doing fully as well as was anticipated. The water-supply proving inadequate, it may be necessary to move the mill to some point on Camp creek, but this will not hurt the reputation of the district to any extent.

MONTANA.

TERRITORIAL NOTES.—*Inter-Mountain*, July 18: The new 50-ton concentrator in the Ten Mile district made its first run last week. Forty-three quartz locations were recorded in Lewis and Clarke counties in June. The Teston smelter, east of Townsend, will be ready for work about the first of August. A. M. Esler will soon commence the erection of a new concentrator on Ten Mile, a few miles west of Helena. John Longmaid has purchased the old Penobscot property, 18 miles west of Helena, for \$40,000. This is the property that once made Nate Vestal wealthy, and which sold for \$350,000. It is rumored that the Gregory smelter and concentrator near Wickes, which have been shut down for several months past, will soon resume operations. Seventy-five men are now employed at the mine. A five-stamp mill has been ordered for the J. B. lode on Quartz creek, Missoula county. Recent assays of the ore from the J. B., show it to be very rich in gold, and the owners are confident that the lead will prove a bonanza. Messrs. Kane, Stevens, Hatt and Noel own the Lexington lode, in Emigrant gulch, Gallatin county. The ore is decomposed free-milling quartz, and carries \$50 in gold to the ton. They have just put up an arastra, worked by a 12-foot overshot wheel, which they will begin operating in a few days.

NEW MEXICO.

GENERAL MINING MATTERS.—*Silver City Enterprise*, July 17: Pumping machinery has been put up at the St. Louis mine. The Lake Valley Press states that the company at that place will resume operations in about six weeks. Juniper Springs district is expected to contribute a considerable amount of ore to the Silver City concentrating and reduction works. It is probable that work will be resumed on the Golden Rule mine in the near future. An arrangement has been formed between the directors of the Old Dominion Company, of Globe, and interested parties in the East, looking to resumption of work at the mine and smelter. It is probable that arrangements will soon be made whereby work will be commenced on the Houston &

Thomas property, at Pinos Altos. This is undoubtedly one of the largest lead mines in the Territory, and when ore can be shipped from the mine to Chicago at a profit, there is no reason why it should longer remain idle, now that we have taken it home. Mr. Harsch, of Leadville, has taken hold of the Caribou mine at Fleming, and is now sinking and timbering a double-compartment shaft. He will also put in a Cornish pump, after which he will thoroughly develop and prospect the lower workings of the mine. Should there be found a sufficient amount of water in the Caribou to justify, no doubt the Old Man Company will erect a mill at Fleming, as they have an abundance of second-grade ore which could be treated at the mine at a profit. There is now more activity among the mills at Silver City than at any other period in the history of the town. The Bremen is running steadily day and night, crushing and concentrating from twelve to fifteen tons of ore per day. At the Flagler works the roaster has been completed, and the works are now prepared to treat all kinds and grades of ore successfully. Exceedingly low grades of ore can be treated by the new lixiviation process now in successful operation at these works. The vanners of the Silver City concentrating and smelting works, were put in motion on Tuesday. Mr. Shoefelt is now prepared to buy, treat or sample any kind or grade of ore. He has already bought a number of second-class dumps at Lone Mountain and other places, and says he is satisfied that he will not lack for ore. This new plant consists of three True vanners, ten stamps, a crusher, Cornish rolls and a rapid concentrator. Parties who desire to ship their ore to other markets can have the same sampled at a small cost before shipping. There is no longer any reason why the miners of this section should complain for lack of an ore market.

OREGON.

THE QUARTZ MINES.—*Jacksonville Times*, July 19: Prospecting continues in nearly every mining district. Ore from the quartz ledge of Grob, Braendel & Co., on Jackson creek is prospecting very well and the vein is increasing in size. Neitz Bros. and E. B. Caton returned a few days since from Galice creek where they located a number of claims. They say that the Yank ledge has been located for miles, and more means have been received from San Francisco to push work upon it. There is a probability of several quartz mills being set up in Southern Oregon the coming season. This would open a new era in this section, rich in minerals but undeveloped because of the lack of capital.

BUILDING A RESERVOIR.—A few days since Captain Ankeny returned to Portland from Southern Oregon, where he has been superintending the construction of a large reservoir in connection with the Sterling mine, of which he is the principal owner. He states that the reservoir is now up 20 feet, and the water is being used to make a cut in which to lay the flumes. They have 60 boxes in now, and expect to put in 120 boxes before bedrock is reached. It is expected that the work will be completed by October 1st. The reservoir, when completed, will be 50 feet high, and will furnish an adequate supply of water to run the mine.

UTAH.

REVIEW.—*Salt Lake Tribune*, July 18: The week has been sultry, with one of the heaviest storms ever known here in July. The Signal Service recorded a temperature of 98 degrees on the 14th, and 100 the next day. We believe these figures to be unprecedented in the meteorological reports here. The shipments of the metals from this city for the week ending Saturday, July 11th, inclusive, were 2,471,971 pounds. These figures include some shipments made in fact before the date given, but not reported till then. The receipts of bullion and ore in this city for the week ending July 15th, inclusive, were \$32,078.44, in aggregate of which \$66,592.44 was bullion and \$15,486.00 ore. The week previous the receipts were \$73,246.10 of bullion and \$14,072.00 of ore, a total of \$87,318.10. The Ontario shipped the current week 45 bars of bullion, valued at \$29,702.44; total output this year to date, \$868,039.65. There is considerable activity in the Ontario and vicinity this season; the true course of the ledge, at a distance from the Ontario ground, is better defined than ever before, and confidence in its great extent and continued richness is higher than ever. The Vienna sent down from Sawtooth, Idaho, three bars of bullion on the 9th, valued at \$5,650. The product of the Hanauer smelter for the week was 10 cars of bullion, \$27,200—a splendid week's run. The Stormont yielded for the week from its sandstones, \$3,340. Ore receipts were \$5,686 from the Honerine and \$2,700 from the Crescent, Utah; \$5,500 from the Queen of the Hills, Idaho, and \$1,600 of Nevada ores.

VIOLA.—*Salt Lake Tribune*, July 19: The Viola mine and adjacent towns are taking on a brighter look, and the prospect is that ere long there will be a boom in real estate and a lasting one as well. On the first of July workmen began grading off a smelter site, and in a few days work will be given to many more. Machinery for a smelter of two 40-ton stacks is on the road, and also for a tramway. It is probable that the tunnel will be finished and everything ready for operations to begin before winter, and when the smelter does start it will run steadily, for winter will make no difference in working these mines. A number of Italians arrived a week ago, and went to cutting wood and burning coal. Lots are being taken up, houses are being built, and several new lines of business will be opened. Texas Company is also coming to the front; a smelter will be built inside of three months, the different mine owners having subscribed \$1,500 towards the purchase of it. Sharkey, Chamberlain & Co., owners of the Copper Queen, thirty miles below Junction, are considering an offer of \$50,000 for their property.

STAR AND MILFORD.—Since the advance in the price of lead, shipments of ores to Salt Lake have become more numerous. The Rebel mine makes a shipment this week of 151 tons of lead ores. The Lucky Boy, Nabob, Blue Bird, Talisman, Stalwart, Don and a number of others make an aggregate shipment of 100 tons more. All the claims in Star, Beaver Lake and Bradshaw districts, that are now being worked, never looked more encouraging, and as soon as we can get our quartz ores worked cheaply we will make a bigger showing than ever in the history of mining in Beaver county.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

18 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, an GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)

This form of Ore Feeder is well adapted for its peculiar work.

Manufacturers of the Celebrated "Challenge" Ore Feeders for any character of ores; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ores.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices - 47 Roee St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast - Joseph H. Dorety, 529 Commercial St. S. F.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

PATENT

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning
and Salivation

The most perfect appliance for people engaged in
Smelting, Dry Crushing, Guano Works,
Quicksilver Mines, Lead Corroding, and all
other occupations where there is dust, poisonous vapor,
or bad odor.

In Feeding Threshing Machines, and simi-
lar work, they are indispensable, as no foreign substances
can be inhaled when they are worn.

The Respirators are sold subject to approval after trial
and if not satisfactory the price will be refunded. Price,
\$3.00 each or \$30.00 per dozen. Sent post-paid to any
address on receipt of price.

Address communications and orders to

Mining Share Market.

Our stock tables show what few fluctuations have occurred during the week past. The market remains rather quiet, awaiting, as has been the case for a long time, the progress of developments.

There is very little to be told in the way of news in the general mining situation along the Comstock. The most significant item is the first shipment of bullion from the Hale and Norcross for many years. This consisted of two handsome bars or bricks of silver and gold bullion, worth, according to assay valuation, \$5,027.

The delay in bonanza ore developments, consequent upon these preparations and operations in the way of deeper sinking, has naturally caused a temporary stand-still in the stock market. The annual election of the Savage Mining Company had no influence in the matter, as it was known that the control was not and would not be changed, and that the old officers would be re-elected, there being no contest. As before remarked, the Hale and Norcross is the king-pin and single standard of the mining situation, and the prices of all other Comstock mines necessarily are, and have to be, gauged by that one mine alone. Having no other deep working mine to compete with, it naturally establishes its own price in the speculative public estimation.

Denver Business Notes.

THE HENDEY & MEYER ENGINEERING CO. are having a large call for their Man's Patent Automatic Cut-off Engine. In the action of the valves this engine embraces an entirely new principle in the art of steam engineering, and unites simplicity of construction, sensitiveness to a variation of load, great economy, smallness of cost, smoothness of running and perfection of design, workmanship and materials used in making it. The manufacturing department of this company is under the sole management of Mr. Arthur Hendey, who, besides being a good business man is a thorough and practical machinist.

JAMES W. JACKSON, one of our most enterprising manufacturers of and dealer in mining machinery, has just shipped the last car-load of machinery to the celebrated Sovereign mine, situated on North Star mountain, Park county. The plant consists of three sets (largest size) Cornish rolls, the shells of which are made of a peculiar mixture of iron, discovered and used by Mr. Jackson, for which are claimed superiority of hardness and wearing properties; one Blake and one Dodge crusher, 9x15; twelve Hartz gigs, all run by a patent adjustable cut-off engine, 18x36. The machinery alone for the plant will cost upwards of \$30,000, and it will have a capacity to treat upwards of 200 tons per day.

Bullion Shipments.

Clipper and Silver Bow, July 14, \$20,000; Barber's Mill, 19, \$7,020; King, 19, \$3,224; Stormont, 15, \$3,340; Hanauer, 16, \$3,200; Ontario, 16, \$29,702; Queen of the Hills, 17, \$2,916; Hanauer, 17, \$3,300; Hanauer, 18, \$7,200. The banks of Salt Lake report the receipt for the week ending July 15th, inclusive, of \$6,592.44 in bullion, and \$15,486 in ore, a total of \$22,078.44.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the measure it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTLE—California.
A. G. KNOX—Ventura and Los Angeles Co's.
G. W. INOALS—Arizona.
E. L. RICHARDS—San Diego Co.
F. W. SMITH—El Dorado and Placer Co's.
W. B. TURNER—Oregon.
GEO. McDOWELL—Fresno and Tulare Co's.

THE range of mountains between the Comstock and Walker River, taking in Como, Red Canyon, Silver Lake, Silver Glance and Wellington Districts, is yet undeveloped. In Red Canyon surface prospectors are taking out some of the richest rock ever found on the Pacific Coast, and Silver Glance probably shows a better record for the amount of work done than any gold district in California.—*Carson Free Lance.*

MULLER'S pebble spectacles are the best. 135 Montgomery St., near Bush, opposite Occidental Hotel.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") has been "successfully popular" as it is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Lignature; Systems of the Crucible Assay; Preliminary Assay; Dressing the Ore; Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay by Cupellation; To Assay by the Blowpipe; To Assay of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth. Price, \$1. postpaid. Sent by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Assay of Silver; Assay of Silver Manipulation; etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by Dewey & Co., Publishers, No. 252 Market St., S. F. These are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Satisfactory, Etc.

NOGALES, A. T., May 27, 1885.

MESSRS. DEWEY & CO., Gents.—Yours of the 18th of May enclosing notice of allowance of my application for a patent for "Process of Treatment of Nickel and Cobalt Ores," was duly received. It is extremely satisfactory, and I must say I am surprised at the rapidity with which you have accomplished a result which I expected would have taken six months or a year to reach.

Yours, very respectfully, C. H. AARON.

Gold Mines For Sale.

Two small gold mines for sale, in Kern county, California. One has paid by arastra \$20 per ton. Worked to a depth of 60 feet. The vein is 15 inches wide. The mines are within seven miles of the Southern Pacific Railroad. The owner is not in a position to develop them without aid. The purchase price is very reasonable and there is a good opening for any one to take hold of the claims and work them. Address W. L., P. O. Box 2361, San Francisco.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postpaid, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252 Market St., S. F.

FOR WEEK ENDING JULY 14, 1885.

322,092.—GRAIN DRIER—Geo. Cottrell, S. F.
322,055.—COT-BED—O. C. Fisk, San Bernardino, Cal.
322,171.—LADDER—R. Furlong, Saucelito, Cal.
321,962.—STRAP AND WAIST BAND FOR PANTALOONS—H. Goodman, San Luis Obispo, Cal.
322,099.—BRAKE BLOCK HOLDER—D. Hedrick, Greenville, Cal.
322,106.—STACKING MACHINE—Byron Jackson, S. F.
322,109.—VEHICLE RUNNING GEAR—R. T. Killey, Tres Pinos, Cal.
322,118.—THRASHER AND SEPARATOR—D. C. Matteson, Stockton, Cal.
322,006.—CONCRETE MINER—E. L. Ransome, S. F.
322,012.—SAFETY BRIDLE—Otto Schrader, Alameda, Cal.
322,135.—THRASHING CYLINDER—E. C. Souney, Sacramento, Cal.
322,123.—WELDING COMPOUND—E. Watkins, Eagleville, Cal.

NOTE.—Copies of U. S. and foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

THRASHER AND SEPARATOR.—Don C. Matteson, Stockton. No. 322,118. Dated July 14, 1885. The improvements consist mainly in novel devices for transporting the grain and straw from the threshing cylinder and separating them from each other, and also in appliances for more perfectly separating the grain from the chaff and other impurities with which it may be charged.

RUNNING GEAR FOR VEHICLES.—Robert T. Killey, Tres Pinos, San Benito Co. No. 322,109. Dated July 14, 1885. This invention consists in certain details of construction of the running gear of vehicles. In this gear he has horizontally cranked axles, and links pivoted to said axles at their upper ends and supporting the springs at their lower ends, combined with the coil couplings, secured to the front axle by the same belt which holds the links in place.

GRAIN DRIER.—George Cottrell, S. F. No. 322,092. Dated July 14, 1885. This is a drying-kiln specially intended for drying and cooking oats. It consists in an upper chamber or hearth, having for a hot air pan, a lower chamber or hearth communicating with the upper and having a hot air pan for a hot air, and peculiar endless and adjustable rakes, one on each compartment. It consists further in an adjustable feedhopper, the construction of the rakes and means for adjusting them, means for adjusting the steam and hot air pans, and in the general arrangement of the kiln. The travel of the oat through the hearths may be regulated by adjusting the speed of the rakes or by varying the inclination of the flanges or teeth. When these latter are set at a small angle, they advance the oats less than when set at a greater angle.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing no cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.</

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

EDWARD A. RIX & CO.,

MANUFACTURER,

...SOLE MANUFACTURERS OF...

KENDALL'S PATENT QUARTZ MILLS.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that claimed for it and give entire satisfaction.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept. 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

THIS CUT REPRESENTS OUR
IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1880, Dec. 22 1874, Sept. 2, 1870, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished by order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

**JENKINS PATENT VALVES.****Gate, Globe, Angle, Check and Safety.**

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

Number 5.

Tin.

Tin is advancing in price after having been, like lead and copper, way down to bedrock for a long time. The price is now about what it was in May, 1883, when stocks were more than 3,000 tons in excess of what they are to-day. There are now about 13,000 tons on hand. Of the tin deposits in the Straits it is said the British companies cannot work at a profit even at present prices. With the claims in the hands of the other companies in the same locality it is different, for the cheap Chinese labor allows them to go on. The Chinaman is therefore "getting away with" the Briton in tin mining. In Australia many sets have been abandoned, and this shows a diminished supply from there. It is stated that a "ring" has been keeping the price down and is now ready to let it rise.

In Cornwall the mining community are feeling that the "turn of the tide" has come, that the period of adversity has been doomed, and that the silver lining of the cloud is now seen. Not only does the advance in tin inspire people there with confidence in existing mines, but there is reason to believe that capital would freely enter Cornwall in the prosecution of a number of abandoned sets that many believe would pay for resuscitation. Still, black tin is not sufficiently high even now to admit of nearly all Cornish mines paying, but it will make a considerable difference to many concerns. The *London Mining Journal* says: With the price £60 per ton Cornish tin mining would prosper, and not only would the adventurer benefit, but this price would allow of the poorly paid and hard-working miners receiving something like their just deserts. We venture to predict that should tin remain where it is—and we reassert that we believe it will—the surface laborers in most of the mines will benefit, and most of the meetings to be held from this date are certain to show what a difference in credits a few pounds increase in tin mean. First, referring to South Frances meeting, on Thursday, we observe that had the price obtained on the last sale of tin—£51. 12s. 6d.—been realized at the commencement of the 16 weeks, there would have been an increased profit of some £700, or £7. 10s. advance. Then Wheal Grenville meeting, on Tuesday, will show a very satisfactory profit. Last meeting of this mine was for 16 weeks, and the dividend was 2s. 2d. per share. This time the meeting is a 12-weekly one, and the profit is £1620. 10s. This would give a dividend of 5s. per share, and permit of £120 being carried forward. The average price of tin has been £48 per ton.

NO USE TRYING TO OSTRACISE SILVER.—Being principally a gold producing country not much would it damage California were the monometallic standard to be adopted by our Government. But that has nothing to do with the justice or the expediency of such measure as affecting the interests of the whole country, on which its operation could be only disastrous. We fail to hear of any glut of silver coin on this coast. On the contrary, it appears to be rather scarce, our merchants being often unable to get enough of it to make change. Silver cannot be demonetized in these United States, and it is useless to further agitate the question. What the people don't want they will probably decline to have forced upon them, whatever presidents, secretaries and financiers may think it.

Dow's Mining Shaft Pump.

At the Dow Steam Pump Works in this city several varieties of pump made under the Dow patents are manufactured. They have been largely introduced and proved very effective machines. The valve movement is peculiar and enables the pumps to run smoothly under the highest possible lift. They possess superior advantage for deep mining. The pumps are constructed upon the templet or interchangeable system, and therefore duplicate parts which fit exactly can be procured.

The engravings on this page show Dow's improved sinking pumps, vertical-pattern, and

when desired, the utility of which is an important consideration in sinking a shaft, as it not only consumes the exhaust steam, avoiding the use of exhaust pipes leading out of the mine, or the damaging effect on the timbering if allowed to escape into the shaft, but is so constructed as to increase the efficiency of the pump by doing more work with a given amount of steam. These pumps are made in various sizes from 61 to 408 gallons a minute, at ordinary speed.

PAVING STONES BETTER THAN GOLD OR SILVER.—Charles Francis Adams, Jr., is reported to have said on a recent occasion that the pre-

DOW'S DOUBLE ACTING PUMP FOR MINE SHAFTS.

double-acting, for mining, sinking shafts, deep wells, etc. This pump is rapidly gaining favor in mining operations and excavation work, owing to its light weight, portability, and the limited space required for its operation. The action is perfectly reliable, and delivers a steady, continuous stream of water; doing the work quietly and without jar. It will not do injury to the timbering, if attached, or to itself while working suspended from tackle.

The positive valve movement is used on these pumps, which enables them to operate perfectly in any position, whether suspended from the ring bolt attached to the steam cylinder head, banging on timbers by means of the adjustable dogs provided for the purpose, or placed horizontally. The plunger barrel is easily removed, and a new one substituted in a few minutes. All parts are fitted to gauge and are interchangeable.

Improved suction condensers are attached

ent stagnation of business in Colorado is due to the manner in which the deposits of coal, iron and paving stones in that State have been neglected in the insane search for gold and silver. Now, the occasion on which Mr. Adams made this statement was probably an after-dinner speech, when his heart had been made glad and his reason become a little obfuscated by a glass of wine; hence, its foolishness. We opine the very converse of this remark would be true—such would certainly be the case were it applied to California or almost any other portion of our mining territory. Paving stones, forsooth! What amount of revenue does the man suppose these Coloradans could derive from such a source? There might, of course, arise this possible use for these misales: if an insurrection should occur out in the Rockies the malcontents might use them for barricades; they might also be convenient at such a time to hurl at the police. We await the paving stone boom!

A New Work on the California Gold Mines.

We here take occasion to call the attention of the business community to the fact that a new book on the subject of gold mining in California is now in course of preparation and will soon make its appearance. The work is in good hands, being prepared by competent parties and published by the old firm of Geo. Spaulding & Co., of this city. As we understand it, the book will be devoted mainly to an exposition of the auriferous resources of this State, their extent and variety, the facilities at hand for their profitable development, and the necessity that exists for utilizing them to a greater extent than is now being done. That this class of our resources is very great, and that they have of late years been too much neglected, must be conceded. Our people, their attention having been largely engrossed by other pursuits, seem to have almost forgotten that California was once a gold-producing country. The billion and a quarter of the royal metal taken out here the most of them have heard of, but it seems to them of no great significance—a sort of legend, inconsequential and of little practical importance. Having themselves never been much in the mines, or consisting, perhaps, largely of the new generation, they do not properly appreciate the value of this industry; know little about the enterprise it fostered and the energy it developed; the trade it built up, and the life it imparted to every other pursuit; the prosperity it brought to California, and the wealth it diffused throughout the world.

Of a score or more of our leading capitalists, merchants, manufacturers and other business men consulted not long since as to the means that in their opinion should be adopted for working some improvement in the then depressed condition of business, but one of them, Governor Perkins, even so much as alluded to gold mining as an industry entitled to mention in its bearing upon the subject calling for consideration. Much stress was laid upon our relations with Mexico, our insignificant trade with Central and South America, and a variety of other not very weighty matters, but hardly a word was said about extending aid or giving encouragement to this great ally to all our other material interests and factor of production.

We have here in California not only the greatest extent of auriferous territory of any country in the world, but the deposits exist here under conditions incomparably favorable, and in so neglecting these deposits we are losing the benefits of an industrial element that, properly availed of, would contribute more than almost any other to advance our physical well-being. As a means of promoting this end the book above mentioned ought to meet with such substantial aid as will enable the publishers to issue and put in circulation a large edition thereof. The general Government has, during the past eighteen years done a good deal towards advertising to the world the metallic and mineral wealth of California. But we incline to the belief that a work of this kind will be performed with more discrimination and judgment, where carried on as in this case by private parties than if undertaken by the Government. A book is certainly more apt to be marked by unity and system where only a few than where many persons are employed in getting it up.

CORRESPONDENCE.

A Mining Lesson.

EDITORS PRESS:—All who know the history of Dos Cabezas mining district, in Cochise county, Arizona, will admit that it is one of the most unfortunate camps on the Pacific Coast. Though discovered and organized seven years ago, it is to-day more dead and pauperized than any other not wholly abandoned mining settlement in the whole country. As this state of matters is due in a great measure to blunders, exaggerations, stupidity, trickery, blackmailing and greed on the part of its pioneer prospectors and operators, it may serve a public purpose to let the light of day shine on the mottled picture. If the district had no lodes of promise within its bounds it would be useless now to write about it, for a wholly dead mining camp is no more worthy of notice than a dead dog would be. There is a future, however, for Dos Cabezas, because it contains mineral lodes which, as to extent, permanency and ultimate intrinsic value, will not be readily excelled anywhere. This assertion I know will go for little with most of your readers, but it is sure to be verified by developments in coming years.

The First Misfortune

Which befell the district was in its early claimants being "tender-foot" prospectors from the East. Some of these men were discharged soldiers who had come into the Territory to fight Indians. Most of them were lovers of whisky, and though there were good peaceable fellows amongst them, the pioneers in the mass were inclined to be wild and lawless.

With the usual ignorance of "greenhorn" miners, they believed that having secured a gold or silver bearing lode their fortunes were necessarily made and their days of toil and penury at an end.

From the old stage road between Tucson and Silver City, New Mex'co, by way of Apache Pass, the croppings of an immense east and west white quartz lode could be seen two miles away. Anybody could "discover" it, and when the Chiricahua Apaches were put on the San Carlos Reservation it was claimed for several miles. Some of these early locators must have had pre-eminent abilities of a certain kind. They were able to attract the attention of capitalists and created quite a general belief at a distance that it was one of the richest lodes of the country. It was examined by Hayward, Sevenoaks, Barney Hardy, Reese, Bateman and other experts. While its average yield of selected ore was beralded as running from \$60 to \$80 per ton, its bulk, when tested, without regard to occasional pockets of high grade ore, did not exceed \$8, while for long distances there was nothing but virgin quartz in view. The prices asked by the locators would have been large for rich and partially opened lodes, but for mere low grade "prospects" they were wholly beyond the range of mining reason. As a natural result capitalists and experts were tempted to do the district all the injury they could. Having traveled, as it were, a thousand miles to examine and purchase a magnificent horse, valued at a thousand dollars, their disgust at finding the brute worth a bare hundred dollars made them talk in a way to do serious injury to the sellers.

The Next Stage

In the misfortunes of the camp began with the arrival of a railroad operator from Utah, who built a 5-stamp custom gold mill. He was a pleasant sort of man, but if he had been born and reared in Ethiopia he could not have known much less than he did know about quartz milling business. Being heavily in debt his first mill-run, though on good ore, did not seem to cause him any elation, for he forthwith bid the county a long farewell. His monument stands now after four years of exposure, as an old gray ruin in the quartz mill line. Next came

A Live Colonel

From Cincinnati. He was an enterprising genius. He wanted many lodes, and was willing to give the prospector who brought him over from New Mexico a chance to make some money. The price of the best "prospec." he was prepared to purchase was set at \$25, but then as a dozen or two of such claims could be hunted up in a week, he created a diminutive boom along the mineral belt. He sunk shafts, got a 10-stamp mill built in Ohio and erected here when, alas! the discovery was made that there was no ore on which to keep it going. Then an effort was made to get custom ore, but miners asserted that they were cheated, and the supply was cut off. The company then bought a higher priced claim, and though it yielded 109 tons of \$18 ore it was subsequently shut down and the works dismantled because a second run of ore, not so carefully selected, failed to yield satisfactorily. Recently this company opened one of its \$25 lodes and found a body of low grade ore. Under a good mill superintendent, who with commendable judgment had been placed in charge, this ore was made to pay even in a small mill not conveniently placed relatively to the mine, but as the directors were quarreling, and the workmen not paid, the sheriff stepped in to adjust affairs. The company, however, is buying off the in-

debt and being by accident the owner of several really valuable lodes it will some day surmount all its troubles. About four years ago

A Chinese California Company

Bought for \$10,000 a group of lodes which some ranchmen, riding around after stock, had located at intervals. Of this sum, only one-fourth, it was said, went to them, but even then they were wonderfully fortunate as finders of money. The management seemed from the first to act on the principle that a barren quartz vein is sure to get rich if deeply opened. Though the outlay under this hypothesis was great, ore failed to make its appearance, and at last operations were suspended. The company got several of its claims patented, and perhaps a hundred years hence it may be possible to make something out of them. This incorporation deserved a better fate. It did much work, was prompt in its payments, and if it had only begun aright would no doubt have been successful. As it was, it could not have succeeded without a miracle, and that sort of blessing does not often come to stupid miners.

Our Next Adventurers

Were a lawyer and a dry goods merchant from Monticello, Illinois. They bought, mainly on their own judgment, a hillside having streaks of silver ore through the country rock, their theory being that at the depth of 250 feet the small veins would unite and make a grand, rich lode. They paid \$20,000 for the ground, but as the deed called for \$50,000, the former amount probably looked small to them. If the claim-holders had asked \$2,000 for this property it would have been considered unworthy of notice. There are two kinds of Eastern mine-buyers. One regards mining as a lottery and a \$25 claim good enough to begin with; the other supposes that if a prospector asks a low price his lode must be good for nothing. When a sharp miner meets with a buyer of the latter class he "goes for him" on a generous scale. A shaft has been put down on one of the hillside veins 130 feet without any signs of a respectable pay-lode coming in. As four workmen have a \$200 superintendent over them who knows nothing of mining, development is slow and expensive. When work is discontinued on that hillside Dos Cabezas district will undeservedly get another "black eye," but then, it is getting used to such quips of fortune. If there had been any effective mining done on the best lodes of the mineral belt and failure had resulted there would have been no need for my writing this letter. As it is, I claim that the district has never been fairly represented before the mining world. There was a time when capital would have taken hold of its low grade gold lodes and made a success of them, but the opportunity was disregarded. Fortunately, the outcome of the camp is not dependent on its east and west white quartz lode, on which some good mines will yet be opened.

Higher on the mountains than it there are a number of large and most promising lodes in a granite and porphyry formation. Some of their ores are rich in copper alone; others carry gold, copper and silver in paying amounts, and still others are quite rich in gold with a low percentage of copper. That is where the greatest mines of the district will be opened. No efforts are being made to attract capital to them. They will summon attention ere long without special attempts in that direction. One lode in

This Upper Belt

May receive a passing notice, not because it is the best, for that is a point not yet determined, but rather owing to its having a mill in operation. In a wooded ravine, high on the north-west flank of the Dos Cabezas mountains, known as Park canyon, is situated the Maple Grove lode, owned by Fowler and McGregor, its discoverers. At first a comparatively small vein of talc, rich in free gold was found.

As work progressed, other veins of quartz also carrying paying amounts of gold, were exposed, and now it appears that there is an immense lode at that point which, when developed, cannot fail to be a most profitable mine. The owners and several active young relations do the most of the work. They have a five-stamp mill with silvered plate. The ore is paying, and as twenty stamps could be supplied, the future of the property is assured. The lode will be opened by means of its own product, and no begging petitions will be sent to capitalists to come, see and buy it. When a few more of the same kind of mines existing in the district are made productive, its bad name will be forgotten, and capital will want to get in then without solicitation. In the ravine below this lode profitable placer mines have been worked. One nugget worth \$250 was taken out last summer, and several smaller pieces have been found recently. There is an ore in the Maple Grove lode which, on being assayed for silver, was shown to be rich in gold. I send you two small pieces containing spots of this metal. It looks to be an antimonial sulphuret, but its real quality has not been determined. On the smaller piece you will notice gold, surrounded by heavy metal. This richer quality of ore, some of it going as high as \$5,000 per ton, could not be saved on plates, but it will be stored for future treatment.

Conclusion.

My object in writing this letter has been accomplished. It was to say that Dos Cabezas district is not dead, but merely slumbering. It has had to carry a mighty load of mining and milling imbeciles, but the tribe is so nearly extinct now that pioneers who remained under the conviction that sooner or later the merits of

the camp would be recognized are more hopeful than ever. The "blackmailers" who for years tried to sell their own locations by belittling those of others that had brought investors from a distance, having starved themselves out at their dirty work, are now in distant pastures. The saloon keepers sit all day watching the radiating roads, vainly hoping that some thirsty traveler with coin at command may appear. The cows of a neighboring ranchman browse up to the back door of the gamblers' "club-room" without hindrance. The dog fights of booming days are unknown, for dogs with stomachs had to be got out of the way. Poor Dos Cabezas! The somnolence of her town is a pitiable sight, but from it thoughtful men may derive a profitable lesson.

OSCAR DELL.

Roessler's Estimation of Lead by the Humid Method.

[Translated for MINING AND SCIENTIFIC PRESS from the German by CH. A. SCHENK.]

A simple determination of lead by the humid way is as yet unknown. Though the precipitation of lead out of a hydrochloric acid solution by zinc in a loose, spongy form has repeatedly been recommended for this purpose, it was of no practical value on account of the increased affinity of the lead in this State to combine with oxygen, on account of the presence of earthy admixtures and other reasons.

Roessler has now made this method a practical one in alloying the lead, separated by zinc with a weighed amount of Wood's metal (1 gram Bi, 0.5 gr. Pb, 0.25 gr. Sn, 0.25 gr. Cd) which melts at 68°-73°C. From the increased weight of the regulus he determines the amount of lead. A quantity of the alloy weighing 2 grams can take up 1 gr. of lead. But in practice only so much ore should be weighed out that the resulting amount of lead be but little more than 0.5 gr., the alloy becoming less fusible by taking up too much lead.

The resulting beads should not be more than two grams, that they may be weighed on the assay balance.

Considering the foreign admixtures in lead ores the method is as follows: 1. Combinations which contain besides lead no other metals precipitated by zinc. Sulphides, which are not decomposed by boiling hydrochloric acid, as iron pyrites, etc., are also supposed to be absent. Wide test tubes containing from 50 to 60 C.C. are charged with the ore. Each tube is provided with a small funnel, from which the neck has been cut off by means of a file. A glass rod, drawn out to a point at its lower end, passes loosely through the funnel to the bottom of test tube.

Hydrochloric acid of 1.10 sp. gr. is then added to the charge (the amount of acid to be about 30 times the sulphide of lead; in case of carbonate, still more), and the whole heated as long as a reaction of the acid can still be perceived; dilute now with the same amount of water. The tube should not be over half full after this addition of water. It is not necessary, nor can it be recommended, to heat till every trace of sulphureted hydrogen is expelled; on the contrary, it is of decided advantage, as will be explained further on, if sulphureted hydrogen still remains in the mass.

For the precipitation of the lead the tubes are placed in a water bath of about 70° C. temperature, and in each one is thrown a small piece of zinc, weighing about one gramme. Zinc foil is used for this purpose, which can be obtained by pouring zinc which has been melted in a porcelain crucible, under cover of ammonium chloride, from some height into a porcelain plate. Care should now be taken to stir the contents well from time to time. If the generation of hydrogen decreases too much it is only necessary to dig with the point of the glass rod into the loosely precipitated lead to make the action lively again. The well-rinsed funnel is now detached from the tube by drawing it over the glass rod. By this time most of the lead is precipitated and more stirring becomes of importance, which can be better performed if the funnel is not in the way. Another small piece of zinc may be added in this state of the work. When no more hydrogen is evolved a test must be made to determine if there is any more lead in the liquid. For this purpose the tube is taken out of the water-bath and a small piece of magnesium of about 4 sq. m. m. size thrown into it. Care must be taken that the magnesium, by proper shaking, is moved about and comes in contact with all or most of the liquid. The solution is free of lead if the magnesium is completely dissolved. But more zinc must be added in case a small residue swimming on the surface is left, or perhaps a larger black looking globule. The required quantity of zinc to precipitate the still dissolved lead may be estimated by the size of the residue. Metallic magnesium does not precipitate lead out of a hydrochloric acid solution, except in the presence of a salt of zinc, in which case zinc is first separated, which now effects the precipitation of the lead.

The described way of testing for any more lead in the solution is preferable, in the author's opinion, to that with sulphureted hydrogen water for two reasons.

I. It is an easier and more accurate method. II. The contents of the tube, in testing for the presence of lead, with an excess of sulphureted hydrogen water must be poured into the main test-tube with all the rinsing water, in case lead is still present, which operation

would generally increase the volume of liquid so much that there would be hardly room for it in the first test-tube.

When all the lead is precipitated, an examination has to be made for particles of undissolved zinc, which might be enveloped in the spongy mass. For this purpose it is only necessary to dig with the glass rod at different places into the lead; if escaping hydrogen is neither seen nor heard, all the zinc is dissolved.

The operator, if he has satisfied himself in this respect, presses now the spongy lead together with the glass rod and decants the liquid. A loss of lead in this latter operation is not to be feared. The contents of the test-tube should be well shaken before decantation if much earthy matter is present; by using this precaution, most of the latter is poured off with the liquid. Water is now added immediately, so that the lead is just covered by it, and a small amount of precipitated calcium carbonate for nearly neutralizing the free acid, which may still be present.

The analyst has had enough time during the described part of the work to weigh out the several amounts of Wood's metal required for the number of tests and to have them, in order to avoid confusion, properly arranged in a row, corresponding to the order and number of assays. For alloying the lead Wood's metal is now introduced with care, so that it glides slowly to the bottom of the tube. Heating over a small alcohol flame, the lead by means of the glass rod is brought in contact with and pressed into the fused metal, properly shaking the tube at the same time, until all the lead has been taken up by the bead and formed the desired alloy with it. It is evident that this is completed when at last, in shaking the tube, spongy particles of lead are no more observed swimming in the liquid.

The lower end of the test tube is now dipped into cold water, whereby the bead becomes solid, when it is taken out, wiped dry and put in its place.

All the other tests are treated in the same way. The resulting beads are not yet fit to be weighed, containing in their present state always more or less water, which amount, though generally small, between one and two ingrams, may sometimes be much more, so that the operator runs the risk of making considerable errors on this account if he should weigh the beads as they are. The earliest and most practical way to prevent this consists in fusing the alloy once more under slightly acidulated water and pouring it into cold water. For this purpose a beaker is filled with cold water, and a wide test-tube, provided with a disk of cork near the bottom, that the bead dropping into it cannot break through, put into the beaker. In a second test-tube the bead is heated to fusing under very little acidulated water, carefully stirring once more with a glass rod; the test tube in the beaker is now raised with the left hand a little above the surface of the water and the tube with the fused bead brought close to the mouth of the first one. When the metal in getting cold begins to flow slow, which can be easily observed by a slight shaking, drop it quietly into the tube in the left hand. The bead may break into pieces if the metal in transferring is still too hot or becomes jagged or small folds may form on its surface, retaining traces of water. These inconveniences may especially happen if the amount of lead in the ore is only small, and the alloy, consequently, is readily fusible. In following the given directions the amount of water retained will be so small that it cannot influence the weighing. It may nevertheless be advisable, in order to have no doubt, to repeat the last described operation a second time. The determination must be considered correct if the second weighing agrees with the first or is only one or two decigrams less.

It may be well to caution the operator in this place, should he choose to do the drying by heat, the metal puffs up and may spit if it contains the smallest amount of water. This way of drying, therefore, can only be done in well-covered vessels. Two well-fitting watch-glasses enclosing the bead, the whole tared together, are best for the purpose. The heating can be performed on a hot iron plate. It may here be mentioned that the liquid enclosed by the bead is not exactly water but a weak salt solution.

Another Method.

The method, if the ore contains, besides lead, other metals which are precipitated by zinc, excepting antimony, and if it also contains sulphides not decomposed by hydrochloric acid, is as follows: The lead is converted into a sulphate, and the soluble salts are separated by washing. For this purpose a few C. C. of aqua regia are added to the substance in the test-tube; the latter closed with a funnel and the whole mass digested till decomposition is finished. The well rinsed funnel is now taken off, a little sulphuric acid poured in and the assay heated again till thick fumes of this acid appear. If a number of tests has to be made at the same time use for this second heating a small oblong box of sheet-iron and heat from the bottom to the required temperature. The test-tubes are placed in a row in this box, in an inclined position, so that the openings only protrude from slit-formed holes in one of the long sides. In this way the acid is rapidly evaporated and with perfect security. After cooling the test-tube is half filled with water and heated again for some time, to dissolve the soluble sulphates; then filter the clear liquid through a small filter, so that as little as possible of the fixed substance gets on the

(Concluded on page 86.)

MECHANICAL PROGRESS.

DECOMPOSITION OF CAST IRON BY HEAT.—Some experiments of L. Forquignon upon malleable iron led him to suppose that cast-iron, at a temperature somewhat inferior to its melting point, is decomposed into free graphite and a purer carburet of iron. He accordingly heated cast-iron in a vacuum, to a temperature of from 900° to 1,000 C., for several days, without melting or softening. The metal became malleable, and its surface was covered with a dull grayish efflorescence, which produced a mark upon paper or on rough porcelain. The fracture was sometimes of a uniform black, like that of a lead pencil, and sometimes it was dotted with black grains of amorphous graphite, regularly disseminated throughout the mass. It seems probable that this partial decomposition depends upon a tendency to equilibrium between the carbon, the iron and the carburet of iron, the relative proportion of each of these bodies being a function of the temperature. The decomposition of a homogeneous solid into two other solid bodies is a very rare, if not a unique phenomenon. Salt water acts very much like heat in the gradual decomposition of iron. Iron cannons which have lain a great number of years under the sea have become so much decomposed and so soft on being raised to the surface that they could be cut with a knife, and a common cut nail could be readily driven in to them.

A NOVELTY IN MILLING TOOLS.—Messrs. Hetherington & Co., of Manchester, have just constructed, from the special designs of Mr. Claude Carter, the manager of their works, a milling tool carrying seven cutter heads for machining at one setting 13 separate faces on a mule head stock. The machine generally resembles a planing machine, in having a bed table with standards and cross slides, the cutter heads being mounted on the standards and cross slides, in suitable projections, for operating upon the different faces of the mule head stock. Each head stock is driven independently, and allowance is made for changing positions to meet any variations in the construction of the head stocks. One counter shaft in the rear of the standards drives all the head stocks, and these are driven in iraly by belts. The table is fitted with differential feed motion, regulated by a hand wheel, which being turned in one direction gives the slow speed for cutting, and in the reverse direction the quick return motion. The traverse of the machine can be arrested in any position either automatically or by hand. The milling of the 13 faces of a mule head stock can, with this machine, be effected in an hour; whilst with an ordinary planing machine which would require about four different settings, the work would occupy about three days.—*English Paper.*

IMPROVEMENTS IN NAILS.—An improvement in the manufacture of cut nails has been patented at Wheeling, W. Va. This invention provides a new form of die for shaping the nail about the head, so its strength will be reinforced, and thus prevent the heads from being so frequently broken off in driving, as has been the case heretofore. The Russell & Erwin Mfg. Co., of New Britain, Conn., are the patentees of a new wire nail. The shank of this nail is not made smooth, but is made in several tapering or conical sections. That is to say, from the point upward the nail widens for a short distance, is then contracted, and again widens. In this way a series of barbs is formed, which act as ratchet teeth and prevent withdrawal of the nail except by great force. The wire from which the nails are made is prepared with the projections in a continuous strip, and is then cut, headed and pointed. A nail-set which will not slip off from the nail head and bruise the wood has been patented by G. W. Cannon, of Poughkeepsie, N. Y. The working end of the nail-set is made with a very small point or projection, which may be of conical, pyramidal, triangular or other form. The projection is made by filing or turning away the other parts of the face of the nail set before the same is hardened or tempered. In operation the projection enters the soft iron nail head and holds the nail-set in place.

A NEW TOOL FOR MAKING HOLES IN TUBE-SHEETS OF BOILERS AND OTHER PLATE-METAL STRUCTURES has been patented by W. F. Harrison, of Wilmington, Del. The tool is so made as to be readily adjustable for the cutting of holes of different diameters. It comprises two independently-adjustable and laterally-sliding tool-holders, extending through the cutter-head, and provided with cylindrical sockets for the reception of the cutters. A clamping-bar and nut are arranged to simultaneously clamp both the sliding tool holders. Centrally through the head project a cylindrical centering pin or bi provided with cutting teeth at its lower end. The cutters are adjusted radially to the center pin to the required distance by means of the slides, and are then clamped in place. A small hole is punched at the center of the opening to be made, and the cutter being placed in a drill press, the central pin will bore a small cylindrical guide opening, while the cutters will cut a channel through the metal concentric with the guide.

STEEL HOOPS.—The tendency to use steel instead of iron still continues to grow. More than half the current out-turn of some of the hoop firms in England is of steel, and the con-

sumers of stamping and of working-up sheets demand that metal. Steel is also coming more into demand for bridge girders. Civil engineers, both in England and in India, are specifying steel more frequently than heretofore as the material for girders in bridge building. Quite a good contract has recently been received for girders of this class by Messrs. J. Shewell & Co., Darlington. The girders are for India; and the fact that the steel for making them will have to be brought from Scotland is causing the North of England firms to feel more keenly the comparative scarceness of steel of local manufacture.

MANGANESE STEEL.—At a late meeting of the representatives of the coal, iron and hardware industries of Great Britain, the president, Mr. Percy, related an amusing anecdote of the late Mr. Joseph Gillott. He stated that about 40 years ago he and his friend Mr. Gillott were talking together in Birmingham, on the use of manganese by cast steel makers. Mr. Gillott was a native of Sheffield, and had had great experience in the use of steel suitable for steel pens. As soon as the word manganese was mentioned he showed unmistakable signs of mental disturbance, and exclaimed, "Sir, we have never had any good steel since that — manganese" (he omitted the emphatic monosyllable uttered on the occasion) "was introduced at Sheffield."

"There is no doubt," added Mr. Percy, "that there was much inferior iron used in the manufacture of cast steel, which, without the use of manganese, would not have yielded a merchantable product; but at the present time it was essential to the production of serviceable steel by methods most extensively in operation."

In answer to the question whether good steel of any kind could be made without the use of manganese, Mr. Percy replied as follows: "If not, how was the production of steel of the highest quality at Sheffield before manganese was used there to be explained? There were many points touching the manganese steel question which yet required careful investigation."

The day might come, continued the doctor, when the Institute would be induced to consider the expediency of forming a collection of specimens illustrative of special points of interest relating to the manufacture and uses of iron and steel.

THE LARGEST CANNON.—A cannon was cast at Jersey City Foundry July 21st which is claimed to be the biggest piece of ordnance ever built in the world, putting in the shade anything ever made by Krupp. The monster was cast for the New York Pneumatic Dynamite Gun Company, and if the expectations are realized nothing afloat can withstand one of its terrible broadsides. The barrel is sixty feet long, breech loading, weighs 46 tons, of heavy wrought iron, brass-lined throughout, with a full bore of eight inches. It was cast in four sections, each fifteen feet long, with iron collars welded together with stout steel bolts. The barrel is bolted to eight reservoirs, where the compressed air necessary to fire it is stored. Its projectile is equally formidable, carrying a charge of 180 pounds of dynamite. When completed the gun will be tested at Fort Lafayette by the Government Board. The company expect to sell it to Secretary Whitney.

EFFECT OF COAL SMOKE ON IRON.—The western approach of the Callowhill street bridge in Philadelphia, is in a shaky condition. The bridge is an iron one, and its western end spans the tracks of the Pennsylvania Railroad Company at a point where locomotives are continually passing, and it is said that the sulphurous acid from the smoke stacks of the engines has been the cause of the trouble. A great deal of the iron work above the tracks most used is being gradually eaten away, and the ground beneath is thickly strewn with thick iron scales that have dropped from the bridge work, which has not been protected by proper paintings. Several iron posts have been weakened and are bent in such a way as to indicate a slight movement of the bridge to the south. It is estimated that \$12,000 or \$14,000 will be required to restore the bridge to a good condition. The river span, which is not reached by locomotive smoke, is not affected, and is in excellent condition.

SUBJECTS IN REGARD TO WHICH WE ARE IN THE DARK.—In the metallurgy of iron, according to Dr. Percy, there are many subjects as to which we are still sadly in the dark. Who, for instance, could tell what were the physical properties of pure iron after fusion? Who had an accurate knowledge of the properties, chemical as well as physical, of compounds of pure iron and pure silicon in various proportions? Who could give certain information as to the modes of existence of manganese, silicon and phosphorus when present together in pig iron? Who could state positively and explain satisfactorily the *modus operandi* of manganese in the various processes in which it was used by iron and steel manufacturers?

A NEW AND MORE RAPID SEWING MACHINE.—A Brooklyn mechanic has invented a wonderful sewing machine, which, it is claimed, will do 80 per cent more work than any machine now in the market. An experiment with steam power moved it with a speed of 2,200 stitches a minute, and it was started and stopped instantly. It is simple in construction, is easily operated, and sews all kinds of fabrics, from leather to fine linen.

SCIENTIFIC PROGRESS.

An Accelerating Cartridge.

Among the very recent inventions is that of A. S. Lyman, the veteran inventor, of this city, of what may be termed an accelerating cartridge. It consists of an ordinary cartridge shell firmly packed with powder meal, through the center of which is a longitudinal perforation. Powder meal is used in order to compact the explosive into a single piece or block, and prevent the nearly instantaneous ignition which takes place with granulated powder.

When this new cartridge is fired, the ignition begins within the walls of the perforation, slowly at first, owing to the small surface exposed to fire producing a low gas pressure, by which the ball is started; but as ignition proceeds the perforation enlarges with increasing ratio, the charge burns with augmented rapidity, and the gas pressure steadily rises, expending nearly its whole effect upon the ball.

The few experiments thus far made with this novel invention have yielded remarkable results, and they indicate a coming revolution in the range and penetration of projectiles. From a small, smooth bore gun, four feet in length, five-sixteenths inch bore, with a powder charge of nine-tenths of an ounce, made in the new form, a projectile nine inches long, weighing 3½ ounces, has been driven into a target composed of nine plates of boiler iron, each one-fourth inch thick.

Eight of the plates were pierced, the forward end of the projectile then curved upward, boring up within the body of the ninth plate, and making an aggregate penetration of iron by the projectile of over four inches. It is estimated by the patentee that, with a three-inch gun and 40 pounds of powder, a projectile may be sent through a solid iron armor plate three feet thick. Should these expectations be realized by actual experiment, it would seem as if, in the naval battle of the future, the elements of light vessels, great speed, and rapid firing qualities would become prominent.

As to land defenses and military operations in general, radical changes would necessarily follow from the introduction of small arms and artillery having the extraordinary ranges and power which this new invention promises.—*Scientific American.*

EARTHQUAKES AND THE PHYLOXERA.—A curious phenomenon is reported from some of the vineyards in the province of Malaga. According to Spanish papers plants attacked by the phylloxera and given up as practically dead have begun to show marked symptoms of vitality, due, it is believed in the localities, to the destruction of the insect by gases or electrical conditions consequent on the earthquakes in that district. That earthquakes exert a destructive influence on the phylloxera insect of the grape, is the opinion of S. Villalogue, who has told the Paris Academy of Sciences of a vineyard near Malaga which had apparently been destroyed by the parasite, but which vigorously burst into leaf after the recent earthquakes in Southern Spain. The destruction of the phylloxera by earthquakes, if such is the case, is undoubtedly due to certain deleterious gases which are thereby liberated in the lower strata of the earth which find a gradual access to the surface through a crevice thus vertically opened.

RECOVERING VOLATILIZED METALS.—A. F. Wendt, of New York City, has patented an apparatus for recovering the volatilized metals from the smoke or waste gases of blast and other furnaces. The apparatus consists of a horizontal inlet-pipe connected by a series of vertical stand-pipes to a horizontal outlet-pipe. Within each stand-pipe there is placed a cylindrical wire screen reaching from the bottom of the stand-pipe to the upper side of the outlet-pipe. The screens are braced in proper manner, and are set in a sand packing below and in a flanged ring above. Suitable openings in the inlet-pipe, directly below the stand pipes, permit the withdrawal of the metallic deposits from time to time. As the gases pass through the screens, the metal will be deposited in a finely divided state, and may be removed by sharply tapping the screens and opening the lids over the discharge opening. The gases that have passed through the apparatus are said to be clean and to burn with a clear blue flame, without appreciable smoke.

THE SENSE OF TASTE AND SMELL.—How much of the pleasure of living comes from the exercise of the little considered sense of taste or that of smell it is hard to estimate. Harriet Martineau, the English authoress, seems to have been one of the few persons having no sense of taste, as a recent writer asserts that she was entirely destitute of it. She reported that the faculty came to her once, when the deliciousness of a leg of mutton aroused an eager anticipation of the enjoyment of her next dinner; but nothing came of it, for her tasting power was withdrawn as suddenly as it had been given. The sense of smell was also denied her, as it was Wordsworth. In his case the lacking sense also appeared on a single occasion, when he "smelled a hean field and thought it heaven."

TEMPERATURE AND THE HUMAN BODY.—Travelers in polar regions have survived exposure to a cold as great as 75° below zero, Fahrenheit.

On the other hand, the inhabitants of some parts of the globe are forced to endure at certain periods a natural temperature considerably higher than 100° above zero. A still greater heat—greater even than 200°—may be borne by the human body for a short time. Brewster mentions that Chantry and five or six friends remained two minutes in the sculptor's drying furnace, bringing out a thermometer which stood at 320°. Chantry's workmen entered the furnace when the temperature was as high as 240°.

WHY THE SWISS CAN DRINK SO MUCH.—Owing to the small proportion of moisture in mountain air and the low barometric pressure, evaporation is very rapid. Even after the heaviest rain the ground dries in a few hours. This quality of the air tends to make perspiration more profuse and the skin dry faster than in the case at lower elevations. There is greater thirst, the tissues waste faster, and a high authority has said that a man's tissue is the only thing which it is his duty to waste, new tissue being out of all comparison better than old. It is probable this rapid evaporation at great heights, and the thirst which it engenders that the Swiss have to thank for their wonderful drinking powers. The other week the marksmen of Canton Vaud held their annual rifle meeting at Payerne, a picturesque village on the Broye, and the local papers mention with something like pride that the shooters and their friends drank the place dry. Everybody who has been in the Highlands of Scotland, or any other mountain land, and tried the experiment, knows that he can drink with impunity much more whisky, or whatever the vi du pays may be, than he can drink at home. This, it may be as well to observe, is mentioned as a dry fact, not as an additional reason for going to the mountains.—*London Times.*

THE PHILOSOPHY OF FLAME.—In the study of furnaces, Mr. F. Siemens says that large ones must replace small ones. He claims to have proven that solid substances interfere with the formation of flame, and that flame injures solid substances with which it comes in contact. To account for the phenomena he advances, preferably, an electric hypothesis. Accordingly he explains flame as the result of an infinite number of exceedingly minute electrical flashes, the flashes being due to the very swift motion of gaseous particles, and a solid body which opposes itself to these flashes is cut by them, while the motion being more or less arrested by the solid body the flame is damped. Mr. Siemens insists, therefore, that flame must not be allowed to impinge on bodies to be heated, but must simply heat the bodies by radiation, and furnaces must be so constructed as to allow the flame to develop out of contact not only with the substance on its bed, but with the walls and roof of the furnace itself.

MOUNTAINS OF THE MOON.—Many readers are aware that the mountains and hollows of the moon have been accurately and thoroughly mapped by astronomers, and baptized by appropriate names. For the benefit of students of astronomical geography, we subjoin the names of all those which have been christened. Mountains—the Appennines, the Caucasus, the Alps, Taurus, Bamus, the Altai Mountains, the Cordilleras, the Rhiphe Mountains, the Carpathians, the Hercynian Mountains. Hollows or valleys—the Chisian Sea, the Sea of Fertility, the Sea of Nectar, the Tranquil Sea, the Sereno Sea, the Sea of Dreams, the Sea of Death, the Dreamy Marsh, the Cold Sea, the Sea of Vapors, the Middle Bay, the Sea of Clouds, the Sea of Mist, the Bay of Epidemics, the Stormy Ocean, the Showery Sea, the Sea of Rainbows, the Sea of Dews, Humboldt's Sea.

FORESTS AND TEMPERATURE.—Prof. Muttrich, of Berlin, has reached the following conclusion from his forest meteorological researches: (1) That the forest exercises a positive influence on the temperature of the air; (2) that the daily variations of temperature are lessened by the forest, and in summer more than winter; (3) that the influence of the leafy forest is in summer greater than that of the pine forest, while in winter the tempering influence of the pine forest preponderates over that of the defoliated forest. An attempt to determine the influence of the forest on the mean annual temperature led to no sure results.

INTERESTING EXPERIMENT.—A sheet of ordinary paper warmed in front of a fire, will, in a dark place, give a very decided electric spark upon the application of the knuckle, with a crackling sound. Place a sheet of gold leaf between two sheets of paper thus electrified, and pass a pencil point over them in a zig zag course, and a luminous flash quite strong will appear.

ELECTRICITY AND BOILER INCORUSTATION.—Experiments have been made in France with electricity as an agent to prevent the incrustation of boilers. The passage of a current through the boiler not only causes the impurities of the water to settle as loose powder, but detaches the old incrustation.

GUN COTTON AS A MOTOR.—A motor driven by small charges of gun cotton is an English novelty. It is said to be applicable wherever small powers are required.

A NEW ASTEROID.—No. 237 was discovered at the Vienna Observatory on the 29th of June by Dr. Palisa. It is of the twelfth magnitude.

TABLE OF CONTENTS.

EDITORIALS.—Tin; Dow's Mining Shaft Pump; A New Work on the California Gold Mines, 81. Passing Events; Chicago Dolor; Steel Cruiser; New Water Pressure Engines for Mines, 84. North and Middle Forks of the American River, 85.

ILLUSTRATIONS.—Dow's Double Acting Pump for Mine Shafts, 81. North and Middle Forks of the American River, 85.

CORRESPONDENCE.—A Mining Lesson, 82. MECHANICAL PROGRESS.—Decomposition of Cast Iron by Heat; A Novelty in Milling Tools; Improvements in Nails; Steel Hoops; Manganese Steel; The Largest Cannon; Effect of Coal Smoke on Iron; Subjects in regard to Which we are in the Dark; A New and More Rapid Sewing Machine, 83.

SCIENTIFIC PROGRESS.—An Accelerating Cartridge; Earthquakes and the Phylloxera; Recovering Volatilized Metals; The Sense of Taste and Smell; Temperature and the Human Body; Why the Swiss Can Drink So Much; The Philosophy of Flame; Mountains of the Moon; Forests and Temperature; Interesting Experiment; Electricity and Boiler Incrustation; Gun Cotton as a Motor; A New Asteroid, 85. USEFUL INFORMATION.—The Four Largest Incomes; Natural Soap; Pyrotechnics; The Great Eastern and Noah's Ark; English Elm; Chinese Bandoline; Visiting Cards; Bicycles; Varnishes and Paints; Miles of Pipe, 87.

GOOD HEALTH.—The "Work" in Going Upstairs; Poisoned by Flies; Whooping Cough; Cure for Biliousness; Cause of Bright's Disease; Disinfectants; Sunstroke; A Warning to Drinkers, 87.

MISCELLANEOUS.—Roessler's Estimation of Lead by the Humid Method, 82. Treatment of Dry and Base Silver Ores, 86. El Dorado County Notes, 87.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 88-89.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 92.

Passing Events.

Surveying the entire field, there is apparent just now an unusual activity in the business of mining for the precious metals on this coast. Receiving papers, communications and verbal reports from all parts of the country, we are enabled to form a pretty accurate judgment as to the situation, which denotes a confidence in mining circles never before so obvious as just now. The miners, claim owners, as well as workmen, appear to be pretty well satisfied with their condition and prospects. The dwellers in Arizona seem to have a good opinion of that Territory. They who tarry in Nevada like the sage-brush; the Gentiles in the sterile mountains of Utah take to the land of the Saints, and so on through the entire list of mining States and Territories. A great contentment seems to pervade those who sojourn there, all believing the place where their lot has been cast, or their enterprise has carried them, to be preferable to any other. This is as it should be, since men not only enjoy themselves the best, but accomplish the most who are satisfied with their surroundings. Moreover, there is nothing to be gained by miners in a country where things, taken as a whole, are so evenly balanced, shifting their places of abode in the hope that much is to be gained thereby. The industrious and frugal can do

well enough almost anywhere in this land of the Far West, those who fail heing, as a general thing, themselves most to blame.

We have elsewhere spoken of the general condition of mining affairs in California, the same heing healthful and the outlook all that could be asked for. Over in Nevada, viewing the State at large, the state of things is not quite so cheerful; on the Comstock, however, a good deal of work is heing done and with better results, or at least better prospects than have attended operations there for some time past. All the mills that have water are running. The ore, it is true, is of low grade, but it affords some profit. A great many men are now heing employed in these mines, and more would be if a larger number of mills could be kept running. With this increased output and reduction of ore, business in Virginia City has improved to a corresponding degree, and the place has put on a more lively appearance.

Chicago Dolor.

It appears from the Chicago papers that business in California is at present very bad. If such is the case it is time the people of this State were advised of the fact. The year is now well advanced, and yet we have been living on in profound ignorance of the true condition of things, fancying ourselves comfortable and fairly prosperous, whereas we have been all the while fluttering on the very verge of bankruptcy—real estate depressed, our factories closed, trade annihilated and the gold mines "played out"—are, in short, a dead-broke, gone-in community. This is deplorable, but now that we have found out how it is, nothing remains hut to go into liquidation and make an assignment for the benefit of our creditors, deporting ourselves as hecomms a people so impoverished, afflicted and essentially used up. This is clearly what will have to be done, unless, to he sure, our Chicago friends have been drawing on their imagination for their facts, or some wag has been guying them sadly, for we can assure these good people that California, everything considered, never seemed in a more prosperous condition than at this very time.

Be that, however, as it may, there is this much to be observed: there have occurred in this State during this present year fewer business failures than in any other part of the country. We have had none of those riots growing out of labor strikes, such as have been common of late all over the East, and as are just now rife in Chicago, Cleveland and neighboring cities. We have here no great masses of men clamoring for work or fighting against a reduction of wages, all who desire employment being able to get it and to earn enough to subsist them decently. If in San Francisco building has been greatly overdone, there stands yet this fact that rents are nearly twice as high here as in Chicago. There may have occurred in this city such tumble in the prices of real estate as these Eastern journals describe, but if so the extensive sales recently effected in this line of property fail to show it.

It is true this cereal crops have this year fallen considerably below the average. But for all that we shall have many thousand tons of wheat to spare after supplying all home requirements. It is, moreover, the case that the completion of overland railroads on the north and the south has somewhat curtailed the trade of San Francisco in these quarters. But this loss is not serious, and is heing fast repaired by our growth of population, due to immigration and natural increase. For the same reason, territory that formerly obtained its machinery here is now getting it in part from Western cities. But this, while it has diminished orders with our foundrymen and machine builders, has caused none of these establishments to close up, nor will it prove of more than temporary inconvenience.

The fact is, the resources and industries of California are so varied that even though some pursuits be much depressed, those that remain unaffected suffice to maintain the general prosperity very nearly at its common level.

Thus, while our grain crop is this year a trifle short, this shortage is hut little felt, heing made up by an abundant vintage and an average yield of vegetables and fruits of nearly every kind. Then we have other sustaining and staying industries, such as dairying, wool and stock raising, our lumber, manufacturing and fisheries, with innumerable smaller pur-

suits, not to mention gold and silver mining, which, so far from "heing played out," are to-day yielding more satisfactory returns than ever before. We heg, then, our Chicago friends not to worry about California. She is getting along very comfortably, despite the few drawbacks mentioned, and which are hardly more than we require as counter irritants to too much prosperity.

We only wish the inhabitants of Illinois and the city by the lake were as well off as the people of San Francisco and the Pacific Coast generally. We grieve that this is not so. It pains us to hear of the business failures, the stoppage of rolling mills, factories and other works; the closing of coal and iron mines; the falling off in railroad earnings; the high death rates, poor living and low wages; the idleness, suffering and want, and the general industrial depression everywhere noticeable in the States east of the Rocky mountains. Our sympathies go out in a special way for the street-car strikers who, after standing out to the point of starvation, have been forced to accept the old wage of \$12 for seven days' work of 17 hours duration each, with only 20 minutes for meals, enough, no doubt, for the scanty fare the poor fellows get. A company who would force men to work on terms like these would be indicted and convicted of a public offense in San Francisco. And yet, incredible as it may seem, there is score of applicants for every one of these overworked, ill-paid positions.

Out in the country the laborer fares even worse, receiving during harvest but 90 cents per day, finding himself; at other seasons of the year his pay amounts to hardly more than 50 cents per day, with sometimes a sack of corn or slash of "sow-helly" thrown in. Harvest hands receive in California from \$1.75 to \$2 per day and board, at other times farm hands are paid from \$25 to \$35 per month, board and lodging included; most other kinds of labor heing paid in this same proportion.

New Water-Pressure Engine for Mines.

Mr. J. N. S. Williams of this city, has just received a patent through the MINING AND SCIENTIFIC PRESS Patent Agency for an improved water-pressure engine. It consists of two or more cylinders having pistons, two or more series of valves for admitting and exhausting the liquid, a connection between said valves and cylinders, and a mechanism by which the piston of one cylinder operates the valves connected with and operating the piston of the other cylinder. It consists, further, in the construction of the valve-chests, and in the series of inclined planes heing arranged upon sliding bars connected with the pistons in such a manner that when the pressure valve is open the exhaust valve is shut, and vice-versa.

The style of valve gear in Mr. Williams' engine is cheap and simple, doing away with the costly system of hydraulic rams and the complicated piping necessary on the single-acting water-pressure engines that are in use. Further, the motions of the pistons being, as it were, at right angles to each other, the motion derived from them is steady and uniform to a degree not attained in any other construction.

In mines the object of this engine is to do away with the cumbersome shear-rod and substitute a column of water, thereby affecting a marked improvement in economy of working and repairs, and also cheapening the construction of such works. In its application to such pumping machinery, the discharge column of water being in constant motion, the heavy shocks due to the water column coming to rest and being set in motion again, as in the ordinary systems of pumping, are entirely done away with, it is claimed, and thus allowing the constructor to make his pipes of less strong material, there heing no liability to failure, owing to the steady motion in the discharge column.

The valves may be plain disks with springs or they may be slide, rotary or puppet valves, as may be most convenient in practice, and this mode of lifting the valves may be either inclined planes or by a combination of jointed levers, or by cams rotated by the most convenient way.

The whole construction of the engine is novel and useful when applied to pumps that require to be placed underground, as in mines and other industrial works of a similar nature. It may also be applied to winding engines, ventilating-fans, and all purposes requiring the conversion of rectilinear into circular motion.

Steel Cruisers.

A Proposal from a San Francisco Firm.

Among the proposals submitted to the Navy Department at Washington, for building the new cruisers authorized by Congress, was one from the Union Iron Works of this city the only private shipyard that offered to build. Plans were submitted to the department, after careful consideration of recently constructed vessels of the class. An outline of the proposal is as follows:

Main deck at or about the water line covering the boilers and engines; armament on the spar or upper deck, with full poop and forecastle decks to work bow and stern guns; not less than three-fourths sail power; coal bunker capacity for a full power run of 3,000 miles in eight days; capacity for a half power run of 5,000 miles in sixteen days; capacity for a one-third power run of 6,700 miles in twenty-four days.

In working out the plans to obtain results as stated above, we have reached a displacement of 4,750 tons, with the draught of water forward at 20 feet; aft 22 feet 6 inches. This allows for the weight of hull, exclusive of armament, ship stores, war stores, etc., 1,950 tons. Boiler and engines, including pumps, pipes, ventilation, etc., 1,040 tons; coals in bunkers, 1,100 tons; armament and stores of all kinds, 660 tons. This maximum power to be developed under the best conditions of weather and with the best fuel and skillful management would be 6,000-horse. In making the computations for speed, we have allowed 500 horse-power margin, and taken the full power at 5,500, the result heing as follows: Displacement, 4,750 tons; draught of water forward, 20 feet; draught of water aft, 20 feet 6 inches.

From calculations an estimate of a full power speed of 17 knots is reached. In order to have the machinery practically under the water-line the horizontal type of engine is adopted, this arrangement providing for three distinct compound surface condensing engines, acting on three cranks set at an angle of 120 degrees with each other, each part of each engine to be a duplicate of the corresponding part of the other engines; thus one spare crank shaft would fit any of the three engines—the same with pistons, piston-rods, valve stems, etc. The boilers are arranged in two fire-rooms, six boilers in each compartment, the steam pipe through the after-boiler compartment to be in a water-tight case, so that steam could be used from this forward boiler should the after fire-room be flooded. A water-hallast compartment is arranged under the engines to hold about two hundred tons. This would be filled when the coal was burned out of the bunkers. The bunker capacity, as shown on the plans, is about eleven hundred tons, arranged on each side of the boiler and engine space and across the forward end of the same. All the bunkers are water-tight compartments with drop doors. The rig, as shown by the rigging plan, is that of a four-masted ship, heing square rigged on three masts with a polk-gigger, all parts and sails for the three masts being duplicates of each other, all top-sails and topgallant sails interchangeable. The poop and forecastle-decks would be arranged to receive say 8 or 9-ton guns, while the broadside would consist of six 6-ton guns.

Construction of the Hull.

The construction of the hull is of the usual type, frames spaced 24 inches, with additional girder frames, spaced 10 feet apart, as shown in the plans, and all the other scantlings fully up to the requirements of the registering societies. The vessel is fitted with a rainbow and well backed by intercostal plating, extending to the first or collision bulkhead. There will be two complete steel decks and all the main bulkheads will extend to the upper deck.

No special design for armament was made. There will be three distinct condensers, as shown on the plans, one for each engine, the cooling surface in each condenser to be 3,860 square feet.

There will be 12 single ended steel boilers, each 12 feet six inches diameter and 10 feet 6 inches long, each boiler to have three furnaces opening into a common combustion chamber.

Everything experimental in boilers, engines, etc., or in their arrangement, has been avoided. The Union Iron Works managers are satisfied that this vessel can be built, exclusive of armament, stores, furniture or any spare parts, for the sum authorized by Congress to be spent.

The Union Iron Works are perfectly competent to undertake this task and it is greatly to be hoped that the Department will look favorably on their proposals. Their new plant was partly designed for just such work and they have all the necessary facilities.

North and Middle Forks of the American River.

We present here a map* of the north and middle forks of the American river, including the "Divide," between them, as the high ridges that separate large streams in California are frequently called. The territory represented covers an area a little more than ten miles square—say 120 square miles. Hardly anywhere else throughout the entire range of our gold fields could a like scope of country be selected marked by so much worthy our attention, whether we regard the extent, variety and richness of its mineral resources or the historic interest that attaches to it. Here every form of gold-bearing deposit found in California is met with, and here have occurred some of the most romantic incidents and tragic events connected with the mining annals of pioneer days. The dotted belt crossing the map diagonally from northeast to southwest indicates the course of one of the Pliocene or "dead rivers" that here traverses the country. This is the main channel which has many branches less distinctly shown on the map. A large portion of the "Divide" is, in fact, ramified with the confluent of the "dead river" here laid down, fragments of them being found at Iowa Hill, Grizzly Flat, Yankee Jims, Deadwood and elsewhere on the ridge. Not only so, but later developments tend to establish the existence of two, if not three, channels, occurring at various depths, the one above the other, along or near the path of the one here seen. As regards

The Hydrography of This Region.

While it has been pretty accurately sketched by our artist, is slightly at fault in one or two particulars. What is put down on the map as the west fork of the North Fork should have been made the north fork of that stream. The two considerable confluent running off easterly from the middle fork, as displayed on the map, have in reality no existence. There are deep canyons there through which run winter torrents, but no large or permanent streams. The style of designating the larger branches of the rivers, as adopted in California, is well illustrated on this map. We have, to begin with, the main trunk of the American river, not here shown. This river divides itself first, into a north, a middle and a south fork, each of these forks dividing themselves again in the same manner. Thus, we have the north fork of the North Fork, the middle fork of the North Fork, the south fork of the North Fork, and so on through the whole category, there being many other large rivers in the State which with their tributaries are divided up in the same way. These rivers run in deep, narrow, and precipitous canyons, the latter ranging from 1,200 to 1,600 feet in depth, their sides having an average slope of 40 degrees. Even some of their smaller tributaries, such as Indian, Shirt-tail and Humbug canyons, are from 1,000 to 1,200 feet deep along their lower portions, with banks quite as steep as the main rivers.

A mile a half above Colfax, on the north bank of the American river is the noted locality known as "Cape Horn," consisting of a bluff point along the side of which the railroad bed has been excavated at a height of 1,500 feet above the river, of which a good view can be had from the cars when rounding this point. On this Divide stand

The Mining Hamlets

Of Damascus, Bath, Forest Hill and Todd's Valley, all but Damascus, much more populous many years ago than they are at present. Michigan Bluff, which stands on a branch or feeder of the main channel, and near the latter, has lost much of its ancient importance, the mines in the vicinity, worked mostly by the hydraulic process, being now about exhausted. Of Todd's Valley, also at one time a large and lively town, very little is now left. Ranked by population, the towns on this "Divide" stand in the following order: Iowa Hill and vicinity, 1,000 to 1,200 inhabitants, Forest Hill, Bath, Michigan Bluff and Damascus, 600 to 800, the miners working in the immediate neighborhood of each being included. Thirty years ago Yankee Jim's was the most flourishing town on the ridge; it is now about obliterated. This same remark applying also in good measure to Wisconsin Hill. The rich mines worked near

*From the report of H. C. Burchard, Director of the Mint.

Forest Hill gave to that place such importance that it imparted its name to the entire ridge between the two forks, commonly called the "Forest Hill Divide."

The Mines on This "Divide"

And along the rivers that bound it on two sides, have been among the richest ever found in the State. Even as early as 1848 some mining was carried on along these rivers, and in a few instances also in the gulches up on the ridge. Some work was done that year on most of the larger bars along the Middle Fork, as high up as the main branches of that stream. Very little, however, was done that year on the north fork of the American.

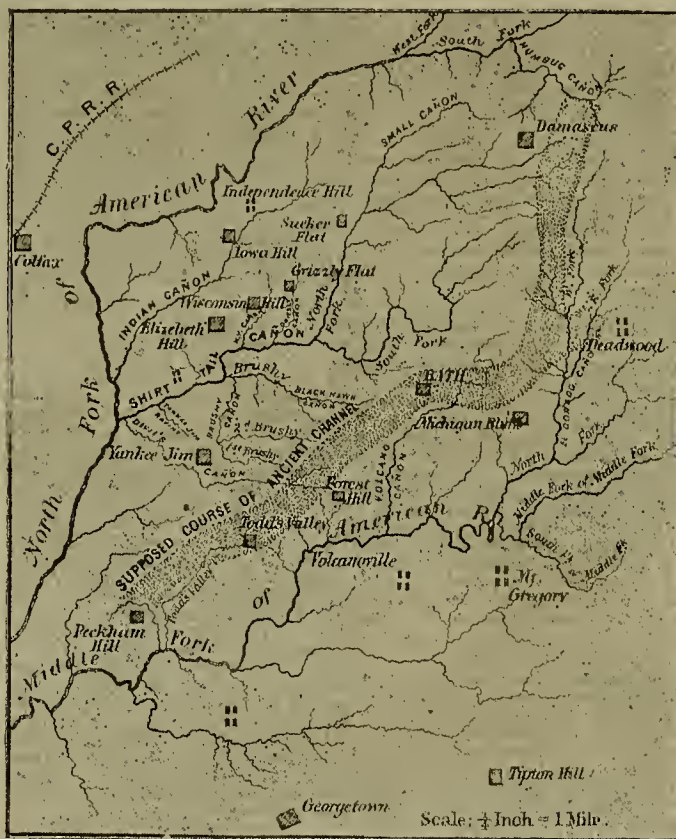

In the fall of 1848 a company of miners struck into Shirttail canyon, and for several months took out gold by the pound. Having consumed all their provisions, they left early in the winter, taking with them as much gold as they could carry. Though they did not expect to return themselves, they concluded they would so mark the spot that others could find it should they meet with any desirous of doing so. Now there had in the fall of '48 been quite a heavy trail worn along the "Divide" by miners

means, it can hardly fail to prove a great success. Indian canyon, the next considerable gulch to the north of Shirt-tail, had in like manner been filled with these gold-bearing slums. A few years ago it was emptied of its contents by a similar process, and paid well, profitable washing still being in progress there.

All the ravines and gulches on the Forest Hill Divide, as well as the bars along the rivers on either hand have richly rewarded, not only a first but in many cases a second and in some instances even a third working. Most of the drift operations here have also proved exceedingly profitable, some of the claims now being worked by this method, turning out gold almost beyond precedent. The Hidden Treasure ground at Sunny South, not far from Damascus, the Weske, near Michigan Bluff, and the Mayflower, in the vicinity of Forest Hill, are all yielding with an affluence that would have been no discredit to the flush days of gold mining.

If time and space would permit, it would afford us a pleasure to recall and fully describe some of the more interesting

Incidents and Legends, Pertaining to this Forest Hill "Divide" and

NORTH AND MIDDLE FORKS OF THE AMERICAN RIVER.

going to points above on the Middle Fork. This trail kept near the crest of the ridge, a little higher up than Todd's Valley, passing near where Forest Hill and Bath now stand, and thence on to Michigan Bluff, where it made its descent to the Middle Fork. When these miners on coming out from their rich diggings struck this main trail they put up there on a pole the remnants of an old shirt to denote the turning off place in going to these diggings. From this incident the canyon took its name, which, despite its uncouthness and some efforts made to change it, has stuck to the locality ever since. We can testify of our own knowledge that the above is the true origin of this outlandish name. In passing up the ridge in the spring of '49 we saw the garment still there, stretched on the pole after the manner of a scarecrow in a farmer's cornfield. Later in the summer it disappeared and with it this more tangible evidence as to how the deep and gloomy gorge came to receive such strange baptism.

Being the outlet to several hydraulic mines, this canyon came to be filled with tailings to a great depth many years ago, a rocky obstruction near its mouth having prevented their escape. This barrier is at the present time being removed and a sluice laid down along the canyon for the purpose of running out and rewashing these tailings, which are known to contain great quantities of gold. As the enterprise is in the hands of energetic parties having ample

localities immediately adjacent. Long will the packer and others, who in '49 traveled up and down this "Divide," have reason to remember Todd's Valley and this—not for the reason that any special good luck or dire calamity there happened to them, but because this was the only place where a white woman and frolicking children, and dogs and cats and cows could be seen, and a square meal be obtained at that day; comforts all made possible and so brought within the reach of the '49er by Jim Williams, who, in the summer of '48, leaving Santa Cruz and taking with him his family and domestic animals, repaired to this valley and there put up a stockade cabin, whereat man and beast were afterwards entertained in royal style. Now, Jim Williams was a Missourian by birth, but having killed a man in his native State, found it expedient to emigrate, which he did, first going to the Indian Territory, and later coming on to California. In this killing he was not, it seems, altogether to blame, but enough to hame to render further residence in his old home uncomfortable; hence his removal. But in coming away Williams was not the man to leave his family behind. He gathered them up, even to his mother-in-law and his wife's two sisters, very comely maidens, and brought them all out into the wilderness with him. As he was called the "Indian Fighter," it would look as if he must have been engaged sometime or another in savage warfare. But about this his guests never

found out anything definite, albeit Williams was a great talker. Now, at the period we are speaking of, this man was living as above related, and his cabin being the only place in this whole country where a christian meal could be had, few going up or down the ridge ever passed without calling—the result was, Williams made money—so much that the next year he sold out the place to one Dr. Todd, and with his numerous household returned to Santa Cruz, his successor coming in and giving his name to this valley.

Located on this middle fork, near its junction with the main river, is

Murderers' Bar,

On which six young men from Oregon were, in the month of May, 1849, killed by the Indians—hence the name. Further up on the south fork, near Kelsey's Diggings, one of the Kelsey brothers was in like manner killed the same year. By reason of these and other murders committed by the Indians, a party went out from Sutter's Mill, and having corralled a lot of the savages brought them in to the mill, where, after a sort of a trial was had, some dozen or more of the bucks were shot.

Jim Greenwood, the Mountaineer.

Had our map been extended a little further south it would have taken in the site of the famous old mill where gold was first discovered in California; also the town of Greenwood, situated in Greenwood's valley, both named after old Jim Greenwood, about the best specimen of a mountaineer and trapper that ever wore buckskin hunting shirt and moccasins. In the spring of '49 Greenwood was living with his family, which consisted mainly of numerous horses, a retinue of dogs, and several boys, at the old mill, where he was a noted character, both because of his striking personal appearance, and the large quantities of whisky he was capable of consuming without any visible effect. He had left his home in Missouri when a youth, and spent his whole after life in the service of the various fur companies, hunting and trapping in the Rocky mountains, having also served as a guide to some of the expeditions sent out by the General Government to explore the regions of the great Northwest. He was full of anecdotes and a good talker, though prone, after the manner of his kind, to paint events in vivid colors.

Though over seventy years of age when living at the mill he got about with the agility of youth and could still handle his rifle with unerring precision. That summer he left the mill, and taking his dogs, boys, traps and other things, of which he had not many, moved over to a little valley between the south and middle forks and putting up a cabin made there his future home, his death occurring a few years afterwards. His boys by his Indian wife, a Crow woman, were handsome, bright little fellows, though with the bringing up they got, they did not all turn out well. With the exception of one, Todd by name, they are all dead now. The survivor is, or was not long since, living in Humboldt county, California, a good citizen and well liked by all who know him. The valley remains, but the town of Greenwood has shared the fate common to so many of the early settlements in the mining regions. Alluding to

A Legend or Two More

And our running and disjointed remarks must be brought to a close: On the south bank of the Middle Fork, a little below Todd's Valley is "Jack Greary's Grave." Poor fellow, he came of a rich family somewhere in the East, was highly educated, of gentlemanly address and good appearance, but he died poor and alone—starved to death in his cabin hard by the Middle Fork, where we found his remains and interred them as well as we could, putting up a rude cross over the spot, which thence on was known as "Jack Greary's Grave." But the grave nor the cabin is there any more. They occupied fatal ground—ground, that containing gold, has since been washed off, and with it all there was left to mark the last resting place and perpetuate the memory of the unfortunate young man. That his friends ever learned anything of his fate is not at all probable, as all we could glean about him or them was the above scanty information, gathered from a drunken companion that we afterwards came across and who had deserted him in his extremity.

Further up the middle fork, but on the same side, under a towering pine tree that overlooks the canyon, is the grave of Roswell Partridge, who died near that spot in the fall of '49, under circumstances of the most sad and pathetic kind. Just forinst Jack Greary's grave, a company of sailors—but why recall other of these mournful reminiscences, to continue which to the end would be but to write another "Book of Lamentations," so many are they and so sad their recital? Never in time will they all be chronicled—never will the world know how many perished, one way and another, during these pioneer times; nor ever will the waiting ones at home learn what has become of the lost.

Roessler's Estimation of Lead by the Humid Method.

(Continued from page 82.)

filter; wash the residue containing the lead repeatedly with sulphuric acid water, till all the soluble parts are washed out, which may be ascertained by a special test. Place now the test-tube with the lead sulphate under the funnel; pour about 10 C. C. of hot hydrochloric acid (1.10 spe. gr.) in small portions on the filter, and wash with 10 C. C. of hot water. The smallest quantity of lead sulphate, which in decantation might have remained on the filter, is saved in this way and added to that in the test-tube. Out of the hydrochloric acid solution the lead is now separated by zinc and alloyed, etc., in the manner described. Add a small amount of sulphuretted hydrogen to the wash water for rinsing the funnel with the neck cut off, toward the end of the lead precipitation. By taking this precaution the tendency of the lead is diminished to enter into solution again, after the excess of zinc is dissolved.

As the latter point is of some importance in this method of determining lead, it may be well to consider it a little more closely. When lead is precipitated by zinc and any excess of the latter metal has disappeared, it can be noticed at once that the lead is now also inclined to dissolve in the acid liquid. The surface of the spongy mass becomes covered with small bubbles, which rise slowly and without any noise, with more or less energy, according to temperature and amount of free acid present. Supposing, for instance, that it has been shown by the magnesium test that all the lead is precipitated, and the same test is repeated after some time, then the formation of a small black globule will be observed, which clearly demonstrates the necessity of pouring the liquid from the precipitated lead as soon as the excess of zinc has been dissolved. This tendency of the lead to dissolve again is diminished if only a little sulphuretted hydrogen is present, and on this account was it advised not to expel the last traces of the latter gas in treating the ore with hydrochloric acid.

Although sulphuretted hydrogen can by no means protect the lead against the action of an acid liquid, its presence will yet be of benefit in retarding this action and decreasing an error from this source, in case it has been neglected to pour the solution in time from the metal precipitated.

Silver, if present in the ore remains with the lead sulphate and increases its weight, introducing thereby an error, if the precaution of using nitric acid free of chlorine, instead of aqua regia has not been taken.

Method When Lead and Antimony are in the Ore.

Antimony enters into the hydrochloric acid solution, out of which it is also precipitated by zinc, and would be taken up in part by Wood's metal, if it were not separated from the lead. Chloride of antimony volatilizes at about 230° C, whereas it needs a much higher temperature for the evaporation of the lead chloride. No lead is lost in evaporating the chloride of antimony. The work is accordingly done as follows:

Add to the substance under examination and charged into a porcelain crucible of about 50 C. C. volume, the necessary amount of hydrochloric acid and digest to perfect decomposition, the crucible being covered with a watch glass. Rinse the watch-glass into the crucible, evaporate to dryness, being careful to have no loss, and heat the residue at 230° C, as long as fumes are seen to escape.

If now the residue contains besides lead no other metals precipitated by zinc, loosen the dry mass by means of a glass rod from the sides of the crucible, and transfer it to the test-tube, wherein the separation of the lead is performed. Rinse crucible first with 10 C. C. of hot hydrochloric acid, and then with 10 C. C. of water, pouring the washings into the test tube.

If, on the other side, it is necessary to convert the lead into a sulphate after the described separation of antimony, on account of the presence of other metals which are also precipitated by zinc, proceed as follows: Add to the residue in the crucible a small quantity of aqua regia, and also some sulphuric acid; heat under cover of watch-glass, take off the watch-glass and rinse it when the mass is quietly fusing, and keep on heating till the fumes of sulphuric acid appear. Add water after cooling, heat again a short time to dissolve the soluble sulphates, and decant after settling to a small filter. Transfer now the contents of crucible into the test-tube, wherein the lead is to be precipitated, using for this purpose sulphuric acid water. Finish in test-tube by repeated decantation, the washing out of all soluble salts. Proceed now as already described, not forgetting to rinse the crucible with the required measure of hydrochloric before pouring it on the filter.

It need scarcely be mentioned that the heads obtained in the work can be regenerated and used over again by alloying them with the required quantities of bismuth, cadmium and tin, to compensate for the addition of lead. For this purpose each head after weighing is wrapped up in a piece of paper, marked with the amount of lead taken up. If now new portions of Wood's metal are needed for other tests, get the sum of the lead from wrappers and determine therefrom at once each separate amount of the other constituents to be fused with the beads on hand.

The results obtained by this method have been very satisfactory, especially if the percent

age of the earthy admixtures in the ore was low. They may be a little too low if the said percentage is high. It takes more time in this case to take up the lead in the alloy than it does if the ore is purer, on account of the surplus of earthy substance present. A small loss of cadmium may be caused thereby, the fused metal being longer in the slightly acid liquid.

Treatment of Dry and Base Silver Ores.

Progress in Dry-Crushing Silver Mills.

The following article, by C. A. Stetefeldt, appeared in the last annual report of the Director of the Mint:

It is not intended, in this paper, to treat the above subject in an exhaustive manner, but only to point out, in a general way, what progress has been made, and to call attention to recent improvements which eventually must create a revolution in this special branch of metallurgy.

The distinctively American dry-crushing silver mill came into existence about the year 1865, after the discovery of the Reese River mines in Nevada. What had been done previously on the Comstock was simply to copy the Freiberg barrel amalgamation. The substitution of the pan for the barrel forms the real starting point of deviation from old methods. In discussing the progressive steps taken in the construction of dry-crushing silver mills I will consider each one of the different parts of the plant by itself.

Breaking of the Ore as it Comes from the Mine.

Blake's crusher, first introduced for breaking ore in silver mills in Colorado in 1864, and since then in use all over the civilized world, marks the adoption of a principle for breaking ore which, in its application, is so simple, effective, and economical that I doubt if it will ever be superseded by any other. The idea has been taken up by many other inventors, and whatever the merits of their improvements may be, they have not achieved any important results which call for special commendation. Even in those crushers in which the jaws have received a circular form the acting principle is essentially the same.

Drying of the Crushed Ore.

The old-fashioned dry-kiln, consisting of heated flues covered with iron plates, has almost completely disappeared, at least in most mills of more recent construction. It has been replaced by the revolving dry-kiln, first introduced about 1875, where I have not been able to ascertain. There is not only much labor and fuel saved, but the moisture is more completely removed, which is essential for dry-crushing, and the annoyance of a hot floor, so unhealthy to the laborer, is avoided. A new style of drier, the shelf dry-kiln, first built at Lexington mill, Montana, in 1882, is rapidly gaining favor. Its mode of working being automatic, by gravitation, it dispenses with power. It also does away with dust-chambers, and occupies less space for equal capacity than the revolving dry-kiln.

The Crushing of the Dry Ore.

In the dry crushing of ores progress has been very slow until late, in spite of the numerous efforts made in this direction. A few years ago the idea prevailed with all experienced millwrights that the California stamp battery would keep the field as the only suitable apparatus for producing fine pulp. This assumption was based upon the fact that all machines the construction of which had been based upon other principles failed to accomplish what was claimed for them. Hence all efforts were directed to make the stamp battery as effective and durable as possible. The increase in weight of the stamps, the increased number of drops, changes in the shape of cams and mortars, the introduction of cast-steel shoes and dies, and of self-feeders, and also of improved guides, were the principal results. The stamp-battery still remains the most troublesome part of the mill plant. It is true that the battery of to-day is far superior to that of twenty years ago, not only in efficiency and durability, but in auxiliary appointments. The dusty chamber in front of the battery, where the pulp accumulated, and which had to be entered by a laborer to load a car, has given way to elegant conveyors and elevators, which remove the pulp continuously and take it to the roasting furnaces. Dust-chambers now connect with the battery-housing into which the dust, formerly escaping from every opening and settling upon machinery, is drawn by a suction-fan, to be regained, and finally mixed with the pulp before it enters the roasting furnaces. Machinery has also been perfected for the separate crushing and feeding of the salt, this being of advantage in some respects. The first decisive

Departure in Pulverizing Ores Dry

Was made by the introduction of Krom's rolls at the Bertrand mill, Nevada, in 1882. While rolls had been generally used for pulverizing ores for the purpose of concentration, it remained for Mr. Krom to construct rolls suitable for producing pulp for subsequent treatment by roasting and amalgamation or lixiviation. By providing the rolls with steel tires, running them at the high speed of 100 revolutions per minute, with pulleys only, and constructing them in a most substantial manner generally, he succeeded where others had failed. Leaving, for the moment, the purely economical question out of view, I will consider the phys-

ical difference which exists between pulp produced by each of the two machines. If pulp produced by rolls, or by stamps, is sifted through the same size of screen, the ore particles from the former are more uniform in size than those from the latter. The pulp from the rolls contains much less of such fine material which will pass, say, through a No. 100 wire screen, down to impalpable dust. Based upon experience in raw amalgamation, it was formerly assumed that the production of an impalpable powder was essential to success, even in case the ore had to be roasted before amalgamation. Hence it was the general practice to crush through a No. 80 or No. 60 screen in the older mills of Nevada. While this practice was gradually abandoned, and crushing through No. 40, and finally No. 30, screen was in most mills adopted, the subject was never fully investigated until recently. It has been found that for chloridizing roasting great fineness of the ore is entirely unnecessary, and that it is actually injurious in the amalgamation of roasted silver ores. Of course, the character of the ore has always to be taken into consideration. In the lixiviation process a large percentage of fine material interferes seriously with rapid filtration, and unnecessarily lengthens the time of working a charge. From this it follows that ore pulverized by rolls is mechanically in a more favorable condition than if stamps have been used. I now turn to

The Question of Economy.

A discussion of the subject which is complete and thorough, and compares the efficiency of rolls and stamps under varying conditions, is not possible at present, because the available statistics concerning rolls are confined to those from the Bertrand mill, Nevada. Prior to the introduction of Krom's rolls in this mill they were used in works only erected for the concentration of ores by Krom's dry system. Sufficient evidence, however, has accumulated to prove the superiority of the rolls beyond any doubt. Their introduction at the Mount Cory mill, Nevada, will soon bring additional proof. It seems to me that the application of rolls is most favorable in such cases in which the silver is extracted by lixiviation and the character of the ore permits comparatively coarse crushing without interfering with good roasting.

A Comparison Between Rolls and Stamps

Will be made from the following premises, for the correctness of which I must ask the indulgence of the reader. I assume that the crushing capacity of two sets of Krom's 26-inch rolls is equal to that of a 30 stamp battery with stamps of 850 pounds dropping from 7 inches to 8 inches 94 times per minute. Mr. Clark, superintendent of the Bertrand mill, states that he can crush, with two sets of rolls, 100 tons of ore in 24 hours to such a fineness that all will pass through a No. 16 screen, consuming not over four cords of wood for power. The ore has a quartz gangue and is by no means an easy crushing ore. The fuel required for running 30 stamps would be about six cords of wood in 24 hours, taking into consideration the construction of engine and boilers, and quality of wood. For some remote locality in the West the following prices are assumed, namely: Freight at three cents per pound; lumber at \$50 per thousand feet; wood at \$6 per cord; wages of carpenters at \$4.50 per diem, and of millwrights at \$6. Certain items of construction will be about equal, namely: Conveyors, elevators, revolving screens, and dust chambers. Revolving screens are also used in connection with a well-appointed battery in order to separate coarse material resulting from a breaking of battery screens. The building, however, for rolls will be much smaller than that for the battery, and a saving of not less than \$1,500 will be effected in its construction. Finally, the rolls requiring less power, a saving of at least \$1,250 will be made in providing and setting up engine and boilers in a mill with rolls.

Cost of Erecting a 30-Stamp Battery.

The plant, including hard-wood screen frames and guides, wooden pulleys on cam-shafts, Tulloch's feeders, and all necessary bolts, weighs 90,600 pounds, and costs in Chicago \$5,840, according to a statement from Messrs. Fraser & Chalmers. The framework takes about 36,000 feet of lumber, and the expense of setting up the battery is estimated at \$4,000. Hence the total cost of constructing a 30 stamp battery is:

Plant at foundry.....	\$5,850
Freight.....	2,718
Lumber.....	1,800
Cost of setting up.....	4,000
Total.....	\$14,368

To this has to be added, in order to compare with rolls:

Extra cost of building.....	\$1,500
Extra cost of engine and boilers.....	1,250
Total.....	\$17,118

Cost of Erecting Two Sets of Krom's 26-Inch Rolls.

The amount of lumber required for setting up the rolls alone is merely nominal. From this it follows also that the labor of placing the rolls must be trifling. The weight of one set of 26-inch rolls is 12,000 pounds, and the cost in New York, \$2,250. There is one self-feeder required, and its weight is estimated at 2,000 pounds; cost at \$200. From these figures I deduce the following:

Plant at foundry.....	\$4,700
Freight.....	750
Cost of setting up.....	700
Total.....	\$6,150

Difference in favor of rolls, \$10,938.

Wear and Tear of Stamps and Rolls.

In comparing the wear and tear of stamps and rolls we cannot very well express this item per ton of ore crushed, because the capacity of the pulverizing machinery is a function of the hardness of the ore and of the fineness of the pulp produced. A more correct method will be to take figures per running time of 24 hours. Making estimates from this standpoint, it is supposed that the wear and tear in running the machinery at full capacity is a nearly constant quantity, while the capacity is variable, as stated above. The wear of rolls is principally confined to the steel tires; that of the battery to a great number of parts. With rolls the steel tires can be consumed to within less than one-half inch of their thickness, while with stamps the shoes and dies have to be exchanged after only two-thirds, or less, of their weight has been worn, leaving other parts out of consideration. Another point should not be overlooked. The complicated construction of the battery causes considerable expense in skilled labor for repairs, which in the case of rolls is merely nominal. Advocates of the battery have argued that its great advantage is the continuance of its operation if one battery of five stamps gets out of order, while both sets of rolls, or three sets, as the case may be, have to be stopped if repairs are needed for one set. But it is just the solid construction of Krom's rolls which reduces stoppages from this cause to a minimum. How often it is necessary to hang up stamps for repairs is too well known to require any statistical proof.

Wear and Tear of Krom's Rolls.

As to statistics of wear of Krom's rolls, I am confined at present to those from the Bertrand mill. Mr. R. D. Clark states that two sets of steel tires have been worn out in crushing, in round figures, 20,000 tons of ore. As stated previously, the full capacity of the rolls is in 24 hours 100 tons, the ore being sifted through a No. 16 screen. In the beginning, however, the ore was crushed much finer, namely, so as to pass a No. 20 screen, and the daily capacity of the rolls was much less. Taking this into consideration, the actual wearing capacity of the tires cannot be estimated at less than 250 working days. The cost of wear is as follows: Two sets of steel tires cost at New York \$764, their weight being 3,264 pounds. With freight at three cents, the total cost of these steel tires is \$862.

Wear and tear of steel tires in 24 hours.....	\$3 45
Wear of other parts, screens, lubricants, and supplies.....	1 75
Wages for repairs.....	2 25
Total.....	\$8 45

Wear and Tear of Stamps.

I have been favored with statistics from three of the most prominent mills in the West, namely, the Manhattan, Nevada; the Ontario, Utah; and the Lexington, Montana. Taking into consideration the somewhat abnormal conditions of the Manhattan mill in so far as the weight of stamps there is 1,000 pounds, and the number of drops per minute greater than in either of the other mills, and that the statistics from the Lexington are those from the first year's run, where certain breakages are reduced to a minimum; finally, that freight in these localities, on account of direct railroad communications, is less than I have assumed in my premises, I arrive, by making such allowances, at the following figures for wear and tear of a 30-stamp battery per 24 hours running time:

Cost of all parts subjected to wear and breakage, screens, supplies, and lubricants.....	\$11 50
Wages for repairs.....	5 50
Total.....	\$17 00

Wear and tear of rolls.....	6 45
Difference in favor of rolls.....	\$10 55

Interest and Amortization.

In comparing the expense of running rolls and stamps interest and amortization on the excess of capital required in the original construction of the plant for stamps cannot be neglected. Considering the short life of most silver mines in this country, this item cannot be taken at a lower rate than 15 per cent per annum. If we take the running time of a mill at 350 days in the year, and consider that the mill with stamps will cost \$10,938 more than one with rolls, the interest and amortization amount to \$4.68 per day.

(Concluded next week.)

AN OAKLAND INDUSTRY.—The following editorial comment on an Oakland industry, owned by the Downie Boiler Incrustation Preventive Company, appeared a few days in the New York Sun: "It is stated that the recently patented process for the manufacture of a gum of the eucalyptus globulus, which has the effect of thoroughly removing the scales which form on steam engine boilers and preventing rust and pitting, has created a largely increased demand for it, both in this country and in Europe. The effect of this preparation in thus preventing the pitting and corrosion of boilers will, it is expected, extend the period of their usefulness 100 or 150 per cent, and at the same time insure a very considerable saving in fuel, as scale is a non-conductor of heat. The distillation of essential oils from the leaves of this tree is another branch of industry." The factory of the company is located at East Oakland, and is now turning out 1,500 gallons of their extract of eucalyptus every day.—Oakland Tribune.

PRESIDENT CLEVELAND will go to the woods of Northern New York for a six weeks' vacation early in August.

El Dorado County Notes.

[From our Traveling Representative.]

El Dorado county is Democratic now. Georgetown is not as lively as it used to be. The water supply is not so large this season as last.

Grizzly Flat mines are doing some considerable work.

Mining about Placerville is not causing much excitement.

Work on mines about Spanish Flat is progressing slowly.

A small force of men are at work on the French claim at Greenwood.

There is talk of starting up the old Taylor mine; also the St. Lawrence, near Johnstown.

Mining about Georgia's Slide is quite active, and in a number of instances is paying handsomely.

The California Water Company are working a number of mines on different parts of the Georgetown divide.

D. Blair, at Green Valley, is opening up a good property. He has a stamp mill on the ground and is doing finely.

A. J. Morrell has put a force of men on the Morrell extension of the celebrated Cedarburg mine on the American canyon, near Greenwood.

Bucknam Brothers, of Spanish Dry Diggings, have bought the Cherokee Flat mine and are working a night and day shift in the drifts. This mine has been very rich in days gone by.

The Slager, one of the richest quartz mines on the middle fork, near Spanish Dry Diggings, is lying idle. Capital and push could have opened up a bonanza in the Slager, as few ledges made the showing this one did for the work done on it.

The small number of men engaged in mining in this county this season is accounted for from the fact that last year nearly all the Democratic voters were mining; this year they are nearly all in office; hence the few Republicans are doing the work this year.

A New York company are working the Gopher and Boulder near Kelsey. They have a 20-stamp water-power mill and are running night and day. The mine was not in shape to be seen by a mining newspaper correspondent at the time of the Press representative's visit.

F. R. J. Dixon is still working the Revenge, mine, near Greenwood. This mine has paid steadily for more than a year past and has given the district a name for stability that will result in opening up more good properties. The mines on the middle fork of the American are idle, with few exceptions.

Vice-President J. P. Hopkins, of the Aultman mine, formerly the Argonaut, near Greenwood, is East making arrangements to properly open up that excellent property. The mine was purchased from Smith brothers a few years ago for \$50,000. Few mines have the showing in the way of a great ore body that this mine has. While the ore is of a low grade, yet it is in such immense quantities as to prove even more desirable than "pocket" or gash veins of high grade ore in chimneys or chutes. There is an abundance of sulphurets in the quartz, so much so that concentration would pay handsomely. It is seldom in the history of a mine with the showing made by this one that so little work has been done by the purchasers. This is accounted for on account of the death of one of the principal owners, and as soon as his estate is settled up in all probability the mine will either be sold or worked. A mine with less than one-half the showing in New Mexico or Arizona would be developed at once and as extensively as men and money could push it, and as long as it continued to make such a business-like showing as the Argonaut does at its stunts do today.

An inspection of the Lovejoy mine, near Pilot Hill, leads an ardent mining man to believe that "familiarity breeds contempt." The owners of this mine, T. T. Lovejoy and Major John Smith, have owned rich mines (Smith sold the Argonaut not long ago for \$50,000), or they would not let the Lovejoy lie idle after the output of nearly \$600 in less than 30 feet of development. The mine was discovered on the dividing ridge between the middle and south forks of the American river. It is a quartz ledge running nearly with the dividing ridge, only that it crosses through the hill and crops out upon the slope of both sides. The hill system below this ridge on both sides has been very rich, and of the same character of gold as that taken out of this mine. This vein is undoubtedly the source of the supply. The ground on which the discovery was made was patented years ago as agricultural land, and in consequence has not been get-at-able by the prospector. Waste water from a ditch uncovered the ledge, and the discovery of the mine was owing to Lovejoy's having a week's time on his hands that could not be put in at ranch work. Not being a mining man, he gophered on the surface for pasture, and the result was a good mine. The owners have been offered several thousand for the mine. It is a shame that such a prospect should stand idle while money and time is being foolishly spent every day on claims that are actually good for nothing. Major John Smith, of Greenwood, has the management of the mine, and as a recent runaway has seriously injured him he will probably dispose of it to some one who will open it up as it deserves to be developed. F. W. S.

The Vacaville Judicium says that the negroes recently brought from Kentucky have given entire satisfaction. More will be sent, for by the ranchers.

USEFUL INFORMATION.

The Four Largest Incomes.

If the value of a man's property is to be estimated by his annual income, Mr. Mackey, of the California Bonanza firm, is by far the richest man in the world. His income exceeds that of Vanderbilt in the proportion of 25 to 18. The following are the estimated incomes of the four men who are reputed to be the richest in the world:

	Duke of Westminster.	Vanderbilt.
Capital.....	\$80,000,000	175,000,000
Per year.....	4,000,000	7,500,000
Per month.....	300,000	676,000
Per day.....	10,000	15,000
Per minute.....	7	18
	Rothschilds.	Mackey.
Capital.....	\$200,000,000	275,000,000
Per year.....	10,000,000	13,750,000
Per month.....	850,000	1,000,000
Per day.....	25,000	35,000
Per hour.....	1,000	1,500
Per minute.....	20	25

NATURAL SOAP.—The discovery of mineral substances which answer quite well for many of the purposes to which soap is applied are becoming quite common—so much so that the discovery of a "soap mine" is not now considered quite so much of a myth as formerly. The latest discovery of this character is described as follows: "There is said to be a vast deposit of natural soap near Corning, Ohio. As the story runs, a party of hunters in the 'Big Woods' built a fire against a precipice of rocks for the purpose of preparing a meal. The heat split off a large fragment of solid stone and to their surprise a slippery substance of a dirty yellowish color began to run from little perforations on the face of the rock. This substance had a consistency similar to that of molasses in cold weather. After gathering a quantity of the stuff the discoverers managed to stop the outflow. Samples are said to have been sent to leading chemists throughout the country, who, with one accord, pronounce it nearly a pure article of soap. Scientists suggest that this deposit is owing to a combination of lakes of potash and rivers of essential oils within the subterranean caverns underlying the great coal measures of Southern Ohio. The story sounds like one of Munchausen's tales, yet it is said that a company with a capital of \$200,000 is being formed to work this natural soap mine."

PYROTECHNICS.—Not many people of those who have witnessed during pyrotechnic displays the hursting of those wonderful bombs which send out showers of gold and parti-colored stars have any idea how they are made and fired. The principle is the same as the military shell, the case being made of paper instead of heavy metal. Two hollow hemispheres are charged with innumerable conical-shaped stars made from compressed coloring matter, and when the halves are joined together and paper sealed they are thrown from a mortar. Unless the stars are very carefully arranged they are apt to detonate by the force of the powder exploded in the mortar. The distance to be traveled by a shell before the stars shall break is regulated with a fuse running 4, 5, 10, 15 or 20 seconds. This fuse, which is a necessary adjunct to all fancy fireworks, is a simple contrivance. It is made by soaking ordinary cotton wick in a compound of meal powder, gum arabic, alcohol and water, and is very combustible. At the moment the shell leaves the mortar the fuse ignites and is gradually consumed until the flame reaches an interior cavity of the shell holding a charge of powder. Instant explosion ensues, the shell breaks with a loud report and sheds the hursting stars in a perfect shower of beautiful colors.

THE GREAT EASTERN AND NOAH'S ARK.—Somebody is comparing the size and cost of the Great Eastern and Noah's Ark. The cost of building and launching the Great Eastern was \$3,650,000, and this broke the original company. A new company was formed, which spent \$600,000 in fitting and furnishing her. Then this company failed and a new company was organized with a capital of \$500,000. At the close of 1880 this company sunk £26,715 upon the vessel, thus making her total cost \$4,703,575. Nothing ever built can stand comparison with the Great Eastern except Noah's Ark, and even this vessel could not match her. The length of the Ark was 300 cubits, her breadth 50 cubits, and her height 30 cubits. The cubit of the Scriptures, according to Bishop Wilkins, was 21 65-100 inches, and computed into English measurement the Ark was 547 feet long, 91 feet beam, 54 7-10 feet depth and 21,762 tons. The Great Eastern is 680 feet long, 83 feet beam, 56 feet depth and 23,093 tons measurement. So Noah's Ark is quite overshadowed by the Great Eastern.

ENGLISH ELM.—For English carriages elm is largely used. It is found in the hedge-rows of most of the counties and many of the avenues of the parks of the United Kingdom. It also occupies a wide range over Europe, preferring, generally, low lying ground with a moderate degree of moisture, but it thrives well in every variety of soil. In English elm the wood is brown in color, of moderate weight, hard, tough, porous, and sometimes much twisted in grain, which makes it difficult to work. Elm, if used either where constantly wet, or in any situation where it is perfectly dry, excels almost any other wood in durability, but otherwise it decays rapidly. For elm is felled it

should be converted as soon as possible, for if exposed to the weather it becomes doated and much inferior in quality to its natural state. The elm principally used in carriage building is known as the common elm, and is a fairly reliable timber, having very little heart, cup or star-shake, and when grown in a rich, soft ground, it is very suitable for boot-sides, toe-boards, rockers, etc., but it is not good for bottoms, through constant damp rotting it, the bottoms of boots being very apt to decay, also through want of ventilation. The sap of elm is from two inches to three inches thick, and is considered as durable as the heart, so that all parts can be used with safety.

CHINESE BANDOLINE.—Pau-fa or the "Chinese shavings," which the ladies now use so much in dressing their hair is composed of real shavings taken from a species of elm, something similar to our "slippery elm," fragments of which, soaked in warm water one night, produce a vegetable mucilage or bandoline as useful for dressing, curling, and crimping the hair of the Chinese beauty as is the quince seed oil to-day here.

VISITING CARDS.—The significance of the different ways in which visiting cards are turned up is given as follows: "Turning the upper right corner of a card implies a visit; turning the upper left corner, congratulations; turning the lower left corner, condolence; turning the entire left end, a call on the family."

BICYCLES.—The manufacture of racing bicycles involves very nice manipulation, and hitherto English mechanics have stood unrivalled in this branch. Some machines of this kind, however, recently produced at Chicopee, Massachusetts, are said to rival anything of the kind made over here.

A NEW INDUSTRY has sprung up in Uruapan, Mexico. The famous coffee of that region is now put up in bottles, in the form of an extract, which is shipped to all parts of Mexico, and an effort is being made to introduce it into the United States.

VARNISHES AND PAINTS.—All varnishes crack from the surface and all paints crack from the underside. The presence of ammonia in the atmosphere is the greatest enemy to varnish, as it weakens the cohesion between the oil and the gum.

MILES OF PIPE.—It is estimated that not less than sixteen miles of tubes were taken out of the U. S. steamer *Florida*, which was lately broken up at the New York Navy Yard.

TO REMOVE VARNISH without injuring paint, brush on spirits of ammonia or hartshorn, which soon softens the oil, allowing of its being rubbed off easily.

GOOD HEALTH.

The "Work" in Going Upstairs.

Many persons complain of the fatigue of mounting long flights of steps and feel that they are failing before their time. There need be no anxiety on this score. Going upstairs is simply performing so much work in a given time. Mr. G. Farmer, who has investigated this subject, says: "Just for curiosity I sent my assistant, who weighed 152 pounds, to climb the stairs at the Forty-second street station, to note the time in seconds which was required to climb them leisurely. He counted the stairs, 36, and it took him 34 seconds to climb them. The rise of each step was 8 inches; total rise, 8 x 36 = 288 inches = 24 feet. Now, his weight, 152 pounds, multiplied by the total rise, 288 inches = 43,776 inch pounds = 3,648 foot-pounds of work done in 34 seconds. Now 1 horsepower does 550 foot-pounds in one second, and in 34 seconds will do 34 x 550 = 18,750 foot-pounds; now divide 3,648 by 18,750, and we get 195, almost one-fifth of a horse-power, which this young man exerted while he was climbing these stairs leisurely. He said he usually went up two steps at a time when in haste. Now let us compare this work with that done ordinarily while walking on level ground. His average step when walking rapidly would be not far from 26 inches, and the distance from the ground to the thigh-joint would be not far from 33 inches; thus at every step he lifts his center of gravity 2 1/2 inches—all, or nearly all, his weight above the knees will be raised 2 1/2 inches at every step. Assume that 130 pounds would be lifted 2 1/2 inches at every step, this would equal 341 inch-pounds per step. Now, divide 43,776 by 341, and we get 128.4 steps, which, multiplied by 26 inches, gives us 3,338.4 inches = 278.15 feet as the distance he would have to travel in 34 seconds to do work equivalent to climbing those stairs.

287.2 x 3,600
34 x 5.280
This is = 5.58 miles per hour, which I think is an under-estimate. How few invalids—ay, how few tired persons could maintain this pace even for half a minute without great fatigue!"—*Exchange*.

POISONED BY FLIES.—A bald-headed man in Louisville was recently much annoyed by large numbers of the common house-fly that settled on his head and prevented his taking any rest or comfort in life. The number increased to a swarm, and he was compelled to seek the shel-

ter of his room. As he left the porch where he had been seated, several of the insects settled on his forehead, and before they could be knocked off had bitten him in several places. In a few hours the places began to swell and became inflamed, until one of his eyes was closed. He suffered much pain from the bites, and continued to grow worse, until it was feared that his blood had become poisoned from some matter possibly contributed to his system through the medium of the proboscis of the insects. What should induce them to so persistently follow him is unknown. Some apprehensions are felt as to the ultimate recovery of the gentleman, who is about 70 years old.

WHOOPING COUGH.—Dr. C. R. Hingsworth writes in *The Lancet*: "I have found a popular remedy very efficacious in the treatment of whooping cough. I refer to picked oakum, worn by the patient either round the neck in muslin or on the chest as a pad stitched to the underclothing. Locally I apply the glycerine of tannic acid with a laryngeal brush two or three times a day, and internally I prescribe one, two or three grain doses of chloral, one, two or three minims of belladonna, one grain of alum and one minim of carbolic acid, in syrup every two or three hours. A liniment of turpentine, acetic acid and yolk of egg is an excellent application for the chest, back and neck, night and morning, with the liniment of belladonna added in the proportion of 1 to 7. In children of two years or more, I have applied carbolic acid and glycerine, in the proportion of 1 to 15, to the larynx with success, each application checking a paroxysm at once. With the above mentioned treatment I cure the worst cases in from 7 to 10 days."

CURE FOR BILIOUSNESS.—The way to get the better of the bilious system without blue pills or quinine is to take the juice of one, two or three lemons, as appetite craves, in as much water as makes it pleasant to drink without sugar before going to bed. In the morning, on rising, at least half an hour before breakfast, take the juice of one lemon in a goblet of water. This will clear the system of humor and bile with efficiency, without any of the weakening effects of calomel. People should not irritate the stomach by eating lemons clear; the powerful acid of the juice, which is always most corrosive, invariably produces inflammation after a while, but properly diluted, so that it does not burn or draw the throat, it does its medical work without harm, and, when the stomach is clear of food, has abundant opportunity to work over the system thoroughly.—*Medical News*.

CAUSE OF BRIGHT'S DISEASE.—The latest theory concerning Bright's disease and other affections of the kidneys is that they are due to immoderate use of ice water and other chilled beverages. Thirty or forty years ago, a physician asserts, when people slaked their thirst with fresh water from well or pump, kidney disease was virtually known. Now, however, the general use of ice in every household and saloon and the multiplication of soda fountains, cause thousands of persons to abruptly shock their heated internal organs with freezing draughts, and kidney troubles have become very prevalent.

DISINFECTANTS.—It is often asked what is the best disinfectant for a cesspool? Two pounds of copperas, or sulphate of iron, dissolved in a pail of water, will greatly assist in purifying a privy or cesspool. A pound of nitrate of lead dissolved in the same way is excellent for sinks, drains or vaults. Chloride of lime is also effectual, or a layer of charcoal dust will prevent offensive odors arising from any decomposing substance. The quantity of these substances will depend upon the amount of filth to be deodorized, and the length of time during which they will be effectual will depend upon local conditions.

HEALTH, like success in life, says the *Herald of Health*, is to be gained by paying attention to details. It is better to try to keep from catching cold than to be always trying to avoid infection. More can be done to check cholera by keeping houses clean than by using disinfectants. Nature gives health. It is man's perversity in departing from Nature's teachings that leads to disease. Nature intended all to have fresh air, sufficient plain food, uncontaminated water, and exercise. Let us accept Nature's bequest if we prefer health to disease.

SUNSTROKE.—In cases of heat or sunstroke lay the person in a cool, shady place. Loosen his clothing. Let the bystanders rub the arms and legs with pieces of ice wrapped in towels until the excessive heat of surface is allayed. Give twenty drops of aromatic spirits of hartshorn in a little water every twenty minutes or half hour. No effort to rise or walk should be allowed till the patient is quite restored. Hartshorn is said to be better than brandy in cases of sunstroke.

A WARNING TO DRINKERS.—*Le Journal d'Hygiene* publishes a comparative table of the probabilities of life for moderate drinkers and total abstainers. According to this, a moderate drinker at twenty years of age may expect to live 15.6 years; at thirty, 13; at forty, 11.6; at fifty, 10.8; at 60, 8.9. The probabilities for total abstainers are: At twenty years, 44.2; at thirty, 36.5; at forty, 28.8; at fifty, 21.23, and at sixty, 15.285.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ABOUT SUTTER CREEK.—*Ledger*, July 25: The Mahoney mine has shut down for want of water. The superintendent will try and induce the company to erect steam power, so as to keep the pumps going independent of water supply. Whether this will be done remains to be seen, but the prevailing belief is that the mine is practically abandoned, so far as the present owners are concerned. Drifting in the Eureka is making rapid progress. Four hundred feet having been reached, without any noticeable change. The formation is slate, considered a good indication. The Lincoln mill started up a few days ago, with the prospect of a long run, as there is considerable ore on the dump.

GENERAL.—J. A. Steinberger and F. B. Latham have made a thorough examination of the Amador Con. mine and it is thought that drifting will be continued.

OTHER LOCALITIES.—At the Wadley mine five miles above Volcano, shaft now down 160 feet proceeds with good prospects. The ledge, three feet wide, shows at the rate of \$47 per ton. It is a remarkable feature of this mine, that the ore frequently shows native silver and free gold close together, and visible to the naked eye. A tunnel is to be run into the St. Julian mine to tap the ore body below the point in the shaft where operations were suspended on account of water. Bids were received last Monday for running 160 feet of this tunnel, the first 100 feet will be merely an open cut. At the Kittredge, two and a half miles west of Jackson, three men are employed in prospecting. The face of the tunnel shows a ledge from four to five feet wide, the ore to all appearance being of good quality. There is a two-stamp mill on the ground, but it cannot be started on account of lack of water. The Oneida Mining Company, are negotiating for the mining claim lately discovered near Pine Grove. There is a large and rich ledge in sight, justifying the sanguine expectations indulged in of a big mine being developed. At the Lighthouse mine near Butte City, owned by W. E. Stewart, operations were resumed last Monday. Four men are at work running a tunnel at a point much lower down the gulch. This tunnel will be 400 feet long.

Butte.

HYDRAULIC MINING ON BUTTE CREEK.—*Record*, July 25: John Adams brought to Chico \$3,000 taken from his hydraulic claim at Centerville, 12 miles from town. This has been done without damage to the farmers below. Mr. Lusk agent of Senator Stanford, and Mr. Goodspeed, agent of Judge Pratt, large landholders along the creek, visited the Hupp and other mines, and found nothing to call for an injunction to stop the work of mining. The gold has been taken out in a legitimate and proper manner. We are glad to chronicle the success of the mines on Butte creek, and hope they may send down a like amount weekly until the rainy season closes them out.

Calaveras.

ANGEL'S CAMP.—*Al. Echo*, July 22: Quite a large amount of machinery has already been received by the Angels Mining Co. This company evidently means business. The Stanislaus River Mining Co. has commenced bar mining at Reynolds' Ferry with a force of 18 men. A substantial dam is being put in, which will shortly be completed.

Inyo.

KRAMER CAMP.—*Independent*, July 25: Reports from this locality, in San Bernardino county, are less favorable. Kramer is 40 miles from Mojave, in the midst of the desert, and four miles from the railroad. The water used is brought on the railroad. But four or five persons are now at the camp. The ledges are large and straight, with nearly east and west course, slightly north dip, but almost perpendicular. The prospects run, by the horn spoon process, from \$10 to \$50 to the ton. These figures, however, are the extremes. Buyers of ore charge \$5 per ton for sampling, \$14 for working, \$18 for shipping and then discount the product \$8 per ton. So you see there is worse than nothing left for the poor miner, and Kramer, with its 25 ledges and probably 50 or more valuable mines, must lie idle and 1,000 men out of employment until her rich ores can be milled at a profit.

PINE MOUNTAIN.—A pack train is now at work getting out ore from Pine Mountain to be shipped to Nisby & Co., San Francisco. A large amount of ore is in sight in several claims. The Pine Mountain district would be a first rate field for the concentrating process introduced at the Maxim mill; there are great quantities of ore that are just too low grade to bear the cost of packing, but that would pay well to concentrate. The country is favorable for mining operations, and has an abundance of wood and water.

MODOCK MINE.—Superintendent writes July 14th: I start the furnace on the 25th inst. Ore on hand, 228,000 pounds. Would start to-morrow if I had enough of men to run. Am working six men (in South Lookout) on ore. Average car samples 83 ozs. silver, \$17.21 gold per ton. Total number of miners employed, eight.

REPORTED STRIKE.—*Register*, July 22d: It is reported that A. L. Cain and David Norrie have found and located the cement gold deposit discovered some 20 years ago, but never prospected, as the Indians were hostile and shot the locators. Since then scores of miners have hunted for it, but it has been left for Al. Cain to capture the prize, if it is the veritable deposit, of which there is little doubt. Mr. Cain was put on the track of it through information obtained from an Indian, and he was accompanied by Mr. Norrie, who possesses a mineral divining rod, which located the richest spot, some 90 feet square. At a depth of 15 feet they struck the rich cement, specimens of which show nearly half gold, and will assay about \$60,000 to the ton. Two locations have been made, the Cain and Found at Last, and duly recorded in the County Recorder's office. This find is in Mono county, about two miles from the old Mammoth mill in the Mammoth district, and if it is only half as good as represented it is the biggest thing out of doors.

THE DARK HORSE.—Across the river is a gold bearing ledge and situated pretty well up on the mountain, in the vicinity of the Plute mine, and some five miles distant from the railroad. A great deal of prospecting work has been done at intervals along the ledge for a distance of 2,700 feet; a fair, uniform prospect of free gold is obtainable in every shaft and tunnel, and generally throughout all the ore. The ledge is a monster in size; at 82 feet in depth, and all the way down, the ore body measures 16 feet wide. It is asserted that not a hornful of it but will yield a fair color. Tunnels have been run at this depth from 30 to 50 feet, ore nor conditions showing no material change. If any of it will pay, all of it will. It can be mined for a mere trifle, as a single shot in a stope will loosen tons of it. It prospects well all the time, but its working value, mill process, has never been tried. The location is such that the ore has to be packed, else expensive wagon roads built, three or four miles long. By means of a three mile ditch a sufficiency of water for milling and contingent purposes can be brought quite near the mine.

Mariposa.

THE DILTZ MINE.—*Gazette*, July 25: This mine has lately been timbered up and the car tunnel put in shape. There is a great body of milling ore now in sight, and it will take years to find out its extent; besides there are plenty of sulphurets which assay away up.

NEW ENTERPRISE.—M. Hulings, owner of extensive mining property at Hornitos, is going to run a narrow gauge railroad from there to the Merced river, six miles distant. A large mill to be run by water is to be erected on the river and other improvements carried out that will require a large outlay of capital. The cost of milling the rock at the new works will be very small and ores of all grades at Hornitos will pay. The enterprise will surely be put through this season.

Mono.

BENTON ITEMS.—*Correspondent Bodie Paper*: Half a dozen ledges or more are being opened with good prospects in this vicinity. On the eastern side of the hill, on the Borasca, some 12 men are steadily employed, taking out ore and prospecting for new developments. The mine is well ventilated by means of a furnace at the mouth of the tunnel, with air pipes running to the working parts. The furnace draws out the foul air through the pipes, leaving the fresh air to flow in through the tunnel.

Passing along by the Alabama, we cross over to Alex. McKeever's, who is opening up the Black Bess ledge by a new tunnel. Higher up, Mike Harrington is working the Comet ledge with good prospects. One or two tons of ore worked at Miller's mill some time ago, milled over \$800 per ton. Tom Walker is working part of the mine on lease and is taking out good ore. Further south, near the old Peterson mine, Herman Konrad has opened up two or three ledges this last year, and has taken good ore out of each. Since the mill closed down, times appear rather quiet in town.

Nevada.

LOOKING FOR MINES.—*Transcript*, July 25: Several more mining men have arrived here in search of good quartz mining property. There are about a dozen or fifteen experts here examining several properties hereabouts. It is said that several sales have been made and will be made public in a few days. Nevada county quartz mines are now attracting more attention than ever before. For meritorious mines this section is unequalled.

THE DERREC drift mine is looking splendid, and some good sized nuggets are being found almost daily. The rumor that it was soon to be closed down was unfounded. Some men who were employed in the tunnel were discharged, which gave cause for the rumor. The upper part of the mine, where most of the work is being done, never looked better than now.

THE CROWN POINT MINE, situated at the head of Hill's Flat, half a mile from Grass Valley, is one of the most promising properties in that district. It is owned by A. Gauthier. The shaft is down 880 feet and shows a ledge from 2½ to 3 feet thick. The ore averages \$12 a ton. It has been crushed in a custom mill at a cost of \$50 a ton, including the hauling, thus leaving a liberal balance to cover the cost of mining and declare dividends from. The hoisting and pumping machinery is run by an overshot wheel, 34 feet in diameter. A ten stamp mill has just been erected, and will start next Monday. The overshot wheel will give sufficient power for all the machinery on the mine.

WILL BEAR WATCHING.—The old hydraulic mining spies in the upper part of this county have been superseded by a new crowd. The people up there should renew their watchfulness and keep their homes and barns securely bolted day and night. If the meeting about to be held up there should adopt resolutions giving some of these worthless notice to leave, it would not be surprising.

NEW VENTURE.—*Grass Valley Union*, July 24: The King's Hill and Phoenix locations have been consolidated, and work is now to be entered upon, the machinery of the Imperial mine on Deer Creek now being used upon it. The new company has been incorporated with a capital stock of \$250,000 and \$50,000 shares, 41,200 of which have been taken.

Plumas.

THE ALTOONA.—*Greenview Bulletin*, July 22: During the past two weeks, the Kettle mill has been running on ore from this mine. After crushing 208 tons, a "clean up" was made, proving that the Altoona produces good paying ore. Work on the vein continues. Another run will be made as soon as a sufficient quantity of ore can be extracted.

Placer.

THE BIG OAK TREE MINE.—*Herald* July 25: Near Colfax a parallel ledge to the Rising Sun is beginning to attract considerable attention. The main shaft is down more than 100 feet, steam hoisting and pumping works have been put up, and the prospects heretofore, as well as the ore now coming to the surface, all indicate a good mine. The May Flower mine at Forest Hill is keeping up its lick. On the 18th 28½ pounds of gold were cleaned up from the riffles that escaped from the battery during the week. The week ending July 11th no less than 42½ pounds were cleaned up from the same source. Last Tuesday Superintendent Chappell shipped to San Francisco 41 pounds of bullion, the product of the batteries for two weeks. The yield of the

mine in June was \$52,000. Later—\$10,000 is reported as having been taken out in one night this week. An encouraging development has been made in the Succor Flat drift mine near Iowa Hill. There is talk of the Belmont mine near Ophir being started up again soon. The same of the Julian mine at Jenny Lind Flat.

Sierra.

THE BEST YET.—*Tribune*, July 25: The extension clean up last week was 203 ounces. This is the largest yield for any one week's work yet done in the South Fork ground.

WILL ENLARGE THE MILL.—The Alaska mine, at Pike City, is in full blast and paying well. It is the intention of the Company to add twenty more stamps this summer to the twenty already in operation at the mill. They have already commenced grading for that purpose.

WHAT IS NEEDED.—A vast amount of prospecting is being done all over Sierra county, by people who live and have their homes here. We have no fault to find with the work that the present population is doing. As a whole they are most nobly carrying on the brave work of developing the inexhaustible resources of the county. But, on the other hand, the welfare of our county does demand that capital seeking investment in mines should not be allowed to pass us by and go to other fields possessing not one-half the merit of this, the banner county of the State.

MISCELLANEOUS.—Work on the Marguerite mine will start up about the first of August; the property is looking fine. The quartz mining industry about Downieville is improving every day. It is now on a solid basis, and investments in that line are regarded as safe as in any other class of business. Dr. Holdsworth was down from Milton this week. He had some specimens of rock which were covered with coarse gold. One of the pieces, he said, came from a ledge fifteen feet wide. The old gentleman says the country up that way is actually alive with rich gold-bearing quartz lodes, and he can't understand why it is that people who have means to invest in mining enterprises don't come up there and investigate so promising a field.

ALL SOLD.—The 100,000 shares of stock, reserved as a working capital by the Young American Mining Co. have been sold to the last share. The principal portion was disposed of in San Francisco at forty and fifty cents per share—the latter price having been obtained for most of it. The buyers of the stock will probably find before many weeks roll around that they have made a lucky deal, as the shares of that mine are quite likely to double up in value at a lively rate as soon as the mill gets to crushing the rich ore lying around up there. This will yet prove one of the big mines of the State.

San Bernardino.

STILL ACTIVE.—*Calico Print*, July 26: It is a fact that there are more mines being worked to-day in Calico and more chlorides at work on leases than there ever was before and yet there are men foolish enough to make the assertion that the bottom is knocked out. Last Wednesday Milo Page, his brother Thurlow, and the latter's wife and children, and Frank Suiter, left for the gold mines in Butte valley, where these gentlemen will resume operations on the mines opened up there. Their prospects are good, and it is hoped before many months a lively camp will be started up there. Reports continue favorable from all parts of the mines especially so from the Providence district where the Bonanza King Company are doing remarkably well. The new mill of the Calico mining and reduction company is running successfully, \$10,000 having been produced since it started on the 6th inst. The product of all the mines in the district for the month ending on the 20th inst., is estimated at \$113,000 in silver bullion.

Shasta.

LOOKING FOR MINES.—*Democrat*, July 22: For the past ten days Redding has been full of mining men looking for investments in the county. Among others is Mr. Minear, an old Comstock miner.

THE SCHEARER MINE on Salt creek continues to hold out as depth is attained. The vein is better defined than ever, and still yields rich tellurium. Mr. Schearer has returned from Denver. He tells us that the ore he took with him is pronounced to be the richest ever treated at the Argo smelting works. The first grade yields nearly \$35,000 and the second grade a little over \$4,000. The best yields 78½ ounces of silver. Mr. A. P. Waugh has made a location across the river opposite, but a little east of his ferry, which is thought to be an extension of the Schearer tellurium mine.

OTHER MINES.—A San Francisco company has bonded the Northern Light mine, and is to commence work prospecting it soon. This mine has always had the reputation of being good property. Last week the new Winthrop company, while exploring the mine, struck a large body of the richest ore ever found in Copper City, considerable of which assays way up in the hundreds.

UGHT TO GET THE MONEY.—Mr. Loveridge, superintendent of the Oregon gulch hydraulic mine near Junction City, Trinity county, passed through Redding yesterday morning, on his way to San Francisco, to try and negotiate a loan on the property to raise money with which to build 20 miles of ditch to bring water on to the mine. This is said to be the best property of the kind in the northern part of the State. It embodies nearly 500 acres of gravel on the divide between Weaver Basin and Junction City. It pays from the grass roots down to bed-rock, and much of the gravel bank is 200 feet in depth. For the past three years, on account of the scarcity of water, the company has only been able to get the property well opened for extensive work. Surveys for the proposed ditch have been made, and all necessary data as to cost, etc., has been obtained. It is estimated that the ditch when completed will furnish an average supply nine months in the year of 2,500 inches, and will cost \$160,000.

AT LOWER SODA SPRINGS Hersburger, Carpenter & Co. have sunk 52 feet on their quartz ledge, and commenced tunneling to tap 250 deep. They are in 25 feet and expect to have the tunnel completed in about four months. Their ledge is a true fissure, and promises to pay.

Siskiyou.

CALLAHAN'S.—*Yreka Union*, July 23: The town is supported mainly by the mining and agricultural industries, but derives revenue from other sources,

The country surrounding will admit of much prospecting for mineral wealth, more so, perhaps, than any other portion of the country, for the reason that the footsteps of the prospector have not been directed this way of late years. The developed mines have paid well, and will continue to do so for many years to come. The Montezuma, a mine which has yielded several fortunes in its time, closed for the season several weeks ago, and the clean-up, as usual, was entirely satisfactory. Most mining operations in this vicinity are over for the season, which has been a short one. Along the Klamath nearly all the hydraulic miners are still running, having plenty of water and taking out big money.

Trinity.

NEW RIVER.—*Journal*, July 25: A party recently from New River expresses the utmost confidence in their richness and extent, and is firm in the belief that intelligent prospecting and practical work will develop a number of good mines in the district. After the boom it was only to be expected that everything there would be dull, but the bed-rock having been reached a reaction will soon set in and New River gradually work its way upon its merits.

NUGGETS FROM COFFEE CREEK.—Rumfelt & Co. who are drifting on the east fork of Coffee Creek, are taking out much coarse gold, and recently secured a piece which weighed \$280. It was round and smooth, about the size of a fore-finger and shaped like a rolling-pin. They expect to find plenty more large pieces.

QUARTZ MINES.—The McDonald mine at Deadwood is yielding right along regularly from \$80 to \$140 per ton. Every ten days they clean up from \$10,000 to \$12,000.

BULLYCHOOP.—The Potts & Foster wagon road has been completed to the Eureka mill site; this has gone to San Francisco to purchase a Huntington quartz mill; Stevens & Smith are erecting a hotel at Bullychoop; and the district is generally prosperous.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, July 27: The deep winze below the 3,000 level is down about 40 feet, and still in good ore. The hoisting machinery in the chamber at the head of the winze works very effectively, and, consequently, good progress is made in sinking. Water does not interfere, as the ore vein seems to exist in a comparatively dry section of the great ore channel. Water has been tapped to the east and the west of it, but not in the ore vein itself. Thus it is that the lateral drift north, being run from crosscut No. 2, makes steady and safe advancement, and will doubtless run through to the Savage mine without any trouble from water. It is skirting along the east side of the ore vein, and is an important drift. As before remarked, the simultaneous sinking of the Hale and Norcross deep winze, with its eastern dip, and the Combination shaft, vertical, brings them nearer and nearer together as depth is attained, and the all hopeful bonanza is corralled, so to speak, between the two, within circumscribed limits, unless it lies to the west of the winze, instead of to the east, as indicated at present. A car-track is to be constructed to run the ore from the Combination shaft around and across the ravine to the main track of the Virginia and Truckee railroad, near the Julia hoisting works, where a dump is to be constructed to receive it, for convenience in loading the regular ore cars of the railroad.

CON. CALIFORNIA AND VIRGINIA. The low stage of water in the Carson river having seriously interfered with milling facilities, the quantity of ore extracted from both the Jones contract section and the lower levels on company account is very much reduced, and quite a number of miners are drafted out of employment. The average assay of the ore shipped from the lower levels during the past week was \$20 per ton, and that from the Jones lease section \$16 per ton.

BELCHER.—The mining force being much reduced, the amount of ore extracted from the old upper workings is correspondingly reduced. Some very good old bonanza ore is reported to be developed in the lower depths above the water level—about the 1,700 and below. The Gold Hill mines may have to be pumped out yet.

SIERRA NEVADA.—The face of the main lateral drift north on the 520 level continues in vein porphyry, clay and quartz, the general appearance of the material being considered to be of a very favorable nature, indicating approaching proximity to possible ore developments in an interesting quarter.

CHOLLAR.—All the work on the 3,000 or lowest level continues suspended, pending the putting in of the additional hydraulic pump at the Combination shaft. Work is also suspended in the extraction of ore from the old surface workings of the mine by reason of the lack of milling facilities.

ALTA.—The upraise from the 900 level has passed above the 800 level, following the footwall of the ore vein. No ore is met with at present worth saving, but the explorations are being continued in the hope of eventually finding a paying ore body, of which there is good promise.

KENTUCK.—Extracting a reduced amount of low-grade ore from the old upper workings, sufficient to keep the Rock Point mill, on the Carson river, running to about half its full capacity.

BULLION.—The main drift west on the 160 level is now in 145 feet and the face is in porphyry, quartz and clay. Water interferes but little, and the main ore vein is evidently not far away.

MEXICAN.—The joint Ophir and Mexican crosscut east on the 500 level is progressing well, and the upraise from that level in the Ophir mine is making about 25 feet per week.

BEST AND BELCHER.—Crosscut No. 1, west, about 100 feet north of the old Consolidated Virginia line, made about 50 feet last week, and is running in very favorable formation.

GOULD AND CURRY.—Crosscut No. 1, east, at the north line of the Savage mine, on the 1,000 level, is now in or out about 330 feet, with no features of interest to note.

MONTE CRISTO.—No work is being done in the mine at present. A contract has been let to sink a shaft 200 feet further east.

JUSTICE.—The drift southeast to intercept the

vein formation in that portion of the mine is making good progress.

UNION CONSOLIDATED.—The main drift north on the 500 level is progressing well in favorable working ground.

Columbus District.

MOUNT DIAHLO.—*True Future*, July 25: In accordance with an order received from the San Francisco office of the company to clean up all ore at the mill by July 31st, and close the mine at that date, the force has been reduced, and the men remaining, who are now putting the mine in shape—cleaning out the chutes, etc., will be discharged as soon as possible and the mine closed down. A bullion shipment of \$14,347.73 was made July 16th.

Osoeola District.

GOOD GOLD ORE.—*Hard Reflex*, July 27: Eleven tons of gold bearing quartz were lately put through the five-stamp mill from Boone Tilford's claim that went \$94 to the ton, also five tons from the same claim that went \$35 to the ton. Work has been commenced on Capt. Akie's ore. Pat Keavy will also have some ore worked.

Paradise District.

WORK PROGRESSING.—*Silver State*, July 25: Superintendent McMurtry, of Paradise Valley, is in town. He says the mines are looking well and the water at the mills holds out. Last week the rock-crusher was broken, but he had the quartz broken by hand and run through the Cornish rolls, until a new casting for the rock-breaker arrived from San Francisco. He is now having a shaft sunk below No. 4 tunnel, the lowest depth yet attained in the mine, and the vein in the shaft is from ten to twelve feet wide, and the quality of the ore is steadily improving.

COAL DISCOVERY.—A coal mine has been discovered in the mountains on the east side of Reese River Valley, about twenty miles south of Lewis. The discoverers have been quietly prospecting the vein, and at a depth of thirty feet have found a seam of good coal. They are now perfecting their title to the vein in Lander county, and they hope to be able to supply all the towns along the Central Pacific with coal of good quality next winter, as they will build a road from the Nevada Central railway to the mine.

ARIZONA.

RUNNING AGAIN.—*Ref and Bullion*, July 25: The Columbia Copper Smelter, sold two years ago at Sheriff's sale, is again in operation. The property is situated 30 miles southeast of Tucson and is now running on ore from the Warren mine. It has run four and a half days on this ore and turned out 12 tons of copper matte that will go 60 per cent copper, worth about \$1200. The Mexican teamsters employed to haul the ore refused to work any more at the price paid—\$5 per ton. It is good news that arrangements have been made to run this smelter regularly, as it is capable of employing, directly and indirectly, from 60 to 120 men, who would all trade in Tucson. The superintendent desires it to be known that he is now in the market to purchase copper ore at favorable terms.

BETTER TIMES FOR LOMBSTONE.—A few days ago steam was let into the engines of the new Grand Central pumps and everything worked to a charm. Yesterday the Contention pumps were also moved for the first time in fourteen months, and showed their operators their rest had not impaired their ability. This is encouraging news, for when these huge machines are both in use the dull times will disappear and the bustle and push which once characterized our city become the rule again. The courage the companies named now display will prove contagious, and one after another the bonanzas will become tenanted, the machinery active, our men busy and the hills resound to the echo of the pick and blast.

WALNUT CREEK PLACERS.—*Prescott Miner*, July 25: There are at present about 50 men engaged in working the Walnut Creek placer mines, with an average yield of about two dollars and a half per day to the man. On account of scarcity of water work will soon have to be stopped on several claims until flumes have been constructed for a larger and steadier supply of water, when a good showing will come from these gold beds.

COLORADO.

LAKE COUNTY.—*Tribune Republican*, July 25: Tim Ryan is working three jigs, concentrating the waste dump at the Brookland shaft of the Adams Company. Cleary is working the Comique lode on the northern slope of Fryer Hill. He is drifting on a promising body of iron. A fifteen-horse-power hoister is to be placed on the Best Friend mine at the head of Big Evans Gulch—one of the oldest properties in the country. It is a true fissure, and in the past has yielded a great deal of rich ore. Work will be resumed on the Leo shaft at Oro City next week. The shaft, when work was suspended, had attained a depth of 412 feet. At 350 feet from the surface a drift was driven to the westward for quite a distance, in anticipation of catching the vein in its eastward course, but without success. The shaft is sunk in the hopes of opening up a productive contact. The Chrysler Mining Company is giving employment to about 120 men, distributed about the mine, concentrating and amalgamating mills. The mine is producing 25 tons of smelting or first-class ore per week, and considerable milling and concentrating ore. The amalgamating mill of the company is now treating about 45 tons of ore a day, secured from the company's property, which averages 11 ounces in silver to the ton.

THE ADAMS COMPANY'S MINES.—In the southern portion of the Brookland mine, where the bulk of the product shipped during the past six months has been obtained, there are to be seen some of the largest and most wonderful ore faces to be found anywhere in Colorado. A continuous breast of ore is disclosed here of several hundred feet, and possessing a height or thickness of two to twenty feet. The more recent developments, extending to the northward from the Brookland shaft for about 140 feet, almost without exception show fine ore, including for quite a distance a four-foot breast of mineral highly impregnated with chloride of silver. The heading of the principal north drift is still in good ore, and 250 feet ahead of this drift and slightly to the westward the Maid of Erin mine, an adjoining

property, discloses vast bodies, leaving little or no doubt that the Brookland ore body will be extending equally far to the northward, and assuring a supply for ore that cannot be extracted in the next three years. The entire property of the Adams Company embraces over nine acres, out of which between two and three acres have been proved up, and seventeenth of one acre has been worked out. The productive ground opened up embraces a square area of 400x250 feet, through which the ore is estimated to average four feet in thickness, giving a total of 400,000 cubic feet of ore, or allowing nine cubic feet to the ton, 44,444 tons. Between one-third and one-half of this ground has been stope out, and yielded in round numbers 20,000 gross tons of ore, leaving at present a reserve in sight of 24,444 tons. The ore being very desirable for smelting, it is treated at a nominal price, and, being over the average in lead with a fair contents in silver, it nets about \$25 per ton above smelting charges. Up to date the company has paid in dividends \$217,500, and this amount will be increased to \$300,000 before the close of the year.

EAGLE COUNTY.—The Horn Silver is turning out some El Dorado mineral, and is now showing its best. As exploitation is pushed on the Combined Discovery and Uncle Sam, the vein improves in a highly satisfactory manner. Next to the Iron Mask comes the Black Iron on the shipping list. Some number one carbonate mineral is being forwarded from here at this time. The Iron Mask takes the lead on the shipping list of the carbonate mines. Ten cars of heavy lead mineral have been forwarded from here in the past week. To-day this is the best showing lead producer in the camp. If operations are conducted with good judgment and economy, more ore will be turned out from this property the present season than from any mine on Battle Mountain. New properties are stepping to the front daily. Last week a third interest of the Percy Chester was sold for \$5,000. A wire team is being put up and will be in operation by Monday next, no accident preventing. The Ben Butler is being worked, and shows finely. The same can be said of the Copper King and Pine Martin. Ten days ago the Rocky Point was sold for a handsome figure, and it is to be started up the coming week. A strong seam of bonanza mineral is here exposed. Some fine rich pay is also showing in the Wonder. Last on the list is the First Chance above the Last Chance fissure. All the above are in the quartzite, and each has pay mineral in good quantity. At Holy Cross it can be said the mining season has at last opened. The snow is about all gone. Some twenty men are at work here. The Knapp mill will start up to-day or Monday. From all appearances there are better indications of something of moment being accomplished at this camp at this time than ever before.

OURAY COUNTY.—Joe Funk is running a cross-cut on the Eureka, with fine prospects of striking it rich. Weston & Corson are working three men on the Blackbird taking out ore. They have considerable sacked ready for shipment. The Yellow Jacket is being worked by Mr. Ellis under a bond. Messrs. Hite and Brodie are developing some property on this creek. A 100-foot contract is being worked on the Belle of Ouray, under the direction of A. Humphrey. W. H. Fourrell is working his Bear Creek property. Riche and Hook have the Victory under lease and bond, and are drifting to gain depth. They will work the property for the purpose of production. Smith and Kimball have one shift engaged on the Poughkeepsie. Prospectors and claim owners are flocking to the gulch, prepared to do their assessment work. The snow is all gone, except on the high ridges, and things are beginning to assume a business aspect. A large amount of ore will be marketed, in small lots, from now on. A great many miners have been saving the best of the ore that they have taken out in development, and will sell it, to place them on their feet for another year's work. Sprinkle and Hammen are industriously pounding away on the Spar, and are making their labor tell. Their pay streak is now about 8 inches wide, and runs up to a satisfactory notch. The tunnel running above the vein, a winze was sunk about 6 feet and drifting resumed. R. D. Price has shipped a quantity of ore from his Paquin property and awaits returns. The Bonanza at the Lake, near the head of Poughkeepsie gulch, is showing up well under the management of C. N. Chase. The Dallas Placer Company have engaged the services of an old hydraulic miner from California, and turned the water in their pipes again. The trails are drying up fast and the corduroys that were placed along the moist places are now discarded.

IDAHO.

SHUT DOWN.—*Wood River Times*, July 25: The Wood River Mining Company has suspended operations, discharged all their hands, and will wind up present affairs with a view to resuming at a future time on a new and more favorable basis. The mines have produced well, but expenses have been too heavy, and require to be reduced, which can only be done successfully by closing out and making a new start.

SMOKE ORE TO COME IN.—The miners and prospectors in Smoky Ore are busy making branch roads to connect with the new wagon road. There is ore sacked up at the Galore, Tyrannis, King of the West and other mines, which will be brought in as soon as the roads shall be completed. The first shipment will be in Bailey in about one week.

A RICH STRIKE has been made on the 600 level of the Vienna mine, as a consequence the mill of the company, long idle owing to litigation, will now be started up.

WILL PUT UP A WISWELL MILL.—J. H. Pennington has purchased an undivided one-third interest in the High and Chief mine, in Lava district. The mine is a very valuable one, crops out for over 400 feet, and 4½ feet in width. Assays prove it to carry four ounces free gold per ton, worth \$82. Mr. Pennington has sent men to develop the property, and will make arrangements to put up a mill at once—probably one of the Wiswell Electric Pulverizers and Amalgamators, of which we hear good accounts wherever they have been used.

A PAYING MINE.—To-day the Queen of the Hills paid off its second dividend, aggregating \$12,500, and making \$25,000 paid in dividends during the past few months, notwithstanding the serious inconvenience and shutting down caused by the miners' strike last winter. The total output of the Queen of the Hills to date is \$190,000. The company is out

of debt, owns a plant which cost \$50,000, and a mine estimated to have \$1,000,000 worth of ore in sight, or about to be shown up.

MONTANA.

HELENA DISTRICT.—*Independent*, July 24: The shaft on the Helena mine is down 117 feet. The tunnel which is being run from the working shaft to the main perpendicular shaft only lacks a few feet of completion. When this is finished, so that good air can be had, sinking will be resumed. The ore is good and there is plenty of it. The Christmas Gift shaft is down 76 feet and shows plenty of fine ore—carbonate and galena. This mine is in the center of a group of leads owned by Mr. Sperling, who has concentrated most of his work upon it. The other veins show up well for the amount of work performed and will eventually prove to be good ore producers. Men are now at work sinking a new shaft south of the old one, with good results. Work is progressing on other mines in the vicinity, and the camp is assuming a more business-like and prosperous air. Ten Mile, as generally understood, embraces a section of country about 50 miles square, in which are hundred, of lodes, the largest group being on Red Mountain, a large, cone-shaped peak, standing out boldly and alone, like a giant among the smaller mountains that surround it. A quartz mill of 10 stamps is to be put up near the top of the Main Range, west of Red Mountain, and the road will connect with the Ten Mile road near Rimini. A fine group of free gold bearing leads surround the spot selected for the mill, and considerable work is now being done.

BLACKFOOT VALLEY.—*New Northwest*, July 24: Is surrounded by mountains rich in gold and silver and gulches that in the past have been classed with the richest in the Territory—Lincoln and McClellan. Next comes Stonewall and Keep Cool, Liverpool and Sour Kraut. All these have been rich in places and are not half worked out. All have abundance of water, and with modern appliances can be made to pay well. The Cameron Bros. are putting in a flume in Stonewall gulch. Other parties are mining at the head of the gulch. James Hansen is piping off some bars in Poor Man creek, between McClellan and the main range, with good results. Old Lincoln, for the work done, has paid well for drifting, and a claim that has been worked with a pipe has yielded well. The quartz from the Giant lode, in Stonewall, owned by Cameron Bros., will speak for itself with mortar and pan; also rock from the Comet lode, in Poor Man district, owned by Win. Chnran. It assays high in silver and gold; it is on the Lincoln stage road. There are timber and water on the claim in abundance for working purposes. It will compare favorably with the best quartz in Butte. There is a mountain of it, with over 20 locations, but very little development. Next comes Ivan Hook district, at the head of Big Humboldt, rich in silver bearing rock, but little development, owned by Johnson, Lund and others, all in Deer Lodge county, and in the near future will be better known to the county assessor and treasurer.

GENERAL MINING NOTES.—The Hecla, of Glendale, is shipping two carloads of base bullion every day. The foundation of the new Tosten, Missouri valley, smelter, is completed and work has commenced upon the stack. The Virginia Belle tunnel, in the Boulder district, Jefferson county, has encountered a large body of high grade galena ore. Longmaid has purchased the old Penobscot property, near Marysville, for \$4,000. It was only a few years ago when this property was sold for \$500,000. He has put men to work fixing it up in shape to begin development and the extraction of ore. The erection of a mill is also contemplated. The new smelter at Tosten started up on the 8th inst. The 664-foot tunnel on the Oro Cache lode at Maiden, is about completed. A connection with the drift from the winze is hourly expected. Three days work last week by Henry Edgar and Harry Ammie in their placer ground in Welcome gulch, Missoula county, resulted in a cleanup of \$48.35. There are about 40 men in that gulch. Three companies are working with money results, and it is thought sluicing can be prosecuted until as late as November. The Little Rocky country was blessed with too much June rain this year and nearly all the sluice boxes in camp, together with what little gold had accumulated therein, were washed away. N. Thompson, et al., have a quartz location across the river from Townsend with an immense body of ore in sight, some of it assaying as high as \$125 to the ton. Blocks of quartz four feet square have been taken out, assaying over \$50 per ton. There are now less than 100 men in the Little Rockies. Of nine miners who returned to Maiden last week, all agreed that there is little gold to be taken out. But for the recent rains that washed out most of the sluice boxes, fair wages might have been secured; as it was about 75 cents per day to the man was the average. The miners are all leaving.

NEW MEXICO.

CERRILLOS DISTRICT.—*Santa Fe Leader*, July 20: This district contains several hundred prospects ranging in depth from ten to two hundred and twenty-five feet; many of them can be called mines, and have proved themselves to be valuable. The whole district has been prospected, and ore shows up everywhere. Without doubt the district holds within her well defined leads enough wealth to pay off the national debt. Concentrating works, smelters and stamp mills will soon show up the district to better advantage than we see it to-day. Cerrillos has a bright future.

THE GREAT AMERICAN has large quantities of ore ready for working, and \$100,000 worth more mined and lying on the dumps waiting till some company will take hold and put up works for treating it.

THE SILVER CITY Concentrating and Smelting Works.—G. A. Shufeldt has taken charge of these works which were put up about one year ago, but from one cause or another have never been started. Mr. Shufeldt has put in three Frue Vanning machines, which with two Rapids already in the mill, give it a concentrating capacity of 10 tons per day. Mill has 10 stamps, a crusher, Cornish Rolls, and is prepared to do a public sampling business in addition to concentration. Control assays will be made for parties desiring to ship their own ores, and thus protection will be furnished the shipper. He will know before his ore leaves the depot just what he ought to get out of it. The starting of this sam-

pler and ore buyer, with the approaching completion of the Flagler Reduction Works, are the best things that ever happened to Silver City and Grant county. Between them these two works can handle all the ore that the surrounding country can produce, and that means something very big. Mr. Shufeldt will either buy or sample ores in quantities from a burro load upwards. This is the chance that our prospectors, leasers and mine owners have so long waited for. There are many claims throughout Grant county that have abundance of \$40, \$30 and \$20 ore on them. It is estimated that if it does not cost more than \$7 to bring the ore into the works, that both the works and the mine owners can make money out of \$20 ore. Of course, the higher the ore runs above that the better it will pay.

OREGON.

FOUND AT LAST.—*Grant's Pass Times*, July 24: Some 30 odd years ago, an eccentric old man would bring into the mining camps along Rogue river from time to time, some very rich quartz which he would crush and extract considerable gold. Though frequently importuned, he would not disclose the whereabouts of his ledge and not much attention was paid to him. He was finally killed by the Indians, and the location of his lead has always been shrouded in mystery. During the famous Gold Hill quartz excitement, quite a number of persons hunted for the old man's ledge, but without success. Last Sunday, John Owens, while walking across a dry gulch just above the Hayes & Magruder placer claim, was suddenly precipitated into a hole, and on investigation it proved to be a narrow cut, the top of which had been covered with timbers and dirt, from appearances work had been done long years ago. Mr. Owens soon moved the debris, and followed the cut a distance of 30 feet when he came to a magnificent quartz ledge which had been cut in two; the lead is about five feet in width, the ore contains gold in considerable quantities which can be plainly seen with the naked eye. This is doubtless the murdered man's ledge, and it will prove a bonanza.

VARIOUS MINING ITEMS.—*Democratic Times*, July 24: Prospecting continues everywhere. About 50 men are at work on the quartz ledges in the Galice creek district. Placer and hydraulic mining is at an end for this season in Southern Oregon. Ex-Governor Chadwick has 100 tons of ore on the dump at the Yank ledge. Geo. W. Sturgeon of Pickett creek is putting a windmill in Rogue river. Success to him. The south tunnel on the Yank ledge has been completed by McNair & Co., and the northern will also be rushed to completion. There is considerable excitement in the vicinity of Woodville. Quite a number of promising quartz ledges are being prospected. Desselles & Connell, of Scotch gulch, Josephine county, have finished cleaning up and did very well. This is one of the very best claims in the State. Mark Colvig, of Rock Point precinct, has sent to the *Oregonian*, specimens of manganese and aluminum, both of which are valuable minerals, though how much so we are at this time unable to state. The parties who have undertaken to investigate the Yank ledge on Rogue river have been pushing matters energetically. A tunnel has been run into the ledge on both sides of the river and two shifts of eight men have been at work day and night for sometime. The ledge is 250 feet in width and the shafts are being run diagonally across it. The quality of the ore is considered satisfactory, and while there is no occasion for any excitement at present, there is a prospect that the Yank ledge may prove the great bonanza mine of Oregon and excel the Comstock in its best days.

PINE CREEK NOTES.—*Bedrock Democrat*, July 20: Wm. Harper will have his arastra in operation the coming week. The town of Cornucopia is being surveyed and lots are selling from \$50 to \$75 and upwards. W. O. Bitten, while passing the Allen & Co. mine the other day, picked up a piece of quartz and brought it into camp. He pounded it up in a mortar and realized \$5 from it. The Pine creek mines are the topic of conversation in every nook and corner of the Willamette valley and an exodus of people from that section may be looked for at once. Strangers are arriving daily in our city, securing mining outfits and going to the new mines. Three pounds of ore taken from the Forest Queen mine turned out \$50 in gold. The farmers of Pine valley and the miners working jointly will have a good wagon road completed from the valley to the mines in a few days. Every one that has been there predict they will turn out to be the new El Dorado. Persons contemplating visiting these mines should bear in mind the nearest route is via Baker City. Our merchants are offering every inducement to miners and prospectors wishing mining outfits. Stages leave this city daily for the mine. Persons arriving by train are not in any way delayed.

UTAH.

MINING MATTERS.—*Southern Utah Times*, July 25: North Star is booming. The outlook at the Rattler mine in the Carbonate Camp is not very bright just at present. Wages have been cut down at the Silver Horn mine, and when active operations are resumed, it will doubtless be upon a \$3 basis for underground work and \$2 50 on top. A regular Civil-Service retrenchment is going on in the ranks. On account of bad air, the underground men have been laid off. An air compressor should have been put in long ago.

SANDSTONE MINING NOTES.—The East Reef is situated about four miles southeast of the town. The crest of the Reef rises up to a height of from 75 to 100 feet above the surrounding country, and the cropings are distinctly marked running in a northerly and southerly direction for a distance of nearly three-quarters of a mile. The Vanderbilt mine has been attracting considerable attention here of late, on account of the rumors current of recent strikes of rich deposits of ore. The main working shaft is an incline sunk on the ledge to a depth of 160 feet. The ledge is four feet between the walls. The rich streak lies on the hanging, and varies in width from eight inches to two feet. A drift is run south, at the bottom of the shaft, for a distance of about twenty feet on the ore, at the end of which an uprise is being made and the ore stope out. There is a streak of fair grade ore on the foot wall, and the rich streak on the hanging wall assays between twenty and twenty-five ounces to the ton. This ore, while it would pay a company to save, is of no value to a person who must pay for having it worked.

TO CAPITALISTS.

FOR SALE—Half interest in 4,500 feet of valuable
SILVER MINING PROPERTY

In one of the best mineral locations in Arizona, having
wood and water on the ground. The mines are well de-
veloped, and thorough examination is solicited. Ore will
produce from fifty to nine hundred ounces per ton. The
interest will be sold at a sacrifice, as capital is required
to obtain machinery for hauling water. Address

SAN FRANCISCO, - - CALIFORNIA.

JOHN TAYLOR & CO., Assayers' Materials, MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG
GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Cruc-
ibles, Scoriaires, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we are
confident from our experience we can well suit the de-
mand for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes
will be sent free upon application. Agents for
Plumbago Crucible Co., London, England.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont Street, San Francisco.

Manufacturers of NEW and Dealers in SECOND-HAND

Boilers, Engines and Machinery of Every Description.

PORTABLE ENGINES AND BOILERS

On Skids.

Each engine is fitted with a governor, steam and water gauges, heater, fine brush, waste, blow-off cocks, brass whistle, smoke stack with spark arrester, oil cups, gauge cocks, combination check and stop valve, and pump.
Both boiler and engine are fitted in complete running order, and are sold either mounted on strong wheels with wide tires, or on skids.

STEAM PUMPS

OF ALL MAKES.

Mining Pumps.

Quartz and Sawmill Machinery.

AGENTS FOR THE SALE OF

"Cummer" Automatic Engines,
Porter Mfg Co.'s Engines and Boilers,
Blaisdell & Co.'s Machinists' Tools,
Hot Polished Shafting,
Baker Rotary Pressure Blowers.

CLERK GAS ENGINES.

RELIABLE,
ECONOMICAL,
SAFE,
STEADY,
COMPACT.

NO BOILER,
NO ENGINEER,
NO COAL,
NO ASHES,
NO DANGER.

These Engines are eminently serviceable for use as motors for Printing offices, Workshops, Laundries, Factories where sewing and bag machines are operated, and in Hotels, Public Institutions, and Private Buildings where pumps, elevators, or electric lighting machines are in use; and generally in Cities and Towns (where gas is obtainable) for all mechanical purposes requiring small driving powers.

Pacific Machinery Depot.

H. P. GREGORY & CO.,

Nos. 2 and 4 California Street,

San Francisco, Cal.

IMPORTERS AND DEALERS IN ALL CLASSES OF

MACHINERY

SOLE AGENTS FOR

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

A New Home Industry.

Manufacture of Materials from Graphite.

A short time since works were established in city by the Pacific Graphite Manufacturing Co., to make polish, axle grease, etc., from the graphite obtained from their mines in Sonora, Mexico. The mine has been known many years, but until the Sonora railroad was completed the product could not be brought to this city to advantage. The substance, as mined, runs from 80 to 95 per cent graphite, and is very pure and free from grit. The Ceylon mines, from which most of the plumbago previously brought to this country came, yield a graphite which is gritty and requires washing to free it from siliceous matter. That from the Sonora mine requires no washing at all. It is hauled from the mine to the railroad and thence transported to Guaymas, from which point it is brought to San Francisco by steamer. The deposit is immense and is easily mined.

The company now manufacture in this city stove polish, axle grease, skid grease, foundry facings and lubricants of all kinds. The stove polish they can sell in this market for \$1.50 to \$2 per gross less than the Eastern product. It is put up in handsome style, as is the axle grease. The latter is found very useful. There is a mineral oil mixed with very finely ground graphite. In using it there is no danger of hot axles, the lubrication being very perfectly accomplished. The skid grease, which is now used on the skid roads of saw-mills, has the advantage not only of cheapness over tallow, but will not melt and run off in the sun. It greases the skids perfectly and is lasting in its effects, not needing frequent renewal. The company intend shortly to commence the manufacture of plumbago crucibles here. With the articles made so far they are able to supply the home market, and hope to extend the trade in time.

The mineral is received at the factory in canvas sacks, containing 150 pounds each. The first process in making this very essential article of household use is to run the crude metal into a crusher, that in use in the new factory being capable of crushing ten tons of graphite a day. The lumps of mineral coming from the crusher are no larger than peas, and they are next dropped into an iron cylinder called a "tumbler," about six feet in diameter and three feet long. The "tumbler" is kept constantly in motion, and as fast as the particles of graphite are disintegrated they are blown by a revolving fan through an iron pipe about six inches in diameter and 50 feet in length into receiving bins in the basement of the factory. Plumbago to be used in lubricating oils must be ground very fine, and there is a separate bin in which it is deposited. Large wooden receptacles for the coarse grades of plumbago are ranged along the sides of the basement walls. On being taken from the bins the powdered mineral is conveyed to the hopper of a pressing machine, where it is first slightly moistened that there may be more perfect adhesion when pressed. A mold for 12 cakes of stove-polish runs back and forth under the hopper and the iron press, and the cakes after pressing are placed on an elevator and sent up so a drying-room in the third story, where they are deposited on smooth boards and left for two or three days, or until they have become perfectly dry. They are then wrapped and labeled by girls, the wrapping of twenty gross a day being no unusual task for a person skilled in this kind of work. The packages are next conveyed by means of a long chute to a room in which the boxing and shipping is done, and the polish is then ready for the market. The process of making pencils is similar as regards the crushing, blowing and pressing, but the molds are of a different pattern. A ton of stove-polish a day is the running capacity of the new factory, and the company is confident that it can place the manufactured article on the Pacific Coast market at prices that will cause the withdrawal of all Eastern manufacturers from the field. Owning and operating its own mines, it is also better able to compete with the factories of New York and Jersey city in their own territory. It is the intention of the company to make experiments in shipping crude material to the East, believing that it can be furnished cheaper from this coast than it can be procured elsewhere. The agents of the company are James O. Runtree & Sons, 16 Front street.

ADVICE to the aged: Use Muller's pearly spectacles, 135 Montgomery street, near Bush, opposite Occidental Hotel.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JULY 21, 1885.

- 322,671.—EXPANDING HORSE SHOE—C. C. Allen, Salinas, Cal.
- 322,693.—MANUFACTURE OF SUPERPHOSPHATE—F. Dikken, S. F.
- 322,716.—ORE FEEDER—J. Hendy S. F.
- 322,825.—GANG PLOW—J. Ingham, San Jose, Cal.
- 322,829.—ICE MACHINE—A. R. Kenney, S. F.
- 322,549.—HEATING DRUM—J. P. Lydon, Marysville, Cal.
- 322,643.—SOFA BED—Geo. W. Robbins, Los Angeles, Cal.
- 322,753.—CANDLESTICK—J. C. Schlarbaum, San Jose, Cal.
- 322,756.—DERRICK—David Sharp, Lemoore, Cal.
- 322,559.—BUILDING BLOCKS, ETC., MADE OF PURIFIED ASHES AND LIME—E. L. Ransome, Oakland, Cal.
- 322,763.—PNEUMATIC DOOR CHECK—Geo. Vincent, Stockton, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MIXING AND AGITATING APPARATUS FOR PLANT WASHES.—Edward J. Delaney, San Jose, No. 321,089. Dated June 30, 1885. It consists of a reservoir within which the liquid is placed, a pump connected with the lower part of said reservoir, so as to draw the liquid therefrom, a pipe extending from the discharge opening of the pump, and having its opening vertically above the top of the reservoir so that the liquid may be discharged through this opening into the reservoir to mix and agitate the contents. In connection with this are secondary discharge pipes or nozzles, to which the spray apparatus may be attached, so that a portion of the liquid is being discharged or sprayed at all times upon the plants or trees to which it is to be applied.

SOFA BED.—William R. Shaber, of San Francisco, Cal. Dated July 7, 1885. No. 321,540. This sofa bed belongs to that class in which a hinged seat and folding back unite with a central section to form the length of the bed. The peculiarity of this bed is its central section and the connection between it and the back, so that when the back is dropped the central section is raised to the level of the extended seat and back, and when the back is raised the central section is dropped below the level, forming a chamber or receptacle the whole length of the sofa, in which the bed-clothes are stored away. The construction of the sofa bed is such as to make an attractive appearance and to render it easy to handle.

HYDRAULIC DIRT CONVEYER.—Albert Boschke of San Pedro, Los Angeles Co., Cal. Dated July 7, 1885. No. 321,573. This device consists of a hopper or receiver for the material. Around the neck of this hopper, and communicating with it, is a pipe of larger diameter, which leaves an annular space between the neck and pipe. A casing communicates with this space, and water under pressure or forced by a pump is admitted to the casing, and passing through the annular space, in a hollow cylindrical or cone shape stream meets with and carries along the material discharged through the neck of the hopper, until water and material become intermingled and blended, so that the whole mass moves easily and can be discharged at any suitable distance.

AUTOMATIC GRADE-DELINEATOR.—Bernard Faymonville, of San Francisco, Cal. No. 321,591. Dated July 7, 1885. This invention is for determining and recording the variation in the surface of a country so that the work may be plotted or laid out upon a map after it has been completed. The result is effected by means of a wheeled vehicle and attached mechanism, the essential parts of which are a vibrating weight or pendulum, a marking point, a traveling paper moving in front of the marking point, and gearing between the weight and marking point. The weight changing its position with relation to the vehicle, by reason of the character of the surface over which the latter measures, records its variations on the paper. Thus, when the vehicle ascends a hill, the suspended weight remaining plumb has changed its position relative to the vehicle, and this change is recorded on the paper. So in descending a hill. Thus the amount and extent of the declivity can be easily plotted out when the field notes are worked out in the office.

DRAFT REGULATOR.—William Hunter, San Francisco. No. 321,502. July 7, 1885. The invention is especially useful in fire-places and grates, and its object is to control the draft and direct the heat into the room, or to prevent it from too rapid exhaustion. The regulator consists of two plates, both being slotted, and one lying behind the other and adapted to be moved so that the openings in the two plates will co-

incide more or less. These plates are set at an incline in the chimney just above the fire-place. Where the openings coincide perfectly a full draft is obtained. As the fuel is consumed the draft openings may be shut off partially, in order to throw the heat out into the room. And they may finally be nearly closed, when the combustion has reached a point at which there is but little smoke. The use of this device is also advantageous in creating a circulation of air in the room by reason of the hot air from the plates rising in the apartment, and as it cools, falling and seeking the grate again.

CAR-BRAKE.—Frank Landgrane, assignor of one-half to Milton E. Willis, S. F. No. 321,057. Dated July 7, 1885. This is a safety brake for street cars, and it consists of a supplemental mechanism attached to the brake-shoe, and having a foot-lever by which it may be operated so as to apply the brake to the car wheels in case the chain or regular connections get out of order. It is more applicable to cars drawn by one horse, which have a brake attached at one end only. When this breaks there is no way to apply a brake, so that on down grades accidents occur. This invention is designed to supply a means for applying the brake in case of such an accident, and which at other times will not be in use.

MOVABLE GATE FOR IRRIGATING.—John A. Fry, Ukiahfield, Kern Co. No. 321,593. Dated July 7, 1885. This irrigating gate is specially used for drawing out water from ditches or other inclosures, so that it may be transferred to other portions of the land to be irrigated. Where irrigating ditches are made to pass through arable land, it is necessary to draw water from various points and lead it to those parts which are to be irrigated. This is done by simply making an opening in the side of the ditch, and unless a wooden sluice is put in this it will often wash out to such a depth as will damage the ditch, and it is almost impossible to stop the opening when desired. Mr. Fry's invention is a portable irrigating device consisting of a plank or frame having an opening cut through it, a vertically sliding gate fitted to move across the opening, a flexible apron secured below the opening and extending outwardly therefrom, and a flexible apron also extending inwardly.

ICE MACHINE.—Augustus R. Kenney, San Francisco, Cal. No. 322,829. July 21, 1885. This ice machine is of that class in which the freezing is done in water compartments separated by refrigerator cans containing the brine or other freezing agent and the evaporator coil. The whole machine embodies many essential points of novelty which contribute to the result of making a very perfect and complete ice machine. Perhaps the most important feature is the wedge shape of the refrigerator cans. As ice freezes outwardly in right lines, the cakes are frozen in a slightly inclined position which give them a tendency, when loosened, to tip over, thus freezing themselves completely. The refrigerator cans are closed tight, and have reciprocating agitators in them, while similar agitators operate in the fresh water compartments. The machine has a nicely balanced gate which can be readily operated, and there are means for making it form a perfectly water tight joint when closed.

ROTARY ROASTING FURNACE.—Albert Arents, of Alameda, Alameda Co., Cal., July 7, 1885. No. 321,780. This furnace seeks to overcome a disadvantage which seems obvious enough when pointed out, viz., the unequal temperature to which an extended body of ore or other material is subjected, by reason of the fact that the intensity of the temperature of heated gases coming from a fire place and passing through any space of more or less extent diminishes gradually as the gases pass on, thus resulting in the greatest intensity near the fire place and the smallest near the flue or exit. Mr. Arents' furnace overcomes this difficulty by the employment of a rotating roasting chamber, the diameter of which gradually decreases from the end nearest the fire place to the end nearest the flue, or, in other words, the chamber is the frustum of a cone revolving horizontally around its own axis, its base being placed towards the fire place, and its top or end of smallest diameter being placed towards the flue. This construction results in increasing the depth of thickness of the body of ore nearest the fire place, and decreasing it nearest the flue, for the reason that the crushed ore or pulp seeks its level. The whole mass gradually increases in thickness from the fire place end of the chamber to the flue end. The flame and heated gases passing through the chamber from its widest towards its smallest end, find more pulp or ore to heat where it is hottest and correspondingly less where it is coolest, and thus securing a more simultaneous and equal heating, roasting and finishing of the charge.

Missing Papers.

We mail and send our papers to subscribers as carefully and regularly as possible, but changes occurring sometimes in our mailing hands, by illness or otherwise, or changes in the Postoffice here or at the place of delivery, may cause irregularity in the receipt of the paper by the subscriber. We therefore request that *always*, when subscribers fail to receive their paper in due time that they notify the office by postal card or letter, and we will, if possible, remail all missing numbers.

Mining Share Market.

To say of the mining share market during the past week that it has been "stale, flat and unprofitable," would be the proper thing, because Shakespeare having originated this expression it has been constantly employed by the stock reporter ever since; wherefore it has the sanction of high authority and much usage. Dealing in mining shares being one of those things which a great many openly condemn but secretly practice, it is always safe to condemn it roundly, which we have never failed to do, calling it by all kinds of hard names; and this, not because of any good it would do, but simply from a sense of duty, mixed sometimes with a slight desire to gain popularity.

The number of shares sold during the week footed up hardly more than 50,000, and as the most of them sold for less than two dollars, and some as low as five cents per share, the commissions realized on these transactions aggregated but a pitiful sum, scarcely as much as would in bonanza times have fallen to the share of a single broker. With the improvement reported in some of the Comstock mines the stock dealer is taking new courage, being hopeful that there will occur more lively times, and possibly a genuine old-fashioned boom before many months are over.

Bullion Shipments.

Manhattan, July 24, \$19,834; Comstock mines, July 27, \$31,500.

A New Premium for Readers.

The publishers of this paper have had printed on fine paper and handsomely bound, a neat little volume, entitled "A Beautiful Poetic Review and Friendly Offering." It was written by Dr. J. R. Bradway, orator of Oakland Council, American Legion of Honor, and read in short sections by the author at different meetings, and eliciting much praise from his listeners. The work is embellished with fine lithographic portraits of several noted poets whose writings are mentioned in the work. We believe the book will prove a pleasant and attractive keepsake in every family; it can be so readily taken up and read as leisure moments occur. It will be mailed for 25 cents to subscribers (old or new), upon paying 12 months in advance for this paper.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1. This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes *whereof* he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Elements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metals; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Anal; Assay; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulations, etc.; Lead; Assay of Lead; Volcanic Assays; "Barley" Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

These are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card costing one cent only will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. Look carefully at the label on your paper.

Gold Mines For Sale.

Two small gold mines for sale, in Kern county, California. Ore has paid by assays \$20 per ton. Worked to a depth of 60 feet. The vein is 15 inches wide. The mines are within seven miles of the Southern Pacific Railroad. The owner is not in a position to develop them without aid. The purchase price is very reasonable and there is a good opening for any one to take hold of the claims and work them. Address W. L., P. O. Box 2361, San Francisco.

W. E. CHAMBERLAIN, JR. T. A. ROBINSON.

Returned to new building, former location, 320 Post street, where students have all the advantages of elegant halls, new furniture, first-class facilities, and a full corps of experienced teachers.

LIFE SCHOLARSHIPS.....\$75.
Ladies admitted into all departments. Day and Evening Sessions during the entire year.

CRYSTAL SPRINGS RURAL HEALTH RETREAT, ST. HELENA, CAL.

This beautiful and popular Resort for Tourists and Invalids is situated on the side of Howell Mountain, 1,200 feet above tide level, 500 feet above and overlooking Napa Valley, and two and a half miles from St. Helena, in Napa County.

THE NATURAL ADVANTAGES

Of the Health Retreat surpass those of any other health resort. It is noted for its pure water, dry atmosphere, clear and balmy sunshine, even temperature, mild breezes, and the absence of high winds. Across the valley lies the Sonoma Mountain Range, breaking the sea breeze and shielding the Retreat from the chilling atmosphere of the coast, and presenting a safeguard against catarrh and lung diseases. The grandeur of its mountain ranges, with its shrubby canyons lying in beauty at their feet, the famous Mount St. Helena rearing its lofty head to the clouds, the gray plain lying beneath, reflecting the sunbeams like a grand mirror before the Retreat, all perfumed with a variety of wild flowers, lend an enchantment to this unsurpassed scene.

MALARIA IS A STRANGER AT THE RETREAT.

And in all this beautiful valley. In fact, the purity of the air on this hillside and in the upper valley, is a specific for malaria, and all diseases affecting the head, throat, and lungs; producing a healthy circulation through mucous passages generally.

COME TO THE RETREAT.

Most ailments can be cured by proper care and judicious treatment. All may be benefited. Are you a professional man, a Judge, Lawyer, Minister, or Doctor, suffering from mental exertion? Are you a business man, exhausted mentally and physically by too close application to business, and burdened with responsibility, troubled with constant thought of your ailments, dread of life or fear of death? Come to

CRYSTAL SPRINGS

And we will do you good. Remember that all these are but symptoms of disordered nerves, deranged stomach, liver, and other digestive organs that may be cured and leave you easy, and happy, and feeling younger for your stay with us. The treatment invigorates you, gives you a light heart, a quiet stomach, and a cheerful countenance. We employ no quick remedies, no patent nostrums. We treat all cases by the most recent knowledge of

HYGIENIC AND RATIONAL PRACTICE.

Disase is the injury of nature against the constant violation of her laws, and calls for hygienic regulation and wise observance of known physiologic law. Then all will be peace again. Especial attention is called to all persons suffering from

CHRONIC DISEASES.

It is a well known fact and recognized by all advanced pathologists of to-day that there is no specific for chronic ailments. They are only cured by hygienically removing the cause and giving nature time a proper conditions to heal itself. All surgical and mechanical assistance necessary in such cases is scientifically rendered. New facilities are constantly being added to make this the most advantageous, desirable, and efficient, as it is now the most natural and healthful

WINTER RESORT

In America; while a radical table is furnished for invalids and proper diet prescribed for each individual case, no one is confined to a starvation diet, and better and more ample variety is furnished at meals than is usual in any other probable cure, may do so before coming, by addressing RURAL HEALTH RETREAT.

The Managers have opened the Retreat under a new and experienced Director. They have secured the services of a thoroughly competent physician from New York; of nine years' experience in practice. Being a graduate from a three years' course of medicine and surgery in one of the New York Medical Colleges, it is his intention to keep abreast of the age in his profession. He is assisted by two lady attendants having a two years' course at one of the largest Hygienic and Surgical Sanitariums in the world, with five years' subsequent practice. Special inducements offered to all suffering with ailments peculiar to females. The Retreat is also open d as a

SUMMER RESORT

To all who desire to spend a few weeks or months in recreation and receive the benefit from rest and breathing the pure mountain air, whose easiness and purity is unsurpassed. For such a wholesome and liberal table is especially provided. While the Chief Object of this institution is to afford a Sanitarium for those in need of Hygienic and Surgical Treatment, ample means are afforded for recreation, and entertainment is provided for all boarders and pleasure seekers who love decency and good order. Winding and picturesque roads, walls of blasted rock terracing the hillside about the main building, cottages, and drive-ways, a fine campus, spacious woods, shady groves, arbored seats, swings, swinging rings, swinging chairs, rowing machines, machinery for developing the muscles and expanding the lungs, dumb-bell, and Indian club exercises are found here.

PLEASURE EXCURSIONS.

Are a factor of no small interest in coming to the Retreat. A Natural Cave, extending over 400 feet into the mountain, is within a few minutes' walk of the Retreat. A trip overland, twelve miles, through the pleasant and beautiful Napa Valley, of vines and flowers, to the Petrified Forest, can be made any day by a small party. Hotel accommodations or camp furnished. The summit of Round Tower Mountain, less than one-half mile from the Retreat, can be reached by a few minutes' walk, which, with its shady covering of Madroños, Live-oaks and Firs, furnishes an unlimited source of enjoyment and interest to the pleasure seeker and admirer of nature. Situated as we are, with the city and bay of San Francisco, with its Golden Gate and the old Pacific Ocean, but 60 miles south of us, and the famous Mount St. Helena towering high above all around, and looking down upon us from the north, this is just the place for

EASTERN TRAVELERS

To stop and regain their health, and at the same time view the curiosities and natural beauties of this portion of California, and escape the long, tedious, and sickly winter of the Eastern, Northern, and Middle States; for the winter season here is like the beautiful Spring time in the East. Geraniums, Verbenas, and Callas bloom all Winter in the open air.

LOOK AT IT

And think twice before you conclude to go to some other resort where they substitute for natural advantages "rare mineral water," but come and see for yourself where the water is pure as crystal.

EXPENSES.

Rooms, with board, Regular Treatment, \$15 to \$20 per week; without Treatment, from \$9 to \$15. Specially favorable terms for families and for the month. Some rooms in cottages can be furnished at reasonable rates. Office treatment and surgical operations extra.

TESTIMONIALS.

OAKLAND, CAL., February 22, 1884.

I have visited a number of the "Springs" and "Resorts" in California, and without hesitation can say that the "Health Retreat" is the most delightful of them all. The water is pure; the climate cannot be excelled; and the scenery is unequalled. Baths may be taken here under the direction of experienced practitioners and nurses—an advantage which I have found at no other place which I visited. At one place (Hot Springs) I found an intelligent superintendent who informed me that many invalids came to his place who, by the judicious use of baths, rendered their recovery almost impossible; but as they did not pretend to govern visitors in that respect, his advice would not be regarded if offered. At the "Health Retreat" it is not so. The feeblest may trust themselves with confidence in the hands of those who have charge of it. It is a quiet, pleasant, home-like place, where the sick are cared for and treated in harmony with nature's laws, and where the weary may find the most enjoyable rest.

ELD. J. H. WAGGONER,

Editor Signs of the Times, Oakland, Cal.

ST. HELENA, CAL., June 11, 1885.

Finding myself gradually failing, becoming emaciated, and with a bad cough, I was warned of consumption; I went to "Rural Health Retreat," weighing 130 pounds. Was happily surprised to find myself improving in one week. Now, at the time of writing, my cough is entirely gone; have free use of both my lungs; weigh 155 pounds, a gain of 25 pounds in four weeks. Words are feeble to express my regard for "Retreat," its physicians, and managers, who have the rare faculty of making you feel perfectly at home. I feel that the mercy of God attended their efforts, and to them I owe my speedy and remarkable restoration.

ELD. JOHN A. BURDEN, E. Portland, Oregon.

Persons sending notice previously will be met at the St. Helena depot by a carriage from Retreat. For further particulars and information, address

RANKIN, BRAYTON & CO.,
 BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street.
 Chicago: 100 N. Clinton.
 New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS,
 embracing machinery of LATEST DESIGN and
 MOST IMPROVED construction. We offer our en-
 tire experience in this SPECIAL LINE of work, and
 are PREPARED to furnish from SAN FRANCISCO
 or CHICAGO, the MOST APPROVED
 character of MINING and REDUCTION MA-
 CHINERY, adapted to all grades of ores and su-
 perior to that of any other make, at the LOWEST
 POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-
 LIVER in COMPLETE RUNNING ORDER,
 in any locality, MILLS, CONCENTRATION
 WORKS, WATER JACKET SMELTING
 FURNACES, HOISTING WORKS, PUMP-
 ING MACHINERY, ETC., of any DE-
 SIRE CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD
 ores of NEW and ORIGINAL DESIGNS, covered
 by LETTERS PATENT. No other Furnace CAN
 COMPARE with these for DURABILITY, and in
 CAPACITY for uninterrupted work. MORE
 THAN 150 of them are now RUNNING in various
 parts of THIS COUNTRY, as well as many in
 FOREIGN COUNTRIES, giving results NEVER
 BEFORE ATTAINED as regards CONTINUOUS
 running, ECONOMY of fuel, AMOUNT and QUAL-
 ITY of BULLION produced. These CLAIMS have
 been PROVEN by RESULTS in ANY NUM-
 BER of INSTANCES, and the GREAT SUPER-
 IORITY of this SYSTEM of smelting ores DE-
 MONSTRATED BEYOND QUESTION. COM-
 PLETE PLANTS furnished to order of any CA-
 PACITY, with ALL IMPROVEMENTS that ex-
 perience has DEMONSTRATED as VALUABLE
 in this class of work.

Beyond question the cheapest and
 most effective machine of the kind
 now in use adapted to all grades and
 classes of ores.

This machine has been THOROUGHLY TESTED
 for the past TWO YEARS, under a GREAT VA-
 RIETY of CONDITIONS, giving most EXTRA-
 ORDINARY results FAR IN ADVANCE of
 anything EVER BEFORE REALIZED. A re-
 cent COMPETITIVE TEST at the Carlisle Mine in
 Mexico, showed an ADVANTAGE OF OVER 30
 PER CENT in favor of THE DUNCAN. The
 amount SAVED OVER THE TRUE being suffi-
 cient to PAY THE ENTIRE COST of the ma-
 chines EVERY MONTH OF THE YEAR. One
 of its MOST VALUABLE features is as an AMAL-
 GAMATOR. It saves all the AMALGAM GOLD
 and SILVER that ESCAPES the BATTERIES,
 PANS or SETTLERS, making the machine worth
 MORE than ITS COST for THIS PURPOSE
 ALONE.

**Baker's Mining Horse Power.**

Possessing all the requirements of a first-class hoist,
 and affording means for the continuous operation of a
 Pump or Blower, without interfering with a hoisting ap-
 paratus. It is made entirely of iron, no piece weighs
 over 300 pounds. At the ordinary speed of a horse, a
 1,000-pound bucket of ore may be raised 120 feet per
 minute. The hoisting-drum is under the complete con-
 trol of the man of the shaft, and is capable of carrying
 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1876, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

**THE
"TRIUMPH" ORE CONCENTRATOR.**

**PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.**

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, taunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

Wrought-Iron Direct from the Ore.

The numerous direct processes which have been patented and brought before the iron masters of the world, differ materially from that now introduced by Mr. Wilson. He has succeeded in producing good blooms direct from the ore, and Mr. Willard P. Ward has, in a paper before the American Institute of Mining Engineers, pointed out theoretically the chief reasons of the success of his method. We condense from Mr. Ward's paper as follows:

In the Wilson process the conditions of the ordinary puddling operation are very closely approximated. Iron ore, reduced to a coarse sand, is mixed with the proper proportion of charcoal or coke dust, and the mixture fed into upright retorts placed in the chimney of the puddling-furnace. By exposure for twenty-four hours to the heat of the waste gases from the furnace, in the presence of solid carbon, a considerable portion of the oxygen of the ore is removed, but little or no metallic iron is formed. The ore is then drawn from the deoxidizer into the rear or second hearth of the puddling-furnace, situated below it, where it is exposed for twenty minutes to a much higher temperature than that of the deoxidizer. Here the presence of the solid carbon, mixed with the ore, prevents any oxidizing action, and the temperature of the mass is raised to a point at which the cinder begins to form.

Then the charge is carried forward by the workmen into the front hearth, in which the temperature of a puddling-furnace prevails. Here the cinder melts, and at the same time the solid carbon reacts on the oxygen remaining, combined with the ore, and forms metallic iron; but by this time the molten cinder is present to prevent undue oxidation of the metal formed, and solid carbon is still present in the mixture to play the same role, of reducing protoxide of iron from the cinder, as the carbon of the cast iron does in the ordinary puddling process. I have said that the cast-iron used as the material for puddling contains about three

per cent of carbon; but in this process sufficient carbon is added to effect the reduction of the ore to a metallic state, and leave enough in the mass to play the part of the carbon of the cast-iron when the metallic stage has been

reached, this sponge cooled down, in receptacles from which the air was excluded, to the temperature of the atmosphere, then charged into a puddling furnace and heated for working. In this way (and the same plan essentially has

"red-short." In the Siemens process pieces of ore of the size of beans or peas, mixed with lime or other fluxing material, form the charge, which is introduced into a rotating furnace, and when this charge has become heated to a

bright red heat small coal of uniform size is added in sufficient quantity to effect the reduction of the ore. The size of the pieces of the material employed prevents the intimate mixture of the particles of iron with the particles of carbon, and hence we would, on theoretical grounds, anticipate just what practice has proved, viz., that the reduction is incomplete, and the resulting metal being charged with oxides is red short. In practice, blooms made by this process have been so red short that they could not be hammered at all.

It would be impracticable in this process to employ ore and carbon in as fine particles as Wilson does, as a very large portion of the charge would be carried off by the draught, and a sticking of the material to the sides of the rotating furnace could scarcely be avoided. I do not imagine that a division of the materials into anything like the supposed size of molecules is necessary; we know that the graphitic carbon in the pig-iron employed in puddling is not so finely divided, but it is in much smaller particles than bean or pea size, and by approximating the size of the graphite particles in pig-iron, Wilson has succeeded in obtaining good results.

If we examine the utilization of the heat developed by the combustion of a given quantity of coal in this process, and compare it with the result of the combustion of an equivalent amount of fuel in a blast furnace, we shall soon see the theoretical economy of the process.

The coal is burned on the grate of the puddling-furnace to carbonic acid, and the flame is more fully utilized than in an ordinary puddling-furnace, for besides the ordinary hearth there is the rear hearth, where additional heat is taken up, and then the products of combustion are further utilized in heating the retorts in which the ore is partly reduced. After this the heat is still

Concluded on page 101.

WILSON'S FURNACE FOR MAKING WROUGHT IRON DIRECT FROM THE ORE.

reached. It is interesting to compare the Wilson with the numerous other direct processes, but there have been so many of them, and the data concerning them are so incomplete, that this is impossible. Two processes, however, the Blair and Siemens, have attracted sufficient attention and are sufficiently modern to deserve notice. In the Blair process a metallic iron sponge was made from the ore in a closed

been followed by other inventors) the metallic iron, in the finest possible state of subdivision, is subjected to the more or less oxidizing influences of the flame, without liquid slag to save it from oxidation, and with no carbon present to again reduce the iron oxides from the cinder after it is formed. The loss of metal is consequently very large, but oxides of iron being left in the metal the blooms are invariably

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Arizona.

Condition and Progress of Mining in Various Districts.

[Correspondence of MINING AND SCIENTIFIC PRESS.]

The writer returned a few days ago from an interesting trip of one hundred miles through a rich mineral region south of Prescott, and, although made in haste, a few items were gleaned. Almost immediately after leaving town, outcroppings of ore were noticeable on either side of the trail, which led over the Sierra Prieta mountains. In Groom Creek district, the first passed through, are a number of ledges carrying gold and silver, assaying \$50 to \$300 per ton, but little work is done on them. This region is well timbered with pines and oak, and well watered, as also is the Hassayampa district south of it. In this district is a greater number of mines that have been well prospected, and a few that have been worked to some extent. The ores are rich in both gold and silver, and assay all the way from \$20 to \$1,000. Rock producing \$100 to \$400 is common. This is also a rich placer mining district, and several hundred thousand dollars have been taken from the vast gravel beds along the Hassayampa creek. Like most of the small streams of this part of Arizona it furnishes an insufficient supply of water for mining during the summer months, and at present little is being done except to throw up piles of gravel to be washed when the water comes again. A great deal of the gravel is very rich, and in one mine we passed averages two and a half cents to the pan, or \$2.50 per cubic yard. Several miners make wages with rockers. Considering that these mines have been worked since 1863, it is surprising to note what slight impression has been made on the extensive gravel deposits.

Walnut Grove district, the next one south, which takes its name from a beautiful, green, tree-shaded vale locked in the close embrace of mountains and hills, contains many seams of rich gold quartz, but less has been done in developing this class of mines than in the other localities named. Several have been located which yield high assays, but nothing more than assessment work has been done on the major portion of them. The Montgomery group, consisting of the Lion, Tiger, Leopard and Badger mines, is near the upper end of Walnut Grove and about ten miles distant from Prescott. A tunnel 190 feet in length with side drifts has been run into this series of parallel ledges and a large amount of ore taken out. Assays have gone as high as \$300. One of the lodes is of low grade, \$25 to the ton, but its width is nearly 100 feet. A railroad now being constructed from the Atlantic and Pacific Railroad to Prescott, will, when continued southward to connect with the Southern Pacific, which is the intention, pass near these and other mines, when the advantages to be derived from cheaper transportation will permit of their being worked profitably.

At present they are difficult of access and only the ores of highest grade can be made to pay with the primitive methods necessarily employed. The gold ledges in this and adjacent districts usually contain free gold near the surface, but on sinking they run into sulphurets. Quartz from some of these ledges containing free gold is worked in arastras, but of course it is impossible to treat the sulphurets by the same crude process, and it is not probable that mills will be erected for that purpose in face of the difficulties now to be contended with, although many of these mines would be valuable properties under more favorable circumstances. In this district, as well as in the others, are gravel beds, or perhaps it would be more proper to say, a portion of the vast gravel deposit in the foothills of the Sierra Prieta and Weaver mountains. A little work is being done, but it is mainly in the way of preparation for the next rise of water in the streams. In the bed of Oak creek, a branch of the Hassayampa, water is plentiful at a depth of one to two feet, for the use of rockers, and wages can be made from the sand and gravel in the creek for a distance of more than a mile along its length. Men at work with half a head of water and a small string of sluices shortly before the stream stopped running averaged \$5 per day each. Water runs for eight months of the year, and why the creek bed has not been worked out long ago is a mystery. A painful of sand and gravel scraped up from the surface anywhere will show color, and occasionally nuggets weighing one to ten dollars are found at a depth of six inches to a foot. There is a large section of country hereabouts where any "dead broke" prospector can make more than a living with a rocker in the duldest season.

Lying west of Walnut Grove is Weaver district, the oldest in this part of Arizona, and its placers are the most widely known of any in the Territory. Of the wonderful deposit found on the top of Rich hill mention was made in a previous letter. In Weaver gulch, the head of which lies under the eastern base of this famous hill, and Antelope creek, on its western side, work is done every year during the short season when water runs in these small streams. A considerable quantity of gravel has been dug out of the banks, as on the Hassayampa, for washing when the head of water is sufficient. The land slopes off from the southern side of

the Weaver range in long mesas, and dirt taken from any part of them will give from a few colors to one or more cents to the pan. A number of Mexicans are at work with a dry-washer three miles below Rich hill, and are said to be making \$1.50 to \$2 per day each. Nearly all the work that has been done in the Weaver placers is in the bottom of the gulches, where the small supply of water was made to do as great a duty as possible; but so slight is the showing made that a stranger would never imagine the placers had been worked every year since 1863. If water could be supplied to all this gravel region, embracing an area of several hundred square miles, the annual output of gold should amount to many millions. There are also rich leads of ore in Weaver district. The Leviathan, the highest ledge in the district that has been prospected, is pierced by a tunnel 100 feet in length. It is calculated that it will average \$25 per ton, but has yielded ore which has gone twice as high when worked in arastras. The Bright and Marcus mines in this district have also been developed to a considerable extent. Quartz from the former is now being worked in an arastra. Sulphurets from this mine shipped to Pueblo for reduction have yielded \$275 per ton. These leads, like those in the other districts spoken of, run into sulphurets as they go downward. And nearly all of them, it may be remarked, are in a solid granite formation.

Eight miles further west in the Martinez district, is a promising group of mines, which, for lack of time, was not visited. To the south could be seen the dry, barren Vulture range of mountains in which, in Maricopa county, is the Vulture mine, which has been worked regularly for more than twenty years, and turned out several millions in gold bullion. The ore body is very wide, and, though for the most part of low grade, can be worked profitably. Water for the large stamp mill is pumped from the Hassayampa creek fifteen miles distant, the surrounding country being extremely dry. They have recently struck a body of \$12 ore sixty feet wide, and as they can work about 250 tons a day (twenty-four hours), at an expense of \$3 per ton, they should have a daily income of \$2,250 above running expenses.

The last mineral district visited was Copper Basin on the southern side of the Sierra Prieta mountains and ten miles from Prescott. In this basin is a vast deposit of copper, the extent or depth of which is not accurately known. Shallow prospect holes have been dug, and a few short tunnels run into the sides of the hills where it appears, but no extended development has been made in any one place. One of the most noticeable features is a horizontal shelf of conglomerate five or six feet in thickness, extending along the face of a ridge for a distance of about a mile and a half. Great masses of it have rolled down the hillside in places, and patches of blue and green are everywhere visible. This bed of a little creek below is also stained with green for a considerable distance. Where tunnels have been dug into the hill or shafts sunk, veins of copper are to be seen running through the rock in every direction. A few specimens were collected, consisting of azurite, red oxide and green carbonate, some of which was very rich. A great quantity of ore, including the coarse conglomerate spoken of, will yield twelve or twenty-five per cent in copper, and some will go as high as seventy-five per cent. In an excavation made beneath the horizontal out-cropping that marks the side of the mountain were found broken fragments of pottery, arrow-heads and other relics of a prehistoric race. The projecting roof was blackened with smoke, and bones found among the debris were dyed green by the copper with which everything is impregnated. Our stay in this interesting place was brief—arriving at dark and leaving early the following morning—and so little was seen that the writer is not prepared to say more. The ore body is an immense one, and being situated where water and timber are abundant and only ten miles from Prescott, which will soon be connected with one of the trans-continental railways by a branch line, should be one of the most valuable mining properties in the Territory. Gold is also found in the basin, and silver ore from a ledge now being prospected was shown which assays \$175.

Throughout the several districts spoken of are many mines which promise well, but upon which very little systematic work has been done, owing partly to their isolated situation. As a rule those that have been prospected best are the most promising; and should mills be erected on the ledges of largest size and highest grade, and custom reduction works put up in certain localities and more enterprise shown in the utilization of the water supply for the gravel diggings, the south central part of Yavapai county would soon become the largest gold producing region of equal area in any part of the Pacific Coast, and could also make a respectable showing in the yield of other metals. No one who knows the country will deny that gold exists in paying quantities in rock and earth and that it is not more difficult of extraction than elsewhere, and all will agree that so long as the present slipshod methods are employed by mining men the greater part of the golden treasure will remain where it is, awaiting the advent of a more enterprising class or generation. Lack of means has, of course, retarded the development of several claims, as well as poor facilities for freighting at a cost within the bounds of reason, but the same excuse will not answer for the condition of some others—lodes of high grade ore favor-

ably situated and rich gravel beds that can be supplied with heads of water during a large part of the year by judicious expenditures of money.

Besides the mines mentioned are many others in the several districts passed through, and in a few places arastras and mills have been built for working the ore, but as they were not seen and no authentic information of them ascertained, they are therefore omitted.

GEORGE W. STEWART.

Prescott, A. T., July 18, 1885.

Why Mines Do Not Sell.

EDITORS PRESS:—That there are many mines in this State is not to be disputed; but it is a fact equally certain that very few are ever sold. To read mining items in the newspapers one would conclude properties of this class are being constantly disposed of; but it is doubtful if half a dozen genuine bona fide sales are consummated on the whole coast in a year. A gentleman in San Francisco, who is always ready to undertake the sale of a mine that can stand an honest test, informed me not long since he had not in 20 years sold 3 mines in California or a dozen out of it. To put it briefly, there is no market for mines at home or abroad. It is not difficult to get at the true inwardness of this state of affairs. Mine owners seem to have no idea that the price of a commodity ought to bear some relation to its intrinsic value. If a mine is worth only \$50,000 to the purchaser, it will be found, without fail, that the owner will be asking six times that amount for it. On this basis properties have been sold on the Atlantic Coast and in Europe with the result of killing the industry almost entirely. Indeed, it is as much as a man's life is worth to even mention the word "mine" in the East at present. The whole business is associated in their minds there with chicanery and fraud, and even a solid man who has anything to do with a mine openly is looked upon with distrust and suspicion. Parties here who are indulging in golden dreams of foisting their properties on people abroad for three or four times their value are destined to be grievously disappointed. The unwritten law now insisted on in the purchase of a mine is that it shall have three times as much in sight as the price demanded, and that it shall be producing at such a rate as to return the principal to the buyer in three years. On this basis a sale may be sometimes effected in spite of the prejudice attending the transaction; but even then only as the result of a degree of energy, perseverance and diplomatic skill not often found in mine owners or their representatives. While the prices asked constitute the main reason of mines not selling, there are other causes, however, which co-operate in producing this result. Among these I may instance the difficulty of getting mine owners to listen to anything but cash payments. Now, a large mine never has been and never will be sold for cash in the ordinary acceptance of that term. When capitalists take hold of a mine they first organize a stock company, then they issue shares, floating the same on the market and turning over the proceeds of all sales made, less a fair commission, to the owner, till he receives the full amount agreed on. This is the method usually followed in London, the great center of all mining operations, and where the property is meritorious, always attended by the best of results. The smaller fry of mine owners I find just as exacting on the score of cash payments as their more important brethren.

Now, there are many people who would be only too glad to invest in a mine if they were first allowed to ascertain its value by working it, and not be compelled to purchase blindly. I know of a mine that has long been held at \$25,000. A company offered to put up a mill on it, work it for a year or eighteen months and then pay the price or forfeit the mill and value of all the ore taken out. The offer was refused, and the mine remains unsold. In another case a gentleman was willing to purchase a gravel claim if he was permitted to work it for thirty days; agreeing to turn over the entire product of the run to the owner, in case he did not find results sufficiently satisfactory to buy; refused again. Now, ordinary people can only draw one or two conclusions from this way of doing things—either that the miner is very simple or provincial, or that he has but little confidence in his property; in which event his endeavor to pass it off on anybody is equivalent to an attempt to swindle. Again, there are owners who are willing and even eager to dispose of a mine, and yet will not lay out a cent towards making a sale possible.

A prominent mine was recently offered in the Eastern States. The party to whom it was submitted was not satisfied with the page and a half scrawl which was all the authority, report and description the agent had to show from the owners. He demanded maps, drawings, a report by some reliable expert, the actual yield and expenses, as exhibited by the books—everything to be sworn to and acknowledged before a notary, when he said competent parties would be sent out to verify, and if representations were found to be correct, negotiations would be entered into. What more simple, honest or business-like? And yet the owners refused to listen to the proposition, because it would cost a few hundred dollars to

get up the maps, drawings and reports indicated. Now I am making no attempt to write down mine owners; they are, as a rule, a genial, hearty class of fellows, whom it is pleasant and satisfactory to know; but at the same time I want them to see they are standing in their own light, and that they must reform their methods, especially as regards prices and modes of payment, if they do not want to have their mines on their hands forever. EXPERIENCE.

Bullion at the Mints.

As depositors of bullion at the mints and assay offices are promptly paid in nearly every case the value of their bullion on the succeeding day, almost the entire gold product of the country, except native gold or bars from private refineries used in the arts, is directly or indirectly sent to the mints and assay offices, where an accurate record is made of its character and description, which, as well as the locality from whence derived, except as to bars from some of the large refineries, are in most cases apparent to the weigh clerks upon inspection or easily ascertained by inquiry of the depositor or knowledge of his business.

From these records monthly reports are forwarded to the office of director of the mint, which cannot overestimate or understate the value of such bullion without showing discrepancies readily discovered and corrected between these statements and the quarterly accounts rendered by the officers, which also give the value and the amount paid for such bullion. The erroneous designation of foreign bullion as domestic rarely happens, except where refined bullion received from private refineries consists of gold bars, which, although made up in part from foreign bullion, are recorded as domestic bullion. But the statements furnished by these refineries show the amount of such bullion, and this amount is deducted from the reported receipts of domestic gold at the mints and assay offices, or is offset against undeposited and unrefined gold production used in the arts, ornamentation, etc. Indeed, it might be claimed that some of the gold deposits reported as foreign bullion are domestic, and that an addition should be made to the estimated production on this account; for the amount of foreign gold bullion reported as deposited at the mints and assay offices annually exceeds, by several hundred thousand dollars, the imports of such foreign bullion entered at the custom house. But this excess probably arises from this receipt of bullion brought from Nova Scotia and Mexico across the border without being entered in the custom house returns.

The total deposits of gold and silver and purchasers of silver bullion during the year 1884 at the institutions under the charge of the mint director, exclusive of the redeposits, amounted to \$50,519,886 gold; silver, \$36,671,088. Of the gold \$266,877 was of United States coin; \$6,328,922 foreign coin; \$11,217,309 foreign bullion; \$1,899,577 jewelry, plate, etc., and \$30,807,200 was of domestic production.

The custom house returns report the export of \$115,963 of domestic gold bullion, exclusive of \$22,950,259 United States mint or assay office gold bars.

It might be proper to add to the deposits of domestic bullion this sum, \$115,963, and the value of the gold, some \$600,000, contained in the silver bullion exported, and also the amount of undeposited gold used in the arts and ornamentation, which, in the form of nuggets, native grains, etc., appears from responses to inquiries to have been for that year over \$700,000, and in the form of bars from private refineries at least \$200,000, for the excess of the production of one refinery on the Pacific Coast over its deposits at the mint and the export of its gold bars during that year was \$130,000. These amounts added to the gold deposits would increase the production of domestic gold not less than \$1,500,000. But of foreign gold bullion received at San Francisco from British Columbia and the northern States of Mexico, amounting to about \$1,100,000, only \$400,000 was deposited at the San Francisco mint as foreign bullion, and the remainder, as shown by the statement of private refineries, was refined before its deposit at the mint, and was included in the returns from that institution of refined gold of domestic production.

SCHOOL OF MINES WORK.—The Colorado School of Mines, acting under orders from Governor Eaton, has commenced a work which it is hoped will be a great benefit to the mining industry of the State. Four gentlemen have been appointed to examine and report during the season on special branches of the mining interests of Colorado. One goes to the district comprising Georgetown and Central City. One inspects the iron mines of the State, another the coal mines, and the fourth, Mr. M. C. Ihlenseng, is deputed to examine the San Juan country, with a special view to inquiring into its mineral resources, productions and method of the treatment and concentration of ores. A great effort will be made to ascertain why ore is not concentrated as successfully in this country as in Europe. While in Europe the excess of loss in concentration is 10 per cent, and the average loss between four and ten, in this country the most successful works have only been able to save 65 per cent of the whole.—*Denver Journal of Commerce*.

MECHANICAL PROGRESS.

Supplying a Demand.

Prejudice, says the *American Machinist*, has a good deal to do even with as enlightened a business as that of the machinist. Sometimes a manufacturer is, naturally enough, impressed with the idea that the best place to sell good tools and machines is where they are needed most, that is where they are using poor ones, but in the end finds that it needs more missionary work than he is prepared to engage in, and comes to the conclusion that it is easier and more profitable to sell to those who know the advantages of such things by experience.

Old tools and obsolete machinery stand in many places like old friends—not to be lightly put away in favor of something new. After all, the old engine turns over, which is just what the new one will do, or the old lathe runs with a belt just like the new one. These are arguments that cannot be opposed, and are sometimes conclusive.

More than one machinist, looking around for an opportunity to start in business in a moderate way, has come to the conclusion that his best opportunity would be where his work and tools would be a hundred per cent better than anything there, and found in the end that he had a hard job to get a chance to compete with old tools and methods with which every one was familiar. This is not mere fancy, as many have found out through an unpleasant experience. When a man is thoroughly satisfied that he can get along with poor work, done in twice the time that it ought to be done in, argument in favor of something better is wasted on him. It is more fruitful to talk to the man who is not satisfied. The demand for better things comes from those who are never entirely satisfied with what they have.

There are localities where the best classes of steam engine find no sale, as well as those where none others are used. And so it is sometimes with machine tools, and to some extent with the work done with them. "Yankee" tools, "gilt-edge" and "high-toned" are terms sometimes used to express ignorance of the qualities of design and workmanship. It is valuable work to reform opinion in such places, but it is not an easy thing to do.

In supplying foreign demands, prejudices has to be carefully studied. It is what those who buy think they want, and not what the manufacturer knows they ought to have that must be supplied. In the end, it is to be expected that everywhere the best will reach the head, but the end may be so far away as to make it useless to work for it, except in a spirit of pure benevolence, in favor of succeeding generations. The question of supply and demand is always the important one, only demand must generally come first. When the demand is for the best that is to be had, the manufacturer who supplies such, or the machinist who proposes to do good work, finds an opening, because he can supply the demand. When the reverse of this is true, the supply must be of another kind.

Deterioration of Iron.

For fourteen years Dr. Collett, State Geologist of Indiana, has been experimenting and studying the action of iron under various circumstances of use and duty. The results of his experiments and observations have much interest and importance to the machinist and engineer. He holds, in the light of his study, as above, that the best iron, when subjected to continuous strain, will undergo changes in its structure which will, after a time, render its use dangerous, and that these structural changes afford the explanation of many otherwise inexplicable accidents, particularly to railway bridges. He has lately undertaken a systematic investigation, which has resulted in the confirmation of his theory. For experiment he took from the Walsh dam, at Delphi, a number of bolts and spikes, which were, when the dam was constructed, of the best quality of malleable bar iron, as is shown by the hattering of the head when they were put into the structure. Of these bolts and spikes he found that 70 per cent of the whole number were as weak as cast-iron, while 90 per cent of those which were near the bottom of the dam were worthless; yet, of those which were rotten, the tips where inserted in immovable rocks were fibrous and strong. When broken they showed polished ends to the connecting fibers, indicating that the continued vibrations of many years had polished and rounded the points of fibrous structure. A similar effect is found in "the partings," or "horsebacks," in coal mines, which become polished and striated by the continuous quiver and motion of the crust of the earth. Dr. Collett says that all car axles, after a reasonable run, become crystallized two-thirds of the length from the hub and one-third from the outside extremity, rendering them worthless. On one Indiana railroad bridge he found that the bottom parts of the vertical strain pieces were crystallized for from two to four feet in length, and, as a precaution against what would invariably have caused a great catastrophe, they were replaced. The matter is one of great interest to railways, and the specimens which Dr. Collett has collected in his experiments are to be sent to the Stevens Institute of Technology, where an investigation of the subject has been in progress for years by a scientist connected with the institute.

GENERAL MACHINE WORKS.—The effort on this part of most machine shop proprietors in this country, for the past few years, has been to change from general work to specialties—to convert the machine shop into a manufacturing establishment. In many instances, it looks as if the plan had been too well carried out. Shops that are ready for jobs out of the line of regularly manufactured specialties are, we believe, as a rule, better provided at the present with work than those engaged on specialties. There will always be room for a fair number of good shops, well fitted for taking hold of jobs not in any special line of manufacture. A certain proportion—not a small proportion either—of machine work is general in its character. Jobs, large and small, are constantly wanted that will never require duplication, and these naturally find their way to shops that are well provided for doing them at reasonable cost without special appliances. Again, there is always being constructed a large amount of experimental machinery, in which important modifications will be made before it passes to the stage of manufacture. The general machine shop should be able to bring this machinery up to the point of manufacture, and then pass it along to those who will arrange for systematic manufacture. Good tools, judiciously selected for this kind of work, and above all, the best kind of shop management, is required for this. With these the general machine shop is not always the one that is left in the race for business. The ability to handle a variety of general work, so as to get it out well and cheaply, has come to be more of a specialty than the manufacture of any particular line of machinery. There is, in the future, fair prospects for the general machine shop ready to take hold of a job without any red-tape preparation.—*American Machinist*.

"LIMBERING" UP.—If it were more clearly understood that mere flexibility in machinery, as the term is often used, does not necessarily mean a correct case of motion, says the *Industrial World*, there would be a good deal gained in the interest of economy and of efficiency, although these two words mean very much the same thing. It is customary to speak of the "limbering" up of a machine by or during the first few days that it is run, but this word may have two very different meanings. One is that all the moving parts have become thoroughly oiled and polished, as they only can by actual working; they should be held in place loosely, all the building bolts and adjusting screws being left slack for this purpose. The other meaning, often very incorrect or injudicious in its application, implies that little or no exact workmanship need be used in the fitting or erection of machinery so long as things are left loose to "find their bearings," as the term is, the misfortune really being that most things, when left to themselves, are likely to move out of correct adjustment as well as to remain in it, the usual result of any actual working being to cause a loss of accuracy from the first.

IRON AND STEEL UNDER THE MICROSCOPE.—Eminent metallurgical chemists, experimenting with steel under a powerful microscope, have discovered the relative conditions of the iron and carbon particles in steel. The fine granular appearance of steel, so well known when closely examined under the microscope, is found to consist of a multitude of minute cells, the nucleus of each cell being formed of iron and carbon forming the outer skin. The investigators who have made this discovery expect to be able, in the course of further researches, to demonstrate the position that impurities such as phosphorus, sulphur and silicon hold in the structure of steel. This line of inquiry is likely to produce valuable results in showing exactly the structural changes that take place on steel under conditions approximate to what it has to endure in ordinary service. At present there is exceedingly little real knowledge respecting the changes that take place in the internal arrangement of metals under service.

THE AMERICAN EXHIBITION IN LONDON.—Mr. J. G. Speed, general commissioner of the American exhibition that will be opened in London on May 1, 1886, says: "The chief object of the exhibition is to give Englishmen who want to invest capital a chance to form an intelligent opinion of what the opportunities in this country are. It will be an exhibition of American products only. It is proposed that the railroads shall thus advertise their advantages, the States their products and the manufacturers their wares. Samples of everything that this country has for sale will be exhibited. It will be the first exhibition of the kind ever made."

SHEAR STEEL.—Shear steel is made by taking a high heat on blister steel and hammering it thoroughly. Double shear steel is made by cutting up shear steel, piling it, heating it, then hammering it again. The heat shear steel must be made from the best wrought iron. The shear steels are very useful on account of their toughness and the ease with which they can be welded to iron, and, when of good quality and well worked, they will hold a very fine edge.

ADHESIVE POWER OF NAILS AND SCREWS.—Spike nails in fir is from 460 to 730 pounds per inch in length, while the adhesive power of screws, 2 in. long, 0.22 in. in diameter at the exterior of the threads, twelve to the inch, driven into $\frac{1}{2}$ -in. boards, was 790 pounds in hard wood, and about one-half that amount in soft wood.

SCIENTIFIC PROGRESS.

FORMIC ACID.—This acid which is found in ants, from which it takes its name, is also contained in nettles (herba urticae), and in some pine needles, from which it is obtained by distillation with water. It is also a product of the oxidation of various organic substances, especially of sugar, starch, etc. In the animal system it is found in the sweat, blood and urine in very small quantities. It is also produced by the oxidation of methyl alcohol, by the decomposition of chloroform, iodoform, and bromoform with potassium hydrate, in the form of potash salt, and from hydrocyanic acid. It may also be synthetically prepared from carbon monoxide and potassium hydrate. Formic acid is generally obtained by the decomposition of oxalic acid in the presence of glycerine, the oxalic acid being split up into carbon dioxide and formic acid. Equal parts of oxalic acid, dried at 100 deg. C., and glycerine are heated to 110 deg. C. until the evolution of carbon dioxide ceases. The oily mass is then mixed with water and distilled. In this way a dilute acid is obtained. The pure acid is prepared by decomposing the lead salt with hydrosulphuric acid.

CHEMICAL ELEMENTS IN MARBLE.—The interesting discovery has been made by M. Dicuclafait that manganese, in the state of bicarbonate, exists in the waters of all seas and oceans, and the fact also appears that, in contact with oxygen, this bicarbonate becomes binoxide; it follows, therefore, that oxides of manganese must be produced in large quantity in the ocean, and sinking by its weight must accumulate on the ocean-bed. Thus is explained the existence of the large amount of binoxide of manganese concretions and manganese mud found in the sea-bed. It also accounts for the presence of manganese in the French and English chalks of the secondary period, and for the interesting fact recently made known, that the famous artistic marbles of Carrara, Paros and the Pyrenees are comparatively rich in manganese. There are two kinds of Carrara marble—the ordinary, which has a bluish tinge on fracture, and the statuary marble, so very pure and white—in both of which the well-known chemical reaction shows manganese. Parian marble, which has larger grains than Carrara, also shows manganese in even greater proportion than the latter; and the Pyrenean marbles, which resemble the Carrara in being of two qualities, contain manganese in similar degree.

HEAT, LIGHT AND VEGETATION.—THE TIME TO PLANT.—Dr. Hellriegel has found that it is very important to plant development that the time of seed forming and the season of greatest heat and light should be coincident. He has illustrated this by experiments in which he sowed barley under otherwise identical conditions, on April 21, May 28, June 28, August 2, and September 1; the first crop becoming ripe in 88 days, the second prematurely ripe in 87 days, (the maximum heat and light happening too early in the plant's growth), the third ripening imperfectly in 150 days, the fourth in 200, and the last in 240 days. From this it appears that the productiveness of a country depends not so much on its mean temperature as on the question whether its supply of heat is received at the right time, and in England the wheat harvest is known to be chiefly determined by the temperature during July and August. Under glass plants are subject to a great reduction of light, which, with other unfavorable conditions of hot-houses, Dr. Hellriegel has shown to diminish very seriously the fruitfulness of plants. There is little difference, however, in the influence of different colors of light.

UNIVERSITY EDUCATION.—England, with a population of 25,000,000, sends 5,000 students to her two universities; Scotland, with her 4,000,000, has 6,500 university students; Germany, with 48,000,000, sends 23,500 to her numerous universities; and New England, with a population of 4,100,000, has 4,000 students in her eighteen universities and colleges. According to the above figures, Scotland leads all the rest in the matter of the most general diffusion of university education among her people. She sends to the university one in every 675 of her population. Then England comes next with one in 1,025. Germany stands third, and educates one in every 2,042; while England educates only one in 5,000 of her population.

OIL IN STORMS AT SEA.—The Hydrographic Office of the Navy Department has for several months been engaged in collecting data to determine under what circumstances the use of oil is most efficacious in diminishing the danger of breaking seas during gales of wind. When sufficient data have been collected, it is proposed to issue a pamphlet giving such directions in regard to the use of oil as common experience of seamen may determine to be best. Such a publication will undoubtedly be of vast benefit in saving life and property at sea. It is to be hoped that no unnecessary delay will be permitted in placing before the world the information promised.

THE HUMMING OF TELEGRAPH WIRES.—The humming noise which frequently proceeds from telegraph wires has usually been ascribed to the vibration of the wires under the influence of the wind. The fact is brought out, however, in a recent issue of the *Popular Science News*,

that this humming noise is often very loud and intense on still nights when not a breath of air is stirring. This fact we have also observed. It would appear probable, therefore, that there is some other cause involved, which it might repay some interested electrician to search for.

MAGNETS OF HARD STEEL.—An electrical contemporary informs us that bars of file-tempered steel may be strongly magnetized by the following method, and great permanency secured: An old file, for example, is placed in a coil of moderate-sized wire, with one end resting against a block of iron; one of the wires from a dynamo is connected to one end of the coil wire; to the other end of the coil wire is attached a small block of iron, which rests against the free end of the file; the other wire from the dynamo is attached to a good-sized hammer, the face of which is past injury by the spark. It is clear that, when the block to which is attached the coil wire is struck by the hammer against the end of the file, it gives it a mechanical shock, while at the same instant the current passes through the coil, which, being instantaneous, will not injure it, even though very powerful. By this plan of combined mechanical and electrical shock, the molecules of the hard steel are jarred into position.

THE METAL GALLIUM.—It is stated of the new metal gallium, that with the exception of mercury, which only becomes solid at 37.9° Fah., there is no other element which liquefies at so low a temperature. It melts at 81.1° Fah., so that it liquefies when held in the hand. The metal is hard and resistant, even to a few degrees below the melting point. It can be cut, and possesses a slight malleability. When fused it adheres easily to glass, on which it forms a beautiful mirror, whiter than that produced by mercury. It oxidizes but very superficially when heated to redness in air, and does not become volatile. Unlike lead, it acquires only a very slight tarnish on exposure to moist air. Its specific gravity is a little under 6, that of aluminum being 2.6, that of zinc, 7.1, and that of lead 11.4. Unlike lead, again, gallium is a highly crystalline metal, its form being that of a square octahedron. In its chemical characteristics the rare element gallium shows the greatest analogy to the abundant element aluminum.

A WELL-MERITED COMPLIMENT.—The Franklin Institute, having been invited by the British Society for the Encouragement of Arts, Manufactures and Commerce, to nominate a suitable person to receive the "Albert Medal," has proposed the name of Mr. William Sellers, for his improvements in the construction of machine tools, which has been the model for machinists of all nations; and for his origination of the system of screw threads, which bears his name, and which received the approval of the Institute, and has been adopted by the Government of the United States.

COCAINE, the new local anesthetic that has suddenly achieved such an excellent reputation, has been known as such for a great many years, but for a long time was found to be too expensive for general use. The great progress now is the cheapening of the product. Its properties are due to a substance nearly identical with theine, the active principle in tea, and it is, indeed, obtained from one of the tea plants—the mate, of Paraguay. This is known botanically as *Erythroxylon coca*, cocaine, of course, being derived from the specific name.

GAS VS. COAL.—On the first of July it is said that every iron and steel mill in Pittsburgh and vicinity, with one exception, was using natural gas as a fuel. This will reduce the consumption of coal 38,250,000 bushels per annum, or one-seventh of the yearly output of the region tributary to Pittsburgh, and will throw out of employment thousands of firemen, coal-heavers and ash-haulers employed in the mills—truly an important revolution for which nature, rather than art or invention, is responsible.

REMARKABLE PHOTOGRAPHIC WORK.—Prof. Mach, of Prague, has obtained some remarkable photographs of a pistol hull in its flight under the illumination of an electric spark. He has also photographed the air streams which are seen over a Bunsen burner placed in sunshine, and has obtained pictures of waves of sound, these last being made visible by a method in which advantage is taken of the irregular refraction of light by the waves set in vibration by sound.

A NEW MODE OF OBTAINING OXYGEN.—Pure oxygen and the oxygen as it exists in the atmosphere have been proved to the satisfaction of M. L. Troost capable of passing through the sides of a heated tube of silver, but that only a mere trace of nitrogen found its way through the silver. It is suggested that pure oxygen may be obtained from the atmosphere by taking advantage of this permeability of silver to oxygen gas, but the metal must not be heated above 500° C.

SPONTANEOUS COMBUSTION FROM COAL DUST.—This conclusion has been reached by Mons. Fayol that the absorption of atmospheric oxygen by coal dust usually produces the rise in temperature to which spontaneous combustion is due. He finds that lignite is ignited at the low temperature of 300 degrees, anthracite at 575 degrees and other varieties of coal, in powdered form, at intermediate temperature.

Passing Events.

Locally considered the past has been an uneventful week other than the universally observed obsequies of General Grant have served to distinguish it. Never has the popular heart been so touched, or the emblems of sorrow so abounded in the city before. But this sorrow came so gently that it failed to take any frantic form—like the twilight it fell softly on the nation, and like the twilight traveled round the world. He glorified us and we have glorified him. We rest, for we shall never be called upon to perform another such service, as none will probably ever come to deserve it.

As minor events we note that Judge McFarland, of Sacramento, has granted the mandamus ordering Controller Dunn to draw his warrant in favor of debris dam contractors, notwithstanding the Supreme Court has decided the act authorizing the constitution of these days to be unconstitutional. Judge McFarland, however, takes the ground that the law was valid up till the time it was pronounced unconstitutional, therefore the claims that had accrued in the interview were also valid.

Col. Demby, minister to Peking, has arrived in the city and is to be duly enlightened on the Chinese question, the municipal authorities having taken steps to that end—the local papers are also helping on the good work after their way. During the week the Spring Valley Company let the water into their new reservoir in South San Francisco, nearly doubling the city supply. The question of securing better drainage in the south part of the city as a sanitary measure is claiming much consideration at the hands of our supervisors.

Accepting the Situation.

We judge from the tone of the Eastern press and from conversations had with parties recently returned from the other side of the continent that the mines of California are at a discount among business men, capitalists, bankers, and all other classes over there. To such extent is this the case that parties buying or taking any interest in California properties of this kind consider it politic to do so in a clandestine way, fearing it might hurt their credit were the fact to become generally known. We are assured that it is quite useless for any one to go East at the present time hoping to sell mines or enlist capital in any mining enterprise in this State, however strong the testimonials in favor of either. Parties arriving in any of the larger cities on the Atlantic seaboard are at once advised that nothing in that line is wanted, notices being sometimes conspicuously posted in the stores, offices and other places of business to that effect, the more timid people cautioning visitants against "talking mines" when customers are about.

Now, we suppose this is all right—these people, no doubt, have or think they have, good reasons for so letting our mines severely alone. Some of them have lost here a good deal of money. It is none of our business that they have lost even more heavily in speculations elsewhere. When men have lost money, no matter where or how, it is the dictate of prudence and business sense that they exercise greater caution in the future; and if this caution becomes extreme, amounting sometimes to timidity, so much the better for them and none the worse for us, because most of the money they lost in mining ventures here went into the pockets of reckless speculators, incompetents and swindlers, who in turn spent the greater part of it in fast living and other illegitimate ways, very little of it ever having been applied to the development and outfitting of the mines. We, therefore, find no fault with the course these Eastern people are taking in this regard; we approve of it, and hope they will not relax their vigilance, or abate one jot of this wholesome distrust of parties who come among them trying to sell mines or promote mining schemes in this State.

At the same time we know very well that we have here a great many good mines, some of which offer excellent opportunities for investment. Gold mining is in a very healthful condition with us at present, and its future is full of encouragement. The business here is bound to come up. It may not, and we hope it will not, come up with a clang and a burrah, but it is coming up surely, steadily and to stay. We would be the better of a little outside assistance, but we can get along without it, and rather than see investors abroad lose or even imperil their means we would forego any expected benefits contingent on their taking such risks.

So comparatively little noise has been made about mining in California of late that many no doubt suppose the business has declined in a corresponding degree. Such, however, is far from being the case, this industry having been growing steadily for several years past, as the increased product of bullion shows. We returned but a week or two since from a trip through the more central and important mining counties of the State, and not in an experience of thirty seven years in the mines have we seen them in a more satisfactory condition than at this time. We do not mean that as much gold is being taken out or that individual earnings are as large now as aforetime, but that the business is rewarding both capital and labor fairly, and at the same time with much greater certainty than in the flush days of mining. Though not so remunerative, it is by no means as hazardous now as then, nor is it attended with so much danger and discomfort.

In speaking of earnings, it will, too, surprise many to be told that they are not, on an average, so much less now than they were 20 or 30 years ago. Our annual production of bullion amounts now to, say, \$18,000,000. Estimating that there are at present 30,000 men at work in the mines of this State this gives \$600 annual earnings per man. In 1854 the bullion output of the State amounted to \$65,000,000, which, supposing there were 200,000 men employed in the mines that year, gave only \$325 as their individual earnings. But then these earnings

were made without the aid of capital, a good deal of which is now required in operating our mines. Considering how much they earn and how cheaply they can live, the California miners are in a position to lay up more money than any other class of laborers in the State. While a majority of our gold miners are self employers, many work on hire; but these always receive good wages, generally from \$2 to \$3 per day, their average wages being about \$2 and found.

Many good judges are of the opinion that bullion production has reached here its point of greatest depression, and that from this time on for many years to come it will undergo a slight but steady increase.

This opinion is based mainly on the expected rapid development of the quartz mines, of which we have so many that will pay for working in California. This branch of the business is, as before observed, both active and prosperous, new lodes being opened and mills put up everywhere throughout the mining regions of the State. Drift operations are also being extended wherever this class of mining is practicable, the partial cessation of hydraulic work in the more central districts having diverted attention to the old river channels, the principal sites of the drift deposits. From these channels a great deal of gold will hereafter be taken, since ten times as many men as are now at work might be employed there to advantage. With capital to open up these vast repositories of wealth, they might be made to yield ten or fifteen million dollars annually instead of only two or three millions as at present. When it is considered that our other branches of placer mining ought to turn out at least ten and our quartz mines fifteen million dollars every year, there is nothing extravagant in predicting for California a return to something like her old-time bullion production—say thirty million dollars per annum inside of the next ten years.

Improved Mining Outlook in Nevada.

As is well known, the bullion product of the State of Nevada has been gradually declining for the past seven or eight years; that is to say, ever since the exhaustion of the Consolidated Virginia and California bonanza on the Comstock range. This declension having been so marked and having continued for so long a time the opinion had begun to prevail that this State would never be restored or come anywhere near being restored to her former position as a bullion producer. And so, faith in the mineral resources of Nevada fell at last to a very low ebb. An interregnum had, it is true, occurred more than once before in the Comstock production, but none had been so notable or protracted as this. Meantime, the confidently expected and much hoped for developments elsewhere in the State were delayed and the prolific ore bodies in various mines that had been yielding liberally began to dwindle, and in some cases went out altogether. Treasure Hill, in White Pine, remained a perpetual disappointment, no second Eberhardt having to this day been unearthed there, though sought after persistently and with large expenditure of labor and money; and so of a score of other once encouraging localities scattered all over the State—localities that kept the promise to the ear, but broke it to the hope, and, to make matters worse, while such diligent and prolonged search after new ore deposits were so barren of fruition nearly all the more largely productive mines, as above stated, began to fail.

The output at Eureka year by year suffered contraction; Reese River, after a short-lived prosperity went under a cloud. The marvelous wealth of the Sheba vanished in a day, and the other Humboldt mines prematurely petered out; Pioche perished suddenly; the Northern Belle, after a short flirtation, bowed a sad lack of staying powers, and the bodies near by were carried off with a galloping consumption, yet discoveries of big things were all the while being announced, the most of them proving in the end as illusory as the mirage that dances over the Nevada deserts. Baffled in their efforts to find new bonanzas, or even remunerative ore bodies, the prospectors sought other and more promising fields of endeavor, and the mining population of Nevada decreased so rapidly that there was at one time a talk of disorganizing the State and relegating it to a territorial condition, though such procedure was probably never

seriously contemplated by a majority, or even any large number of the people.

But now comes the U. S. Surveyor General, of Nevada, with the information that her wealth of gold and silver is really very considerable—greater, perhaps, than she is just now being credited with, if not all that the pioneer prospector supposed it to be. The bullion yield of the State for the current year will, we are told, approximate \$10,000,000, being considerably larger than it was last year. The Surveyor-General also claims that it has been demonstrated that rich ore exists more than 3,000 feet below the surface of the earth, and that the Hale and Norcross mine is entitled to the credit of making the first bullion shipment from such a great depth. The daily ore product of the Comstock mines is 600 tons, keeping over 200 stamps on the Carson river constantly employed in crushing it. The ore is low grade, but returns a fair profit above expenses of mining and milling. By reason of this, extensive prospecting operations are being carried on in nearly every prominent mine on the lode, and there is every probability that valuable discoveries will be made in the near future.

It may be true as here stated, that some rich ore has been found in the Hale and Norcross mine at a depth of more than 3,000 feet. The importance of this fact depends, however, on how much of this ore has or is likely to be found and upon how rich it is. If it is of only medium grade, no matter how much there may be, it cannot, under the circumstances, be mined, brought to the surface and milled with profit; and so, on the other hand, no matter how rich it may be, if there shall prove to be but little of it, the find can be of no great consequence. If by reason of this find other companies on the Comstock have been encouraged to engage in extensive prospecting operations, as the Surveyor-General states, there is a chance that this Hale and Norcross revelation will result in more harm than good. Would it not be more prudent for these companies to wait a little, and before expending their money see what is likely to come of this embryonic bonanza? Possibly it may turn out to be of only Lilliputian dimensions, and may even fall still-born as have so many of these Comstock conceptions. In their action, however, these companies are but repeating the old error—rushing ahead and squandering their means, when by a little delay they might be able to determine whether the prospect would justify any further exploratory work being done or not.

Continuing his remarks on the improved condition and prospects of mining in the State, this official adds that Tuscarora is still contributing to the wealth of the country. Eureka, Austin and Candelaria have done fairly well during the past year, and will do better in the future. But there are hundreds of small mines scattered throughout the State which have caused the bullion yield to be greater than last year's product, and from these have come the mineral to more than make up the deficit of the hitherto big districts. Prospecting is being as keenly followed as ever, and there would be an immense "boom" in that line if the prospector could be placed on the same footing as the farmer. The greatest need of Nevada to-day is reduction works. What Colorado has done can, it is claimed, be discounted in Nevada, but private capital seemingly has so many attractions elsewhere that it is loath to take hold of any enterprise in the State. An enlightened public sentiment will, in the opinion of the Surveyor General, soon demand that the State itself shall maintain reduction works in connection with this State University. This would, he thinks, prove a profitable investment to all concerned, and make work for hundreds, homes for thousands, and business for all.

We very much doubt the policy of the State engaging in the business of ore reduction as here suggested. There were once put up near the site of this State University extensive and very complete reduction works but they failed, partly because the expense of carrying them on at that point was too great and partly through want of support. The Selby Smelting Company are now erecting reduction works at a point in this State convenient to the mines of Nevada. As these works are to be of large capacity and as perfect as any in the world, we think it would be better that the refractory Nevada ores be brought to these new works for treatment, since once on the cars the additional cost of bringing them on to that point would be but trifling.

In concluding this branch of his report the Surveyor-General expresses the belief that mining is but in its infancy in Nevada, and under proper systems that State will some day resume her former position as the richest mineral State in the Union.

Sympathizing in the above hopeful view, we await the time that the "Sagebrush" State shall be restored to something of her old-time prosperity and standing, leaving the while something of her old-time mistakes, errors and extravagance behind.

Wrought-Iron Direct From the Ore.

(Continued from page 97.)

further utilized by passing it under the boilers for this generation of steam, and the heat lost in the gases, when they finally escape, is very small. In a blast furnace the carbon is at first burned only to carbonic oxide, and the products of combustion issues mainly in this form from the top of the furnace. Then a portion of the heat resulting from the subsequent burning of these gases is pretty well utilized in making steam to supply the power required about the works, but the rest of the gas can only be utilized for heating the blast, and here there is an enormous waste, the amount of heat returned to the furnace by the heated blast being very small in proportion to the amount generated by the burning of that portion of carbonic oxide expended in heating it, and the gases escape from both the hot blast and the boilers at a high temperature.

In the direct process under consideration the fuel burned is more completely utilized than in the puddling process to which the cast-iron from the blast furnace is subjected to convert it into wrought-iron.

The economy claimed for this process over the blast furnace and puddling practice for the production of wrought-iron is that nearly all the fuel used in the puddling operation is saved, and that with about the same amount of fuel used in the blast furnace to produce a ton of pig-iron, a ton of wrought-iron blooms can be made. I had no opportunity of weighing the charges of ore and coal used, but I saw the process in actual operation at Rockaway, N. J. The iron produced was hammered up into good solid blooms, containing but little cinder. The muck-bar made from the blooms was fibrous in fracture, and showed every appearance of good iron. I am informed by the manager of the Sanderson Brothers' steel works, at Syracuse, N. Y., that they purchased blooms made by the Wilson process in 1881-82, that none of them showed red-shortness, and that they discontinued their use only on account of the injurious action of the titanium they contained on the melting-pots. These blooms were made from magnetic sands from the Long Island and Connecticut Coasts.

The annexed drawing shows the construction of the furnace employed. I quote from the published description.

"The upper part, or deoxidizer, is supported on a strong mantle plate, resting on four cast-iron columns.

"The retorts and flues are made entirely of fire-brick from special patterns. The outside is protected by a wrought-iron jacket made of No. 14 iron. The puddling-furnace is of the ordinary construction, except in the working-bottom, which is made longer to accommodate two charges of ore, and thus utilize more of the waste heat in reducing the ore to metallic iron.

"The operation of the furnace is as follows: The pulverized ore is mixed with 20 per cent of pulverized charcoal or coke, and is fed into an elevator which discharges into the hopper on the deoxidizer leading into the retorts marked C. These retorts are proportioned so that they will hold ore enough to run the puddling furnace 24 hours—the time required for perfect deoxidization. After the retorts are filled, a fire is started in the furnace, and the products of combustion pass up through the main flue, or well B, where they are deflected by the arch, and pass out through suitable openings, as indicated by arrows, into the down-takes marked E, and out through an annular flue, where they are passed under a boiler.

"It will be noticed that the ore is exposed to the waste heat on three sides of the retorts, and owing to the great surface so exposed, the ore is very thoroughly deoxidized, and reduced in the retorts before it is introduced into the puddling furnaces for final reduction. The curved cast-iron pipes marked D are provided with slides, and are for the purpose of introducing the deoxidized ore into the second bottom of the furnace. As before stated, the furnace is intended to accommodate two charges of ore, and as fast as it is balled up and taken out

of the working bottom, the charge remaining in the second bottom is worked up in the place occupied by the first charge and a new charge is introduced. As fast as the ore is drawn out from the retorts the elevator supplies a new lot, so that the retorts are always filled, thus making the process continuous."

The temperature of the charge in the deoxidizer is from 800° to 1,000° F.

The Imperfections of Our Mining Laws and Their Amendment.

As is well known, the laws governing the locating, holding and working of mines on our public domain are in many respects crude, impetitic and otherwise imperfect. Considering the circumstances under which these laws originated it could not well have been much different. Without experience in this branch of mining, with no codes at hand adapted to the anomalous conditions that existed, neither the miners themselves nor our legislators were competent to frame such laws and regulations as were adapted to meet the exigencies of the occasion. As a consequence, things were suffered to go for a time at first pretty much at haphazard, the methods of taking up and securing mining ground being left to be governed mainly by district laws and local usages, these being without uniformity and sometimes not very wise in their provisions. Even when laws came to be enacted by Congress and the local Legislatures, they were still marked by such

deficient and oracular, these being conditions favorable to the multiplication of suits and their protraction after being bought. Now, so it is, the lawyers constitute a majority in all legislative bodies, and it not being to their interest to unify and perfect the mining code, the prospect of this being accomplished at an early date is not encouraging.

Perhaps the best plan for effecting this would be that suggested by Dr. Raymond, that is, submit the business to the Institute of Mining Engineers, and let a proper mining code be framed by a committee of that body, to be afterwards presented to Congress for their consideration and adoption. No other set of men that could be named is so well qualified to properly discharge a duty of this kind as the members of the Institute, they being familiar not only with mining as a business, but also with the mines of the West, and well acquainted with the mining laws and usages of both this and all other countries.

Measurement of Water and Description of Weir Dam.

When a man has concluded to improve a water power, the first thing he should ascertain is the amount of head and fall he can secure. The next, and most important step, is to determine accurately the quantity of water that flows in the stream (provided there is a limited supply), as upon this will depend the amount of power, and consequently the amount of work the

he made of the depth of water over the top of stake E, as illustrated in the cut by the man with square and measure in his hand. Such measurement gives the true depth of water passing over the notch, since, if measured directly on the notch or the board, the curvature of the water in passing would reduce the depth, giving the improper measure. Although, where accuracy is not required, such a method will give a fair estimate of the quantity of water; in all cases it is best to make the measurement over the stake. The line D is a level from the bottom of notch B to the top of stake E; while the dotted line C represents the top of the water, and the distance between the lines or from the top of stake, gives the true depth or spill over the weir. The lines have, in the cut, the appearance of running over the top of the board; but this is owing to the fact that they pass behind it, and, for the purpose of illustration, the reader is supposed to look through the board and the post. The surface of the water below the board should not be nearer the notch B than ten inches, that the flow of water over the notch may not be impeded. Neither should the nature of the channel above the board be such as to force or hurry the water to the board, but it should be of ample width and depth to allow the water to approach the notch and board steadily and quietly. If the water passes the channel rapidly it will be forced over the notch, and a larger quantity will pass than if allowed to spill from a large body moving slowly.

When the depth of water over the stake E is known, the quantity of water passing can be easily calculated by reference to the Weir table appended. This table gives the number of cubic feet of water passing per minute over a weir for each inch in breadth, from one-sixteenth of an inch in depth to 25 inches in depth. The figures 1, 2, 3, etc., in the first and last perpendicular columns, are the inches depth of water over weir, while the first or top horizontal column represents fractional parts of an inch, from one-sixteenth to sixteen-hundredths.

The body of the table shows the cubic feet and decimal parts of a cubic foot that will pass each minute for each depth of weir from one-sixteenth to 25 inches, as before stated. But each result is for but one inch in width; so, of any particular number of inches breadth of weir the result obtained in the table must be multiplied by the number of inches of breadth the weir may be. For example, suppose the notch or weir be 20 inches wide, and the water at stake E, 5 1/2 inches deep; on the first or last column find the figure 5 1/2, follow the horizontal column until the perpendicular column is reached, containing 1 1/2 at the top. In the square where these two columns meet will be found 5.18 (five and eighteen hundredths) cubic feet. This is the quantity of water that will pass for each inch in width; but, since the supposed weir was 20 inches wide, this result must be multiplied by 20, which gives 103.6 (one hundred and three and six tenths) cubic feet per minute. In this manner the water passing any width of weir, of any depth from one-sixteenth of an inch to 25 inches, can be easily calculated.

Weir Table from one-sixteenth inch depth to twenty-five inches depth.

Treatment of Dry and Base Silver Ores.

(Continued from last week.)

Summary.

From the above we find the following daily saving in a mill with two sets of Krom's rolls, as compared with 30 stamps:

Weir and tearand repairs.....	\$10 55
Interest and amortization.....	4 65
Fuel, two cords of wood, at \$6.....	12 00
Total.....	\$27 20

If no great accuracy can be claimed for this estimate, it is the best which can be given at present, and it is sufficiently correct to prove the economy of rolls beyond any doubt.

Mr. Krom and Mr. Clark claim a much greater saving in favor of rolls than that stated above. The future will demonstrate the correctness or fallacy of this view.

Even if we consider two sets of rolls equal in capacity to only 20 stamps, there still remains a considerable margin in favor of rolls.

The Chloridizing Roasting of the Ore.

The reverberatory furnace has universally been superseded by mechanical furnaces. Of these three types are in use:

- (1.) Revolving cylinder furnaces, which roast a charge.
- (2.) Inclined revolving cylinder furnaces, working continuously.
- (3.) Shap furnaces, which roast the ore as it falls through a beated chamber.

Mr. William Brueckner is the inventor of the first type. The first experimental Brueckner furnace was erected at San Francisco, Cal., in 1864. In the year 1867 it was introduced in the silver mills of Georgetown, Colo. The construction of this furnace has since then been more or less modified, the most marked change being that carried out by Mr. O. Hofmann, at the Silver King mill, Arizona, by providing the cylinder with a fire-place at each end.

The Stetefeldt furnace, the only successful representative of the third type, was introduced in 1869 at the Auburn mill, near Reno, Nev. It has been much improved in details of construction. Its imitations were in no instance improvements of the original, and had only a short-lived existence. The second type of furnaces, although they originate from the White furnace, an older patent than that of Stetefeldt, did not occupy a prominent place until after the Stetefeldt furnace had been largely introduced, and Mr. Howell had combined the White cylinder with the auxiliary fire-place for roasting the dust, one of the principal features of the Stetefeldt furnace. The first Howell furnace was built in 1872 at the Citizen's mill, Austin, Nev. Later on the construction of this type without the auxiliary fire-place found again a few advocates, and new names were invented—for instance, the "Oxland." That such furnaces are decidedly inferior, because they effect a very incomplete chlorination of the dust, is acknowledged by professional metallurgists.

I cannot notice here the great number of inventions which either are recorded only in the Patent Office or had a mere ephemeral existence, or, like the O'Hara furnace, never played an appreciable part in the production of silver bullion. These furnaces perform their operations more or less satisfactorily, much depending upon the skill of their management. All of them effect a great saving in the expense of roasting as compared with the reverberatory furnace. For mills of small capacity the Brueckner furnace is to be recommended. In mills of large capacity the other types work cheaper, especially as far as fuel is concerned. The Stetefeldt furnace excels on account of its durability and large capacity, and in that the power required to run it is merely nominal. It has been adopted in the best constructed and most successful mills of Nevada, Utah and Montana.

Two processes only are practiced for the extraction of silver from roasted ores, namely, amalgamation and lixiviation by hyposulphite solutions.

Amalgamation.

I have already stated that the use of the pan for amalgamation of roasted ores is characteristic of American silver mills, the barrel process becoming soon obsolete. The long time necessary to complete the amalgamation, and the greater delicacy required in the manipulation of the process, were the principal reasons which drove the barrel out of the field. The foundries, no doubt, had also a large share in the introduction of the pan, which was more profitable to their pockets. Regarding the construction of the pan it soon became evident that all complicated designs were of no merit, and the so-called "combination pan" was generally adopted. In the settler system comparatively little progress has been made, and it is here where most of the quicksilver is lost. The Boss system of elevating quicksilver or the bucket elevator is found in every well-appointed mill. The retorting of the amalgam is still done in the old way, a new system, introduced at the Lexington mill, Montana, namely, retorting with a current of air and suction, has not given such favorable results as were expected. In conducting the process of amalgamation itself no important change has taken place. The reduction of the silver chloride by granulated zinc, or rather zinc amalgam, although excellent in results, has found its way into a few mills only. For melting retorted bullion into bars the Lexington mill is the first one which has successfully introduced a reverberatory furnace for that purpose. At the Manhattan mill, Aus-

tin, Nev., reverberatory furnace melting had again been abandoned.

Lixiviation With Hyposulphite Solutions.

The lixiviation process with hyposulphite solutions is now entering into serious competition with amalgamation. It was first introduced in the United States in 1874, at Melrose, Cal., by the late Mr. G. Knestel. Subsequently lixiviation works were erected at Galena, Nev., at Monitor, Cal., and at the Martin White mill, Nev. All these establishments were on a small scale and their existence was of short duration. The first successful introduction, on a large scale, was at the Silver King mill, Arizona, by Mr. O. Hofmann, in 1880. The next mill with lixiviation plant was the Bertrand, built at Geddes, Nev., in 1882, followed by the Mount Cory mill, Nevada, in 1883. So much interest is manifested in the lixiviation process, and such radical improvements have recently been made in it by E. H. Russell, that a brief discussion of the subject will not be out of place. Those who wish more detailed information I will have to refer to a paper which is to appear in the transactions of the American Institute of Mining Engineers.

In the lixiviation of silver ores by means of a hyposulphite solution, two difficulties have heretofore been met with, which have rendered the process inapplicable in many cases: (1) The difficulty of producing bullion free from lead; (2) the necessity of a very perfect chloridizing roasting, since the hyposulphite solution acts only imperfectly upon metallic silver, and such of its combinations which have not been transformed into the chloride by the roasting process. In the amalgamation of roasted silver ores, bullion almost entirely free from lead is produced, if certain precautions are taken, even in case the ore contains a large percentage of lead minerals. If native silver occurs in the ore which is not entirely converted into chloride by roasting, this silver amalgamates readily. Silver compounds, too, which are not converted into chloride, are decomposed, to a certain extent, and the silver is amalgamated, especially if the roasted ore contains soluble copper salts. Hence a larger percentage of silver is, in many cases, extracted by amalgamation than that shown to be present as chloride, according to the customary chlorination tests. Mr. Russell's improvements in lixiviation consist:

1. In a practical and cheap method of precipitating the lead by itself from the hyposulphite solution.

2. In the application of a solution containing a double salt of sodic and cuprous hyposulphite, which reacts upon and dissolves silver compounds not soluble in sodium or calcium hyposulphite. He calls this solution the "extra-solution," to distinguish it from the ordinary sodium hyposulphite solution without copper.

Separation of Lead From a Hyposulphite Solution Containing Copper and Silver.

Mr. Russell discovered that lead can be completely precipitated from a hyposulphite solution by sodium carbonate as lead carbonate, while silver and copper remain in solution. In working on a large scale the commercial soda ash is used for this purpose. An extra series of precipitating tanks has to be provided. The lead carbonate settles quickly, and the clear solution is decanted into the silver precipitating tanks, where copper and silver are precipitated by sodium sulphide. The lead carbonate is collected and sold to smelting works.

The Treatment of the Ore by the Extra Solution.

If to a solution of sodium hyposulphite copper sulphate is added in the proportion of two of the former to one of the latter, the reagents completely decompose each other, a double salt of sodic and cuprous hyposulphite being formed. In case concentrated solutions have been used this double salt is precipitated as a canary-yellow powder. It is not easily soluble in water, but dissolves readily in a sodium hyposulphite solution of two per cent concentration. A solution of this double salt exerts a most energetic decomposing and dissolving action upon metallic silver, silver sulphide and combinations of silver with antimony and arsenic. If a charge of roasted ore is first treated with an ordinary hyposulphite solution to extract the silver chloride, and subsequently with extra solution, an additional amount of silver is extracted, which, by using the old method only, would have been lost in the tailings. Experiments carried out at the Ontario mill, Utah, show, with well chloridized ores, a difference of 4½ per cent in favor of Russell's process, and from 2 to 3 per cent more silver extracted than by amalgamation. But with ores of low chlorination the difference may arise above 30 per cent in favor of the extra solution. In applying the extra solution it is used for several charges in succession before the silver is precipitated from it, together with copper, by sodium sulphide.

Improved Process for Treating the Sulphides.

It cannot be denied that the handling of the sulphides is a weak point in the lixiviation process. In roasting such rich products a mechanical loss, and a loss in silver by volatilization cannot be avoided. The by-product of rich copper matte, obtained in melting the roasted sulphides, is also undesirable. The following process is designed to obviate existing difficulties. The sulphides are dissolved, without previous drying, in sulphuric acid, with addition of niter. After complete decomposition has

taken place the silver is precipitated from the solution by metallic copper. From the copper solution copper sulphate is obtained by evaporation and crystallization. A great saving in niter can be effected if the nitric oxide escaping in this process is, according to well-known chemical reactions, reconverted into nitric and nitrous acid, which are absorbed by sulphuric acid. This nitrated acid is then used for oxidizing fresh charges of sulphides.

Amalgamation and Lixiviation by Russell's Process Compared.

Without entering into detailed calculations, I will only point out the principal items which are in favor of lixiviation, as compared with amalgamation.

1. In amalgamation the fineness to which ore has to be crushed is determined by the capacity of the settler to work off coarse sands without material loss of quicksilver. It is not practicable to use a coarser screen than No. 30, if the crushing is done by stamps. This is almost equivalent to sifting through a No. 40 revolving screen, if the crushing is done by rolls. In lixiviation pulverizing as coarse as possible is desirable. The limit of coarseness is determined by the roasting process. It depends upon the character of the ore, and principally upon the manner in which the silver-bearing minerals are disseminated in the gangue.

2. The original cost of the lixiviation plant is much lower than that of pans and settlers. A farther saving is effected by a reduction in size of the engines and boilers, the power required for pumping solutions, etc., being merely nominal.

3. In amalgamation the pans and settlers consume not less than 1½ horse-power per 24 hours for each ton of ore.

4. In large mills the quantity of quicksilver in rotation represents a capital of from \$30,000 to \$40,000, while the stock of chemicals required for lixiviation does not cost more than one-tenth of this amount.

5. With Russell's improvements the percentage of silver extracted is much higher than by amalgamation.

6. Lixiviation by Russell's process requires a less careful chloridizing roasting. That in some cases salt may be entirely dispensed with is indicated by experiments made at the Ontario mill.

7. The value of the lost quicksilver, and cost in wear and tear of the pans and settlers, amounts to more than that of the chemicals consumed in the lixiviation process.

8. The lixiviation process permits the extraction of copper and lead as valuable by-products.

9. The sulphides from the lixiviation process can be much easier converted into fine bars than the bullion obtained in amalgamation.

10. Amalgamation is invariably injurious to the laborer's health.

In view of these advantages, coupled with a reduction of the cost in crushing by using rolls in place of stamps, we stand before a revolution in the reduction of silver ores, to which this process can be applied, rarely equalled in the history of metallurgy. It is fair to presume that in lixiviation mills of large capacity, with rolls, the cost of producing silver will be lessened nearly one-half, as compared with the present system of stamps and amalgamation, and in some cases the saving will be even greater.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

THRASHING CYLINDER.—Edward C. Souney, Sacramento. No. 322,135. These improvements consist in peculiarly arranged double bars, in novel reversible and single teeth, and the means for seating and securing together the teeth bars and heads. The object of the invention is generally to provide a practical and serviceable thrashing cylinder of great strength of parts, and adapted to be readily repaired by the easy removal of worn or broken teeth and the substitution of new ones.

STACKING MACHINE.—Byron Jackson, S. F. No. 322,106. Dated July 14, 1885. This is a machine for stacking grain. The stacker lifts the net out of the wagon and dumps the load. When unloaded the net returns to its place in the wagon, properly spread in the bed, by the action of the weight. The lifting capacity is one ton, all that the strongest pair of horses can pull. The grain is dumped on the center of the stack, making it easy for the stack builder to keep the stack in shape. The net has neither wood end-rail, latch or trip-rope, but is simply hooked at the four corners to the lifting frame.

DERRICK.—David Sharp, of Leemoore, Cal. No. 322,756. Dated July 21, 1885. The object of this invention is to supply farmers and others needing hoisting apparatus with a derrick which is simple in construction, economical, and is, above all, readily handled. It belongs to that class of derricks having a mast mounted on a wheeled frame and adapted to be raised for operation and lowered for transportation. It has a wheeled main frame, on one end of which are standards in which is mounted at an elevation a roller which may have a vertical adjustment when desired. A smaller frame is mounted on the main frame and has a sliding movement thereon by reason

of rollers on which it travels. Pivoted by a cross shaft in this sliding frame is the mast, which in being raised and lowered rests on the roller. Tackle is attached to the sliding frame to move it. As the frame moves towards the roller the mast rises to a position from which it can readily be pulled by its guys to a vertical. To lower the mast it is allowed to drop to the roller and then the sliding frame is moved back, so that the mast moves to a slight angle with the horizontal and there rests. There is also a peculiar connection between the outer end of the boom and the top of the mast for moving the former to any desired position.

BELT-WINDER FOR THRASHING ENGINES.—Perry Olmsted, Dixon. No. 321,521. Dated July 7, 1885. This invention relates to a new and useful belt-winder attached to the side of a thrashing machine, the object of which is to receive and wind up the main driving-belt after its use is discontinued. This belt is usually very heavy. It is usually rolled up by hand, the operator removing it from both pulleys and rolling it upon the ground before putting it away. In some cases a small windlass is used. Mr. Olmsted's plan provides for a simple and ready adjustment of the belt on the windlass, said windlass being secured to the side of the thrasher.

BRAKE BLOCK HOLDER.—Duskin Hedrick, Greenville, Cal. No. 322,099. Dated July 14, 1885. This invention relates to that class of brake block holders in which clamping jaws are employed to receive the block to the bar; and the invention consists of peculiarly pivoted jaws on the brake bar adapted to clamp the block, the sides of which are properly shouldered to receive said jaws, a screw mounted on and connecting the rear ends of the jaws and a nut or screw adapted to force the rear ends of the jaws in opposite directions, whereby their forward ends are forced together to clamp the block. This block can be readily removed and replaced when desired.

MANUFACTURE OF SUPERPHOSPHATE.—Frank Dikken, of San Francisco, Cal., assignor of one-half interest to Edgar J. Duhbs, of Alameda, Cal. No. 322,698. Dated July 21, 1885. This invention is for an improvement in the manufacture of superphosphate or soluble phosphate of lime. Heretofore this manufacture has been accomplished by means of the sulphuric acid of commerce. But in the process of Mr. Dikken the necessary sulphuric acid is obtained from the acid sulphate of soda. His process consists in dissolving acid sulphate of soda in water and adding to the solution a certain quantity of pulverized bone or other phosphate of lime, and then driving off the water from the solution by means of heat.

ORE FEEDER.—Joshua Hendy, of San Francisco, Cal. No. 322,716. July 21, 1885. This machine belongs to that class in which the drop of the stamp stem causes the automatic feed of the ore to the mortar. A large hopper receives and discharges the ore upon a rotating disk or table, which is mounted under its throat at an inclination. The disk or table is rotated through power transmitting devices by the action of the falling stamp. Means are provided for obviating the irregular wear of parts of the power transmitting mechanism, so that the delicacy of the feed movement will be unimpaired. Novel means are also used for returning the lever with which the collar or other device on the stamp stem comes in contact, to its point of action after each stroke of the stamp. The machine is so constructed as to control the movement of the feed table and the amount of ore fed very accurately, and to permit of the adjustment and regulation of parts to the best advantage.

EXPANDING HORSESHOE.—Charles C. Allen, of Salinas, Cal., assignor of one-half interest to N. A. Dorn, of same place. No. 322,671. July 21, 1885. This horseshoe is of that class which are pointed at the toe and adapted to expand, in order to prevent contraction of the hoof. The shoe is a two-part one. The forward ends of the two parts are pivoted to a plate on the upper side of the shoe, which is let in flush. This plate prevents sand from working up under the hoof. It also strengthens the toe joint. Under the shoe is a toe calk, to which the forward ends of the parts of the shoe are also pivoted. The presence of both toe calk and sand plate provides for a strong and durable joint. A perfect shoe is thus made, adapted to expand and to prevent the entrance of sand.

PNEUMATIC DOOR CHECK.—Geo. Vincent, of Stockton, Cal., assignor of one-half interest to George W. Hainee, of same place. No. 322,763. Dated July 21, 1885. This is a door check of that class in which the compression of air prevents the door from slamming. It consists of a cylinder having its rear end open and pivoted to a bracket on the door casing. A piston works within the cylinder, and its rod extends out through a peculiar air-tight packing in the front end and is secured to a bracket on the door. There is a cup-leather on the front side of the cylinder, forming air-tight joints. The check is applied to doors having a closing spring, and as the door closes the piston moves forward, encountering the resistance of the air in front, which escapes slowly through a very small aperture. As the door is opened the piston in moving back offers no resistance, as the rear end of the cylinder is open,

ENGINEERING NOTES.

Steel Versus Iron Girders.

C. L. Strobel, C. E., a widely known engineer, draws the following conclusions in a paper read before the Engineers' Society of Western Pennsylvania, entitled "Experiments on Steel and Iron Riveted Girders, and Remarks on the Tests Made by the Dutch Government."

1. Each of the steel girders showed a large increase in strength over the iron girder; the soft steel girder proved 22 per cent stronger, and the hard steel girders 66 per cent stronger than the iron girder.

2. The greater strength of the soft steel over the iron in the specimens was fully attained, and exceeded, in the girders.

3. The hard steel girders did not show so large percentage of greater strength over the iron girder as did this material in the specimens. This may be accounted as the result of punched holes which gave way by the fracture of the tension flange, whereas the girder with reamed holes gave way in the compression flange and probably would have stood more before fracture had taken place in tension flange. The latter girder did not appear to bear truly upon its supports, and it was probably this which caused it to fall in top flange when it did.

4. Punching rivet holes without reaming did not produce any result other than an apparent loss of strength, as compared with reamed holes.

5. The strength of steel girders strained in the manner of these girders appeared about the same for the two flanges, if made alike in section.

THE MERSEY RAILWAY.—The whole length of the tunnel under the river Mersey, which is 1,300 yards from quay to quay, is now reached in, and the greater part of the land approaches are finished, so that the laying of the permanent way will shortly commence. The total length of the line will be four and a half miles, independent of some extensions now being proposed. It runs from the London and North-western and Great Western joint lines at Birkenhead to the Central Station at Liverpool, the course being chiefly under the public streets in the land portion. The underground parts of the stations at Greenlane, Traimere, and Hamilton Square, Birkenhead, with that at James street, Liverpool, are in a forward state. The hydraulic machinery for lifting train loads of passengers, the machinery for mechanical ventilation, and the locomotives and carriages are in course of manufacture. It is expected that this railway will cost half the mileage rate of the Metropolitan Railway, and that the main line of three miles will be opened about June next.

CAST-IRON COLUMNS AS MAIN SUPPORTS.—The employment of cast-iron columns as main supports has been greatly restricted at Berlin by a regulation issued recently from the architects' department of the police authorities of that city, causing great consternation among builders. The cause of the new order is said to have been a discovery in connection with a fire last winter in the Alte-Jacobstrasse, when it was found that the cast-iron columns had been cracked by the effect of the cold water jet playing upon them so that the upper stories of the house were as near collapsing as they could possibly be. The Berlin police authorities insist upon it that where partition walls rest upon columns the latter are either to be bricked in or covered with a patent plastering in such a manner that an air space remains between the iron and the brick or plastering. In many cases a brick pier or granite pillars are prescribed.

THE SHIP CANAL ACROSS IRELAND.—The official surveys, plans, and sections of the Anglo-American Ship Canal from Kingston harbor to Galway bay, have been completed by the surveying and engineering staff, and submitted to a conference of some of the most eminent engineers of this and foreign countries. The plans and sections fill two ponderous volumes four feet square, and seem to be elaborately prepared. The undertaking is said to be powerfully supported, as obviating the chief hazards of trans-Atlantic navigation between England and America, besides the enormous advantages it will confer upon Ireland, several stations along its line forming entrepôts for direct trade with America on one hand, and England on the other.

THE LONGEST DRAW-SPAN KNOWN.—The Passaic Rolling Mill and Bridge Works, of Paterson, are building what will be, when finished, the longest draw-span in the world. It is to be 430 feet long, will weigh about 500 tons and consist of iron and steel in the proportion of three to two. The machinery for latching, lifting the ends and turning the draw is all to be worked from the center of the span, and is fitted to be operated by either hand or power. The turn-table is rim-bearing, turning on 50 wheels 18 inches in diameter.

THE NEW FORTH BRIDGE, between North and South Queensferry, Scotland, approaches completion. It is a cantilever structure, 8,091 feet long, 150 feet high, and will cost \$8,000,000. It has been nearly eight years in building. Two thousand men are now employed upon it.

USEFUL INFORMATION.

GEOGRAPHY IN 1738.—Some one recently furnished the *Morning Call* with the following description of America, as given in an old geography: Looking at an old geography printed in 1738, I read that "California, the largest island in America, lies along the coast of New Mexico, southward. The Spaniards have there several harbours, and upon the coast there is a Pearl Fishery. The natives are of a much less savage nature than one would imagine; their wealth consists of cattle, which serve them for most of the conveniences of life; of the call's skin they make pales."

"America, called the West Indies, is about twice as large as Europe, and Nature itself made the division of it, by the Isthmus of Panama, into North and South America. North America is divided into four Capital parts, New Spain, New Mexico, Florida and Canada; New Spain, lying under the Torrid Zone, and of which the Spaniards made themselves masters in 1521, after a cruel massacre of some millions of the Natives."

"New Mexico lies north of Spain, east of the island of California, and joins Quivira Anau and the unknown lands toward the North Pole."

"Florida, divided by the river Mississippi, was called Jaquaza before the Spaniards discovered it. Mexico is the capital city of all America."

"St. Fe, a fine city built of stone by the Spaniards, where live about 680 of them, who are masters of 50,000 slaves, all Natives; Cibola or Granada-Nouvelle, a place of commerce; Finqueze, a college of Jesuits, and Acoma, a small but well-peopled place."

TANNING FIBROUS MATERIAL.—A Belgian inventor, M. Piron, has invented a method of rendering cellulose tissues, such as linen and cotton cloth, impervious and very durable without injuring their flexibility, and without much increasing their weight. By examining the bandages of the Egyptian mummies he inferred that the best preservatives would be found in the vegetable kingdom, and he has given preference to the green tar of birch bark, which furnishes the perfums of Russian leather. The tar forms, with alcohol, a solution of great fluidity, but when once dried it becomes resinous and resists the solvent power of alcohol. It can be combined with the most brilliant colors. These qualities enable it to penetrate the capillary vessels of tissues, covering them with a varnish of great elasticity, which resists the corrosive action of acids, sea-water and changes of temperature. The density is very small, so that the tissues are made impervious with a slight increase of weight. The prepared stuffs can be folded without scaling. The aromatic odor drives away insects. Microscopic vegetation cannot grow, because neither air nor water can penetrate into the interior of the fibers. The invention can be applied to all vegetable tissues, such as sail-cloths, cordage, awnings, curtains, etc.

CLOTHES LINES WET AND DRY.—Some one writes to a contemporary under the head of "Facts Whittled Down" as follows, on the subject of clothes lines: I would state that I have often noticed their tightening when thoroughly wet, as well as the same line becoming too slack when again dry, and I have wondered what the action could be that produced this change. Sometimes I have thought it might be a felting process, as in wool, causing contraction. In fact, the decision of all is, no doubt, that the line expands and contracts as it becomes wet or dry, and the subject left there; but the question is, what makes it expand and contract? My theory is this: A clothes line has about three turns of twist per inch; when it becomes wet the fiber swells, and a wet rope is larger than a dry one; hence, it must be shorter with the same amount of twist, bringing the twist nearer to a right angle.

TESTING GOLD AND SILVER.—For testing gold, make a liquid consisting of nitric acid one ounce, water two drams and muriatic acid one-half scruple. Mix the ingredients well and keep the solution in a bottle with a glass stopper. With a glass rod which has been dipped in the mixture touch the metal and watch the action. If no effect is produced on the metal, it is either gold or gold-plated. If the gold is very low, or less than nine karat, the acid will boil green, and base metal is at once detected by the mark left by this acid. To test silver, apply a drop of a solution of nitric acid, three ounces, water one ounce and bichromate of potash one-half ounce, and wipe off the drop immediately with a sponge and water. If a blood-red mark results, the metal is silver or the article silver-plated.

THE METALS IN SHIP-BUILDING.—Some idea of the large amount of iron and copper, etc., which enters into the construction of a ship may be formed by reading the following paragraph: The old war ship *Niagara*, recently broken up at the Charleston Navy Yard, yields 171,226 pounds of copper, 61,369 pounds of composition, 486 pounds of wrought iron, 646,000 pounds cast-iron, and 18,000 pounds lead.

ROPE FROM ASBESTOS.—The manufacture of rope from asbestos is likely to become an industry of considerable importance in England, the strength of the article being estimated at about one-fourth that of ordinary hemp rope of the same diameter. Ropes of this material of one

and a half inches in diameter is stated to have a breaking strength of one ton, and 20 feet of it are calculated to represent a weight of 134 pounds. Some of the purposes as enumerated, to which this kind of rope is especially adapted, are theaters, fire brigades and means of escape from dwellings and public buildings, its advantages being that it will not break and drop its burden if the flame bear upon it. It is made like ordinary rope, and is spun from Italian asbestos thread.

A NOVEL METHOD FOR CUTTING GLASS TUBES.—Electricity has now been applied for cutting glass tubes—an operation of some difficulty when the diameter is large. The *Journal of the Society of Arts* says: An iron wire $\frac{1}{16}$ in. in diameter is wound round the tube at the place required to be cut, and the ends are connected by means of copper conductors of the same diameter with the poles of a powerful battery or other generator of electricity. This iron becomes heated when the current flows, and is only necessary to cool it suddenly with a few drops of cold water in order to produce a clear cut. Glass tubes four inches in diameter are now cut in this way.

A STEEL TEMPERING PROCESS practiced by M. P. Gabriol is said to give very desirable and satisfactory results. Cyanide of potassium is dissolved and red heated in a metallic or earthen crucible, and the pieces of steel are then immersed in the liquid until they are red and afterward plunged into cold water. It is asserted that this method of tempering does not distort or bend a straight piece, and proves very serviceable in dealing with escapement springs.

TO KEEP SILVER PLATED ARTICLES BRIGHT.—This can be done by dipping the articles occasionally in a solution of hyposulphide of soda. Large articles, like pitchers and salvers, should be wiped off with a rag dipped in the solution and dried with a soft towel. By rubbing with a piece of chamois leather they will be as bright as new.

THE moss crop of Florida, says the *Pensacola Commercial*, is worth more than the cotton crop, and can be put on the market at less expense. The demand exceeds the supply, and there is not a county in which this product is not going to waste.

JAPANESE industries are mostly conducted in small workshops, with possibly the aid of a primitive water-wheel; fan-making and the manufacture of porcelain, paper, pigments and lacquers, constituting a large portion of the whole.

TEMPERED COPPER.—A tomahawk of tempered copper was recently found by a farmer near Sanborn, Dakota. This is a very rare relic. The method of tempering copper tools is said to be a lost art.

CARPETS, after the dust has been beaten out, may be brightened by scattering upon them cornmeal mixed with salt, and then sweeping it off. Mix salt and meal in equal proportions.

GOOD HEALTH.

Mullein Leaves in Consumption.

There are many of our readers, doubtless, who will remember how much in their early days they were impressed by their mothers and grandmothers in regard to the medicinal value of the mullein leaf, so common in the poor pastures of their New England homes. All such will read with interest the following:

Mullein Leaves in Consumption.

Dr. Quinlan, of Dublin, read before the International Medical Congress at Copenhagen last year an interesting paper on the medicinal qualities of the mullein. It has attracted widespread attention, and among the more recent articles confirmatory of Dr. Quinlan's statements is one by Dr. Wilfert, of Cincinnati, which appears in the last number of the *Lancet and Clinic* of that city. From the results obtained in 127 cases of pulmonary consumption treated by Dr. Quinlan with mullein alone, he draws the following conclusions, which are condensed from his original article, viz:

1. In the earlier and pre-tubercular stage of pulmonary consumption, mullein has a weight-increasing and curative power greater than that of cod liver oil, and equal to that of Russian koumiss.

2. In cases where tubercles are well established or cavities exist, the mullein has great power in relieving cough—a great boon to consumptives, whose weak stomachs too frequently cannot tolerate the usual cough remedies.

3. Phthisical diarrhoea is completely obviated by this mullein.

4. Mullein has no power or effect on the night sweats of consumption, which should be combated by atropia sulphate.

The method of using the mullein, which originated among the Irish peasantry, and was adopted by Dr. Quinlan just as he found it, is as follows: Three ounces of the fresh green leaves, or about 10 times that much of the dried, are boiled in a pint of fresh cow's milk. After boiling a moment the infusion is allowed to stand and "steep" for 10 minutes, when it is strained, sweetened and drunk while warm. This quantity is taken twice or three times a day. It is generally much relished by the pa-

tients, who regard it as a pleasant article of diet, rather than as a medicine. The smoke of the mullein leaves inhaled into the respiratory passages relieves irritation and spasmodic cough.

Dr. Wilfert states that he has followed Dr. Quinlan's method in 20 cases of undoubted pulmonary phthisis, all of them more or less advanced, and all improved during the administration of mullein, no other drugs being used. These results are certainly very encouraging and should be followed up.

WORKING AND SLEEPING.—Some men are blessed with a working constitution. They may not be of stalwart frame, nor even enjoy robust health; but they can work day after day, continuously, and endure without flagging fatigue of body and strain of mind. Such men are usually good sleepers, and in this way nature recreates them. Lord Brougham was one of this class, being equally good as a worker and a sleeper. His power of sustained mental labor was something wonderful. In the early days of the *Edinburgh Review*, when he was one of the most frequent contributors, it was a common feat for him to read a book one day, and to write an elaborate article on it the next. Many a time he worked 12 hours on a stretch at his desk, and often he included this night as well as the day in his stint. The greatest feat of his life seems almost impossible, but intimate friends vouched for its absolute truth. He had one week several important cases in court, for which he had not made full preparation. He was busy in the court room by day during the week, and spent the nights in preparing his arguments. On Friday afternoon the cases ended. He hurried to his country seat, ate a hearty dinner and slept through the entire days and nights of Saturday and Sunday, and awoke on Monday morning, thoroughly rested, ready for another week's hard work. He suffered, however, the penalty of such irregular habits. They so disordered his nervous system that he was an uncomfortable companion, even to his best friends, while those who were not intimate with him found him a tyrant.

TEA AS A BEVERAGE.—Wong Ching Foo in the *Cook* says: "Use a china or porcelain pot. If you do use metal let it be tin, new, bright and clean; never use it when the tin is worn out and the iron exposed. If you do you are playing chemist, and forming a tannate or tea-ate of iron. Use black tea. Green tea when good is kept at home. What goes abroad is bad, very bad, and horrible. Besides containing the 203 adulterations the Chinese philanthropist puts up for the outside barbarian, it is always pervaded by copper dust from the dirty curing pans of the growers. Infuse your tea. Don't boil it! Place one teaspoonful of tea in the pot and pour over it one and a half cups of boiling water—that is, water really boiling. If your tea is poor use more. It is cheaper, though, to buy good tea at the outset. Put your pot on the back part of the stove, carefully covered, so that it shall not lose its heat and the tea its bouquet. Let the tea remain there five minutes. Then drink it. Drink your tea plain. Don't add milk nor sugar. Tea brokers and tea tasters never do; epicures never do; the Chinese never do. Milk contains fibrin, albumen or some other such stuff and tea a delicate amount of tannin. Mixing the two makes the liquid turbid. This turbidity, if I remember this cyclopaedia aright, is tannate of fibrin or leather. People who put milk in tea are therefore drinking boots and shoes in mild disguise."

TREATMENT OF A FELON.—A correspondent of the *Michigan Farmer* says: "I wish to tell those who may suffer from that terrible scourge, felons, of a painless remedy that will effect a perfect cure in 24 hours, as I have had occasion to prove within the last 3 days. A lady came here who had been suffering over 2 weeks with a felon on the end of her middle finger. I saturated a piece of wild turnip, the size of a bean, with spirits of turpentine and applied it to the affected part. It relieved the pain at once. In 12 hours there was a hole in the bone, and the felon was destroyed. I removed the turnip and applied healing salve, and the finger is well."

PURE FOOD.—M. Pasteur recently recommended a member of the Academy of Sciences to experiment with young animals in order to ascertain if they can be nourished upon the absolutely pure food which many people regard as an ideal diet—that is, food wholly free from microbes. He believed that such a diet would not sustain life, and that the presence of common microbes in the digestive organs was necessary to the proper functional action of those organs.

SINKING AT THE STOMACH.—Individuals sometimes complain of a very unpleasant sensation at the pit of the stomach, as if "the bottom had dropped out." The feeling is commonly due to the improper use of the breathing apparatus. The abdominal and dorsal muscles have become relaxed, and the diaphragm has been forced to do more than its share of work. The remedy is fresh air and exercise.

CHLORINE AND GERM DISEASES.—Workers in bleacheries where chlorine is largely used are singularly exempt from all germ diseases, but suffer from special ailments induced by inhaling that gas.

FOR NOSE BLEEDING try bathing the face and neck in cold water.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENERAL MINING ITEMS.—*Sentinel*, Aug. 1: The mill at the Amador Queen mine is crushing when water can be obtained. The prospects of this mine would appear to be most flattering. The St. Julian mine continues to look well, though the mill is tied up at present for lack of water. Reports from the McKinney mine at Middle Bar, continue favorable, the rich rock being found in yet larger quantities. There is a rumor that the Tellurium mine of Pine Grove will soon be started up by Capt. Roberts, of Sacramento. Rich rock is now being taken from the Crockett mine, near the West Point bridge. The derrick in use at the Lambing gravel mine for hoisting the top dirt is one of large dimensions. Length of boom 114 feet, 46 feet wide. The derrick car is 44 feet long by 16 wide.

Calaveras.

ABOUT ANGEL'S CAMP.—*Mountain Echo*, July 29: Owing to lack of water, the North End has suspended operations for the present. W. Evans, of this town crushed in an arastra four tons of ore taken from this mine, recently, from which he realized \$58, an aggregate of \$17 per ton. Steam power is soon to be erected at the Lane mine, which is now run by water-power. A portion of the machinery has already arrived. This arrangement will enable the company to keep the mill running steadily, as when the water supply is short steam can be used. It is the impression that there will be a big mining boom in Carson before long. Twenty more stamps are soon to be put in the Brechtel mine, making in all thirty. The cleanup there the other day was quite satisfactory. The mine is paying well. The Colier mine, situated five miles east of Murphys, on the north side of the Stanislaus river, has been bonded by Messrs. Geo. Seitz and C. H. Ross for one year. There is a tunnel 200 feet long on the premises, and 55 feet from the mouth of this tunnel they are sinking a winze which is 18 feet at present, and it is their intention to sink it to a depth of 208 feet where they will tap it by another tunnel at the base of the hill. Three assays have been taken from the rock, and it gives the following returns: No. 1—\$1,941, No. 2—\$444, No. 3—\$325 50 per ton. The facilities are all excellent for working, and some very rich specimens are being exhibited.

Colusa.

SULPHUR CREEK.—*Lower Lake Bulletin*, Aug. 1: The gold mines at Sulphur Creek are doing a flourishing business. The old Manzanita and Cherry mines have been purchased by a San Francisco company, and are yielding remuneratively. The rich but rebellious ores of Sulphur Creek, with which nothing could be done, are yielding well, handled by the Wiswell Pulverizer and Amalgamator. The machine is considered a great success.

Inyo.

CERRO GORDO.—*Independent*, August 1: Business is likely soon to undergo a revival at this place. It is well known that there is plenty of good ore in the old camp, and the legal troubles that hindered the working of the mines are nearly all ended now. It is an open secret that a large number of men will be put to work in some of the mines, perhaps a larger number than at any former time. In addition to this, recent experiments have proven that the vast quantities of low grade ores, formerly regarded as worthless, can now all be worked at a good profit. This fact alone insures prosperity for Cerro Gordo, and for the country as well. A few more months will prove, what some never doubted, that the railroad was the most valuable aid to the development of mining resources ever brought to the country, and with the development of mines the promotion of every other interest.

Kern.

THE BIG BLUE MINE.—*Californian*, July 29: It would appear that work has already begun at Kernville, an English company having undertaken to work the Big Blue mine at that place. It is to be hoped that this mine can be made to pay, as formerly, when it made business lively and a good market for farmers in that part of the country.

Mariposa.

ABOUT COULTERVILLE.—*Gazette*, Aug. 1: The company working the Hasloe mine have got the water out of the mine and have commenced sinking the main shaft. Their new mill is completed and ready for crushing or grinding ore as it comes from the mine. They have a strong force of miners at work. If the new mill proves a success you may listen for big results from that mine. The Bandierita people are working a considerable force in the mine. There is a considerable amount of prospecting going on, and quite a number of promising veins have been discovered recently. The Mt. Gaines mines are being pumped out and put in condition for working.

Mono.

BODIE MINES.—*Free Press*, August 1: Con. Pacific, during past week have completed winze station, and Winze No. 1 has been sunk six feet.

MONO.—The joint cross-cut on the 400-foot level extended during the week 14 feet. Five miners and one engineer employed.

THE BODIE CON.—On the 700-foot level east crosscut extended 18 feet during week. South drift on same level extended 14 feet. Upraise from the 300-foot level is up 55 feet, a gain of seven feet. The east drift from north drift, between 300 and 400-foot levels, is in seven feet. Men employed, 23.

THE STANDARD CON.—During week north drift, 410-foot level, advanced 15 feet. East drift, same level, eight feet. Drift on 400-foot level, 18 feet. Upraise on 400-foot level, 13 feet. Drift on same, 12 feet. Drift on 560-foot level, 19 feet. Crosscut on 400-foot level advanced seven feet. Number of men employed: Miners, 43; stationmen, 2; timbermen, 1; carmen, 6—at \$4 per day; laborers, 41—at \$3 75 per day; engineers, 2; shiftboss, 2; carpenter, 1; blacksmith, 1; pumpman, 1. Mine looking well. Ore shipped to mill 501 tons. The Bodie Tunnel Company has built two dams above the mill, and now has plenty of water for milling purposes—quite a saving over previous methods.

ABOUT BENTON.—West of the Laura, James Goyen has located a ledge, and is opening it up by tunnel. In several places it shows a nice slab of good ore. Still west, W. R. Ritchie has started in on a ledge with good prospects, and further down the hill Wm. Beckman and John Krenshaw have been working a very promising location, carrying occasional bunches of rich lead and black ores. Several parties came down from Bodie last week, and went out to Clover Patch to work assessments on several of the claims out there.

Nevada.

QUARTZ MINES IN EUREKA TOWNSHIP.—Near Moore's Flat, Mr. Buck has been opening up a vein of rich rock, and parties versed in such matters pronounce it a valuable mine. In the near future there will no doubt be a mill on the ground. Hathaway & Davis are also prospecting in that vicinity and meeting with encouragement. Copper and partner are taking out some rich rock, keeping up expenses of development by running a small hand mortar. Next in order is the Santa Anita mine which has a mill on it, but is not running at present. The owners intend to resume operations soon. Close by is the Spanish mine which has two Huntington mills. Here is found a peculiar formation, but it pays well. In this vicinity is the "Old Grizzly" mine, formerly owned by an Eastern company, but badly managed. The machinery was taken off and the mine abandoned. After lying idle many years, parties from San Francisco are about to reopen it and do what should have been done in the first place, sink on the pay chute and give it a fair trial.

WILL BRING IN WATER.—*Transcript*, August 4: There is a probability that the project of bringing water power to the Empire and other mines in the district will be revived, as some of the obstacles to the right of way for a pipe-line have been removed.

GOLD SLIDE DRIFT MINE.—Messrs. Way and Williams, who are about to prospect the Gold Slide gravel claim near the Central House, have their buildings and wagon roads completed, and will start the tunnel next Monday.

A SHORT-SIGHTED POLICY.—A few years since the Republic mine, also in this neighborhood, was sold by Mr. Snapp to Messrs. Meek, Dyer, Hinckley & Co., wealthy residents of Alameda county, who put up a first-class twenty stamp mill upon it, run by water power. After three or four short runs (the rock paying about three dollars per ton on an average), they became completely discouraged and shut down. Almost the entire hill is one mass of easily worked quartz containing free gold. The claim has splendid water power and every facility for mining and milling rock at a few cents per ton. After paying out \$75,000 for mine, mill and improvements, then testing a few hundred tons of rock which did not come up to their over-sanguine expectations, these gentlemen abandoned the mine entertaining very hard feelings toward the man who sold it to them, all of which was hasty and ill-advised. This is not the way business is done on fine farms in Alameda county nor in sugar refineries or other industrial establishments there. The property no doubt is a fairly good one, and properly managed would pay a profit. Adjoining the Republic mine is the National, out of which rock was taken over twenty years ago, that milled \$11 a ton. Both the Republic and the National are lying idle, covered by U. S. patents.

WASHINGTON TOWNSHIP.—Accounts from this section of the county continue to be of the most favorable kind, the mines that are being worked paying well, and those in course of development showing the most encouraging prospects. Although operations are being conducted in a quiet way, the district has a bright future before it. An expert sent up to Washington not long since to examine the quartz mines there, though very reticent while on the spot, is understood to have entertained a high opinion of such of them as he examined, and so reported to those in whose interests he was acting. We think a good deal of money will be invested there on California account the coming autumn.

Napa.

WORKING THE SILVER MINES.—*Register*, Aug. 1: A good deal of prospecting and mining for silver ore is now in progress about Mt. St. Helena and in the vicinity of Calistoga. There are over one hundred claims located in that vicinity, and the Grigsby & Johnson mine has 600 tons of ore that will go \$100 to the ton on its dump.

Placer.

ABOUT FOREST HILLS.—*Argus*, Aug. 1: The Washington Company, have bonded a claim from A. Clark, lying between the Washington shaft and the Grinnell claims, and this week commenced a tunnel, running in from the Breece & Wheeler tunnel, at a point about 1,700 feet from its mouth, through which they expect to work the channel. The Mayflower Mining Company is negotiating for the purchase of more mining ground, lying immediately south of their present claim. The Excelsior Mining Company has bought some additional ground from the railroad company, and propose to put on a force of men as soon as they can get the water out of their old works. Breece & Wheeler are taking out rich gravel from their drift mine at Bath.

Siskiyou.

MINING JOTS.—*Union*, Aug. 1: All of the hydraulic claims on the Klamath are running on full time, and are said to be paying well. The Jackson & Crary mine is under full headway and paying unusually well. At the Black Bear mine there are some 25 or 30 men at work, and several new drifts are being run. At Doggett & Morrow's claim everything is in working order and the claim yielding liberally. At the Kittlewood, below the mouth of Scott river, good pay is being obtained, although bedrock has not yet been reached. At the Empire mine there have occurred two rock slides on the pump, which have been cleared out, and the claim is paying well. The Allen boys, of Quartz valley, have just crushed 36 tons of rock and will clean up this week. Forty tons of rock taken from their mine last month averaged \$35.25 per ton, and it is expected the average yield of this crushing will not fall short of the former. At the Klamath mine, on Salmon, a large quantity of good rock is finding its way to the dump, and the mill will be started as soon as water can be obtained. The quartz from this mine is low grade, and while the mill can be run by steam power, the company owning a good engine, it has been found unprofitable in the past, wood having to be hauled a considerable distance.

HAPPY CAMP.—Owing to the mild winter and consequent small deposit of snow in the mountains, water is scarce and mining is suspended in the majority of the hydraulic claims here.

GOLD ON COFFEE CREEK.—Sam Borden, of Trinity Center, tells us that Rumlert & Co., who are drifting on the east fork of Coffee creek, are taking out much coarse gold, and recently secured a piece which weighed \$280. It was round and smooth, about the size of a forefinger, and shaped like a rolling-pin. They expect to find plenty more large pieces.

San Bernardino.

CALICO DISTRICT.—*Print*, Aug. 2: Notwithstanding the cry of dull times, mining throughout Calico District is being vigorously pushed, and though we have no new strikes to report, yet we have no failures, nor are there likely to be any for years to come. Because the mines here occurred in porphyry there was a prejudice against them at first, it being feared they would not prove permanent. But experience having demonstrated that there are no good grounds for this fear, our district is coming to be regarded with more favor by capitalists, and it will not be long before we will begin to enjoy more fully the benefit of this change. Calico has shown itself to be second to no mining locality yet discovered on this coast. Our daily output of bullion is immense for the number of stamps employed, and new mills are in contemplation, some of which will be erected at an early day. Many new mines are now under bond to responsible parties, upon which the work of development will soon begin. Upon every hand is seen the cheering signs of material prosperity and advancement.

Sierra.

YOUNG AMERICA.—*Tribune*, Aug. 1: Work is being vigorously pushed on this mine. At the mill the battery frame is in position and mortars set, and H. Schussler, chief engineer of the Spring Valley Water Works, has been investigating the machinery preparatory to its starting up. At the annual meeting of the company the following officers were elected: President and treasurer, A. C. Busch; secretary, J. P. Deidesheimer, Jr.; superintendent, Oliver Saunderaus; manager and agent, Philip Deidesheimer; trustees, A. C. Busch, Wat. Hughes, C. A. Herringlake, J. Saunderaus and M. H. Mead. The Young America continues to improve under vigorous exploration, and is destined to take rank among the great mines of this State, as it has the resources and the benefit of a first-class management.

STRIKE AT ALLEGHANY.—A perfect mass of gold has been struck in the Osceola mine at Alleghany, and over \$1,000 taken out in one day. In the face of the tunnel the ledge is perfectly yellow with gold and the strike is looked upon as being a big thing. From a ten days' run with their quartz crusher, Gardner & Co., at Poker Flat, cleaned up \$1,700. The Derbec drift mine is looking splendid, and good-sized nuggets are being found almost daily. The rumor that it was soon to be closed down was unfounded. Some men who were employed in the tunnel were discharged, which gave cause for the rumor. The upper part of the mine, where most of the work is being done, never looked better than now. The mill at Butcher Ranch is about ready to run, everything being nearly completed. The rock in the mine continues to improve as the shaft goes down. A party of capitalists have been looking at the Phoenix mine up at Sierra Buttes, and, it is said, entertain a very favorable opinion of the same. It is undoubtedly a very valuable property. Mr. Forbes is putting up another of his quartz crushers, to be used within a few miles of Downieville. The longer Mr. Gardner uses the one at Poker Flat, the better he is satisfied with it, not only as a prospector, but as a permanent mill.

THE BALD MT. EXTENSION COMPANY is putting a couple of pumps in their shaft at the old Galloway Ranch. They have, for the past five summers, been using a pair of pumps left in the shaft when work on it was abandoned owing to inability to cope with the 65 inches of water that was coming in. When the company needed water for air and for washing, it put these pumps at work and raised it. These pumps have continued to raise the water required each summer, working at the bottom under from 130 to 250 feet of water. Last week, from some cause, probably the wearing out of one of the packing rings, one barrel ceased to work and only half a head of water has been raised since. The new pumps will be at work in a few days.

Shasta.

MINING ITEMS.—*Democrat*, July 29: Reid & Co.'s quartz mill on Star gulch will be running in a few days. The new shaft of the McDonald mine at Deadwood is down 125 feet. The Huntington mill near Oso will be moved to Redding in a few days and put up as a custom mill. It works ten tons per day and has sulphur concentrators attached. Spellman and Whitton's claim on Squaw creek, shows a five-foot vein with much free gold in sight. On the Central mine, old Diggings district, the length of the tunnel is 130 feet and taps the ledge at a depth of 150 feet. The Niagara Mill and Mining Company has advertised for proposals for running a bed-rock tunnel 100 feet long. The company will furnish timbers, cars and track. Bids will be received at the office of the company at French gulch up to August 5, 1885. Hon. Reuben Clark, who purchased the Harrison mine, will ship his engine and part of his quartz mill machinery here this week, and the rest of the machinery will follow in a few days after. Mr. Clark will endeavor to have the mill running not later than the middle of September. A number of new gold quartz finds are reported to have been made during the week. A young German found some very rich croppings on Rock creek near the river; Jackson, a few days ago found, near Churntown in old Diggings, a two and a half foot vein, the croppings of which are rich in sulphurets and free gold. It compares exactly with the rich ore from the Sinaloa mine, one and a half miles west of Quartz Hill. A young prospector Saturday struck a four foot vein nearly on the east side, opposite Copley. Some of the rock shown us is as fine specimens of free-gold as we have seen in the county. The mines of Shasta county continue to look favorable. Experts, capitalists, assayers and prospectors all seem to be pleased with the outlook. The indications are good for a boom, as those who are interested themselves are prepared to work the mines to advantage. All that was needed to open out these rich mines was luck, energy and capital.

The mines around Quartz hill and the old Diggings country on the east side of the Sacramento are looking splendid. Workmen on the Central are in with the tunnel 220 feet and tapped the ledge when in 150 feet. Reid & Co. will have a five-stamp steam mill in operation in a few days. The Texas mine is looking fine and keeps two arastras running. The Mammouth, one of the oldest and best paying mines in that vicinity will soon be started up again and the large mine at Quartz hill recently sold by Tom Harrison to Hon. R. Clark is paying big.

Tuolumne.

WASHING THE DUMP.—*Independent*, Aug. 1: A strike of several hundred dollars has been made in washing off the "dump" of the Anna mine in Wet Gulch, on the Stanislaus river. It is an old quartz claim, from which has been taken \$30,000 in early days, and is by no means worked out yet, as the owners have proved for the last twenty months' working on it.

VARIOUS MINES.—The Green is running night and day and doing well. The App, at Quartz Mountain, is being steadily operated, paying satisfactory dividends. A good 12 day run has just been made on the Lampher. The Jumper at Quartz Mountain recently bonded by the Fitzgerald Bros. to Edward Fisher, of San Francisco, is rapidly being put in working order, with a promising future.

Trinity.

VERMONT MINE.—*Journal*, Aug. 1: From this mine they are now taking out excellent rock; the ledge is from three to four feet in width. A quantity of the ore was sacked and taken to the Washington Mill on French Gulch, but owing to the scarcity of water, the mill is not now running and the rock will not be crushed until fall. The Vermont is splendidly located near the summit of the dividing ridge between Deadwood and French Gulch, and as development progresses will doubtless prove one among the best mines of that section.

NEVADA.

Washoe District.

COMSTOCK MINES.—*Enterprise*, Aug. 1: More and better work is being done in the mines of the Comstock at present than has been done for the last three or four years, and more men and mills are employed. Good prospecting work is going ahead in all the leading mines, and a small army of men are engaged in taking out low-grade ore in the old rich bonanza sections of both the south and north ends. There is a sort of lull, as it were, just at present in actual ore development in the deep workings of the middle mines. (Hollar has to wait and so does Savage, until the other half of the big hydraulic pump can be placed in working position before their lowest level merits can be further investigated with safety, and until crosscutting east from the Hale and Norcross deep winze, or west toward it from the Combination shaft, can be done at a proper depth, the actual merits of the rich ore vein developed on and below the 3,000 level cannot be known and developed. The present promise at that point is most certainly very great for another old-time bonanza. It is true that the rapid decrease of the volume of water in the Carson river during the past week or two has already interfered with milling operations and necessarily will further retard and suspend ore reduction, throwing many miners and mill operatives out of work for several months, or until rains and snow shall again increase the river's source of supply; yet this is merely a temporary disadvantage, usual at this season of the year. The ore remains stored in the mines, ready for production and reduction when called for. Virginia City is better off to-day than it has been for a long time past. More men are employed in the mines than there were three years ago. The long-continued depression has weeded out superfluous business establishments and driven away a large class of idle miners, gamblers, small politicians and parasites generally, who were wont to give an air of liveliness to the streets, but who were really a heavy burden upon the town. The business men who remain are doing well, and the miners have their wages for themselves, not now being compelled to support unemployed comrades as of old. The development on the lower levels of the middle mines has renewed faith in the existence of ore bodies at great depths, and so given Virginia a new lease of life. The down-grade movement was arrested when the long-neglected upper levels of the mines were reopened. So far from the city being a "deserted mining camp," it is now about as prosperous as are most of the interior towns of this State. The uncovering of another bonanza—an event which is always possible—would cause a resumption of exploration on the deep levels all along the old lode, and the Comstock would be itself again. But bonanza or no bonanza, Virginia will not die in our day. There are great bodies of low-grade ore that will keep the miners and the mills busy for years to come. And such vast prizes have been won in the lottery of Virginia's hills that the hopeful prospector will continue to dig and try his luck indefinitely.

CONSOLIDATED CALIFORNIA AND VIRGINIA.—On the 1,700 level the northwest drift from the upraise on the ninth floor has been extended and has connected with the 1,600 level. From the 1,750 level they have extracted 925 tons of ore, and shipped to the Morgan mill 730 tons and 144 pounds. The average assay value of ore milled during the week, as per samples taken from the batteries, was \$25.29 per ton. Ore extracted under the Jones contract, 420 tons, and shipped to the Eureka mill, under this contract, 522 tons and 555 pounds. The average assay value of ore milled during the week, as per samples taken from the batteries, was \$16.67 per ton.

BEST AND BELCHER.—On the 1,000 level west crosscut No. 1 has been extended 50 feet; total length, 318 feet.

UNION CON.—On the 500 level the drift running north has been extended 70 feet.

MEXICAN.—On the 500 level a west cross-cut was started, and has been advanced 46 feet.

OPHIR.—On the 500 level the upraise has been continued upward 27 feet.

SIERRA NEVADA.—On the 520 level the north lateral drift has been extended 46 feet; total length, 937 feet.

GOULD AND CURRY.—On the 1,000 level west crosscut No. 1 has been extended 54 feet; total length, 66 feet.

Jefferson District.

THE MILLS.—Belmont *Courier*, July 25: The Harrison mill at Jefferson is still running and the bullion produced is very fine. John B. Truman has a force of men engaged removing the machinery and the building of the Jefferson S. M. Co.'s mill to Park Canyon, where it will be put in position and started up on ore from the Giant mine, on which work will soon be vigorously pushed.

ARGENTIFEROUS GALENA.—Gallatin & Folsom have shipped a carload of ore from Steamboat to Salt Lake for reduction. The ore is from the old Shannon mine, near Steamboat, and is galena, assaying \$55 in silver and carrying 67 per cent of lead. It is the intention to ship a carload every week to either Salt Lake, Denver or San Francisco. These mines were worked as early as 1861.

Mineral Hill District.

AN ORE MARKET.—Cor. *Eureka Sentinel*, July 31: The statement that parties from Utah were on the Base Range for the purpose of purchasing iron and lead ores for the Salt Lake smelters, was hailed with special satisfaction by mine owners throughout this vicinity, where we have such large quantities of lead ores. The owners of this class of mines look upon any new arrangement which will give them encouragement to work their mines with the prospect of getting a fair deal with marked approval. Sixty-two per cent of the assay value, and nothing for lead under 20 per cent, has obviously had a tendency to retard developments in mining property throughout Eureka county, and it is safe to assume that where one "outside" mine is working to-day there would be half a dozen if the owners thought they would receive a fair margin for their ores. It cannot, of course, be said that ores can be reduced as cheaply here as in Colorado, where tenounce ore pays a profit; but it is very unreasonable to suppose that any furnace company claiming to work their own ores up to 90 per cent of the assay value, cannot afford to pay over 62 per cent of the assay value for certain ores after charging full rates for reduction. The mine owners know this as well as furnace managers, and will, of course, welcome and encourage any innovation on the old established schedule tending to give them better rates for their ores. The mill at Mineral Hill is running along about as usual and turning out the usual amount of bullion, and the mines are looking well.

Oseola District.

BOTH PLACER AND QUARTZ.—*Eureka Sentinel*, August 3: Active work is being done in Oseola in several of the gold quartz mines. The camp has a population of upwards of 300, and aside from Taylor it is the liveliest settlement in those parts. The gold quartz mill runs about two weeks out of every six or eight, or whenever sufficient ore collects to keep it employed for a time sufficient to justify its starting up. The gravel mining company have all their appliances working satisfactorily, and it is believed by many that the result at the next clean-up will exceed the expectations of the most sanguine of the shareholders, and yet they are working the gravel some 18 feet and upwards from bedrock. But one six-inch nozzle is now employed on the banks, but inasmuch as the water pressure is sufficiently great to send boulders as large as a man's body into the air the work it accomplishes is enough to keep 20 men employed. The water now at the command of the company, some of which is brought from a high mountain 17 miles distant, is more than sufficient in quantity as well as pressure for another nozzle of the same size, and it is very probable such addition will be made at an early day.

Tuscarora District.

BLUE JACKET.—*Times-Review*, July 30: Superintendent Milford has made a perfect success in treating the Blue Jacket ores by free-milling process, obtaining bullion over 800 fine, and working the ores to 88 per cent of fire assay. He is now engaged in changing the mill to wet crushing, as it will save largely in expense of reduction, and complete necessary experiments preparatory to the erection of a 60-stamp mill.

Walker Lake District.

BIG STRIKE IN LA PLATA.—*Bulletin*, Aug. 1: The gold ledge lately discovered here by Brady, the prospector, is probably a very big thing. The rock is free gold quartz, and the ledge from ten to twenty feet wide on the surface, the average assay of which is over \$700. Several valuable gold discoveries have been made recently in the same district, and in others in this neighborhood, but this is the greatest up to the present time. La Plata is situated in the Lake District, about nine miles Southeast of Hawthorne, from which place it is easily accessible. This is a large district, full of mineral, and comparatively unknown. It has only been of late that gold was found to be the prevailing metal. The few prospectors who worked that section having confined themselves to looking for silver. Lake district will, doubtless, soon contain several lively mining camps, as the excitement over this last discovery is very great, and much prospecting will soon be done there.

AT KINKEAD.—Most of the miners here are now idle, and all will be laid off in a few days, until the well is sunk to a better supply of water. The well is to be sunk 180 feet further, which will make a total depth of 370 feet. The work will require twelve or fifteen days. It will be bored, and the borers are to arrive from San Francisco in a day or two. They charge \$1.50 a foot. A concentrator will soon be built here, which will work all kinds of base ores. It is confidentially believed that there will be enough water to run the mill and concentrator to their full capacity. Custom rock will be worked when the water supply is increased, and prospectors will be greatly benefited. The price will be \$7 per ton. L. McNeil, the foreman, is a thorough millman, of extensive practical experience and uniform success, and there is no doubt about the satisfactory result of the working of the mill. The mines near Kinkead are all looking well and most of the owners expect to make money fast as soon as they can get their rock worked. There are now about forty men chopping wood for the railroad contract.

CORVILLE CROPPINGS.—The North Star mine is taking out \$600 ore. The Silver Brick mine is taking out a better quality of ore. The Mount Cory mine is working eight hour shifts.

GOING ON AGAIN.—On Sunday forty men went to work in the Holmes. A combination of wages, silver depression and lack of water caused the stop-

page of work, and the men of Candelaria, knowing that the company was not making money under all the disadvantages and realizing that should they leave they could find no other place where they could do better, appointed a committee to visit the managers and offered to take reduced wages. Their wise conduct in this emergency has doubtless saved the camp from desertion, and their ability to look at both sides of the question in a fair spirit shows that when the managers of the mine evince a disposition to deal liberally with their employees the men will not be behind hand in making concessions. The company is vigorously pushing work on the water supply, and as soon as this is finished the force of miners will be increased to the former strength, or perhaps, even more, and no uneasiness need be felt about the future of Candelaria, which will, in a few months, resume its station at the head of the live mining camps of Nevada.

ARIZONA.

WALLAPAI.—*Tribune*, Aug. 1: Returns from the Selby smelting works have been received concerning the ore shipped from the Avis Supai mine, situated on Cataract creek. About ten tons of ore was sent as a venture, which netted over all expenses, \$67.50 per ton. This clearly demonstrates the fact that this mine is of such character that great possibilities may be expected of it and the locality in general, as there are several mines close by to the original. The placer mining is an important industry in Yuma county. A large number of people are employed and considerable gold dust is being received at Yuma. The McCrackin lode at Signal is attracting considerable notice from the outside world, and the prospects are that a large mill will be put up on the Signal mine in a short time, which event will cause things to boom in and around that place.

ABOUT PRESCOTT.—*Miner*, Aug. 1: Fred, Maroney came in to-day from Copper creek in western Yavapai, bringing with him ore from a mine which he owns, that assays into the hundreds. The ledge he reports eight feet from wall to wall, all carrying this high grade ore. At Antelope, Stanton keeps a large force of men at work placing, with excellent results. On the Hasyampa quartz a force of men are washing out gold, and find from \$3 to \$5 per day to the man. The Hartford Copper Company, with Mr. Isaac Stoddard as general manager, has made contracts for opening up some of their claims near Copper Mountain, with a view to starting their smelter. Rudy and Martin, near Skull Valley, have put in sluice boxes and commenced hauling rich gravel from the placers recently discovered by Mr. Rudy. "Old Gizzy" is expected daily from the East, when he will put men at work on placer diggings in the valley of Walnut Grove. The old Vulture, under its new management, is said to be prospering.

COLORADO.

DOLORES COUNTY.—*Tribune-Republican*, August 1: The Maggie and Sunlight lodes at Mount Wilson expect to keep 15 jacks busy this season packing ore. The small force at the Puzzle extension is doing good work and has run 100 feet of tunnel since the 25th of last month. The Chestnut lessees are in about 300 feet with their tunnel, and have several inches of high grade mineral. A low grade shipment was made last week. The Grand View smelter is receiving the large quantities of ore recently purchased from the Sheridan, Mendota and other San Miguel mines. The date when the smelter will blow in for its long run is not far distant. The tunnel cut the Premier vein at a considerable depth, and shows 3 to 4 feet of quartz ore very similar to the high grade from the upper workings, which made something of a sensation last fall. The Grand Luke Company have decided to run a tunnel to tap the Forest vein at a considerable depth. It is to be 248 feet long and will cut the vein 172 feet below the surface. The next property on which they propose to commence work is the Dawn of Day. Work on the Hidden Wealth is progressing with encouraging results and is showing a very nice streak of heavy galena ore, and considerable copper ore is also being saved. So far the value in silver is not high, averaging 10 to 12 ounces per ton, the lead ore carries 60 per cent of lead and copper ore, 10 to 15 per cent of that metal. A very slight improvement in value will raise it to a paying grade, as the ore can be placed on the dump at a cost of \$2 per ton. Receipts of ore continue at the Pasadena smelter in large quantities from both local mines and the divide. The thirty-ninth carload of bullion has been sent to the railroad, and the fortieth is now on hand. The castings for the new furnace are being turned out as fast as possible, and work upon it will be commenced at an early date. When completed, it is not proposed to have an idle moment at the smelter, as whenever it is necessary to blow out one of the stacks, the other will be immediately blown in, if not already in operation. Samuel Jones, Jr., the metallurgist, is now absent in Telluride and other points north arranging for the delivery of certain ores from there. All improvements at the coke ovens have been completed, and six splendid ovens are now ready for business. The warehouse for the reception of ores is finished and the wagon road to the coal banks will be completed soon.

SAN JUAN COUNTY.—*Animas Forks Pioneer*, July 30: The Dora mine started up with its full force again Monday. The shaft has been timbered up and a boarding-house built, and the accommodations for the men are much better. The San Juan Chief mine has commenced shipping ore. There are only three men at work at the mine at present, but more will be put on soon. Dr. Stevens will experiment some on the ore this summer, shipping it to different mills and find out the best mode of treatment.

EXTENSIVE PLACERS.—One of the prominent Colorado mining enterprises, attracting attention at the present time both at home and abroad, is the Sovereign, situated in Park county, just over the Mosquito range from Leadville. This property, embracing hundreds of acres of placer ground and innumerable lodes, is now being developed under the commendable energy of Mr. R. M. Whipple. The territory of the company includes nearly all of the old Montgomery mining district, which in former years produced large quantities of gold from mere surface workings along the various lodes, and by primitive sluicing of the extensive auriferous gravel banks,

IDABO.

BETTER TIMES IN GALENA.—*Wood River Times*, Aug. 1: The town of Galena is at last looking up, and indications point to a permanent improvement in that thrifty town. The Senate company has had 30 men at work for some time, and will "blow in" its smelting furnace this year. If the furnace runs successfully, it will be kept going permanently, as there is a vast quantity of ore in sight in the various leading claims thereabout. Now that Sawtooth, Vienna and Galena are getting well started, the upper country will boom.

LOST RIVER AND ANTELOPE CREEK districts are alive with prospectors, and the developments there being exceedingly promising. Mr. Biddy has retained two teams, and expects to keep them busily employed hauling ore. The Cliff furnace was blown in last Wednesday, with good prospects for an all summer and fall campaign; and the managers intend, if the outlook continues as favorable as at present, to double their smelting capacity this fall.

KETCHUM is at present the liveliest town on Wood river. The Philadelphia Mining and Smelting Company is operating two stacks, and keeping a small army of men and teams at work, and money is getting into circulation and causing times to improve all around. A great deal of dead work is being done and much prospecting. New finds are being made, some of which are very valuable. J. H. Moyle, superintendent of the Warm Springs Mining Company, on Warm Springs Creek, is working twenty men in the different mines under his supervision and the concentrator. Regular shipments of concentrated ore are made to the Philadelphia smelter at Ketchum. All the properties of this company are looking well, and indications point to a yield of ore for the season better than ever before.

LITTLE SMOKY MINES.—All the mining properties on Little Smoky that are being worked upon are steadily improving, generally, but some are developing rapidly into large and valuable ore-producers. The Carrie Leonard is the best opened mine in that section at the present time. There is plenty of ore in sight. There are now some twenty-six tons of \$300 ore on the dump ready for shipment, and many tons of \$75 and \$100 ore easy of access for shipment. The Isabella mine is looking well, and ore is being taken out. The King of the West presented a fine appearance, and a good lot of high-grade ore is being extracted. Superintendent McIlhenny will commence shipping ore to Hailey as soon as the new Camas wagon-road is extended up the Little Smoky to the mine, which will be early next week. The Silver Star mine will commence shipping ore to the smelter early next week. As the season advances and the many hundreds of prospects in the Little Smoky section are developed, it will not be expecting too much for a large output of fine ore from that section this season.

MONTANA.

BURLINGTON.—There are at this place about 150 inhabitants; three saloons, two hotels and five lodging houses. There are at least 100 men at work in the mines, and with the prospect of that number being materially increased in the near future. There is evidently a mining boom at the Independence Mining District. The place that is receiving the greatest benefits from this revival in mining, is the town of Burlington. Much work is being done in the district. Messrs. Rodda & Co. are working four men at present, and are taking out considerable ore from the 120-foot level of the Fredonice mine. The stopes and drifts on this level are looking well and producing rich ore. Arrangements are being made to sink a new shaft in the middle claim of the mine. The shaft will be sunk on the ledge and pay rock will be taken from the shaft. Considerable work is being done on the Blue Bird mine, about forty men being employed. The mine looks well all through, and steps are being taken to sink the main shaft below the 300-foot level. The company are shipping their ore to the Lexington and Silver Bow mills. The Burlington mine, owned by the Colorado Smelting Company, is worked almost exclusively on the leasing plan. Messrs. Reynolds & Co. are prosecuting work on the 50-foot level, and are extracting large quantities of ore from that point, that will assay about 40 ounces in silver. The pumping and hoisting machinery just put up is working admirably, and steps will be immediately taken to resume the sinking of the main shaft. The shaft is now down 65 feet, and the ledge at that point looks well. Messrs. Reynolds & Co. are now taking out about 10 or 12 tons a day, and this quantity will be materially increased when the work of timbering and otherwise repairing the shaft is completed. Messrs. Masters & Co. are working three men, and are taking out a large quantity of ore daily, from the 50-foot level. The ore assays about 40 ounces. The Little Darling mine is worked under the direction of C. H. McSherry & Co., with a force of fifteen men. Considerable good ore is being extracted from the mine. The Narrow Gauge mine, owned by August Mills & Co., is worked on lease by Messrs. Olsen & Co., who are working a force of five men. Considerable ore that will assay 45 ounces in silver is being extracted. The general appearance of the Narrow Gauge is very flattering, and work is being prosecuted with vigor.

MINES AND MINING ABOUT BUTTE CITY.—*Miner*, July 25: There was never a time in the history of Silver Bow county, when the mining outlook is more promising than at present. Good reports are continually coming in, not only from the large mines of Butte City, but also from the smaller mining properties situated in the hills, valleys and mountains adjacent to the city. It is doubtful if a more prosperous mining camp than this ever had an existence. This is shown by the rapid and steady growth of Butte City, which has, during the past four years, surprised the mining world by the rapid strides it has made in the way of prosperity and population. The output of this camp is something wonderful, while the outlook is conceded by men of all classes to be full of hope and promise. During the past week in some of the leading mines of Butte, developments have been made that have exceeded the most sanguine expectations of the respective managers and owners of the mines, and that have insured to our people an indefinite period of prosperity. Like all other mining camps we have had, and will doubtless continue to have, our reverses and setbacks. These, however, will not arise from a scarcity of ore in the district or a lack of enterprise on the part of our mining men, but as long as the

mines of this camp are worked in the same legitimate plan in which they are at present conducted, and wild-cat schemes, stock-jobbing and the thousand-and-one different modes of mining known to and practiced by the mining sharps of the East and West are excluded and condemned by the owners and managers of our mines, so long will Silver Bow county enjoy prosperity, and be admired by all persons engaged in producing the precious metals. The state of Nevada is to-day under a cloud, from which it will not emerge for years, on account of the mismanagement of some of the mines within its borders. Mining in many parts, indeed, in nearly every part of Nevada, is worked upon and conducted on the principle of gambling, and so many people who wish to follow the business of mining in a legitimate manner have been robbed by the mining sharps of Nevada, that it is now as difficult to dispose of a really good mine in Nevada to a foreign or home company as it is for a Butte City rounder to scare any of the pencil pushers of the *Miner*. Shall the mines of this district be conducted in such a questionable manner that a person seeking a field in which to invest his capital would not touch Butte with the proverbial forty-foot pole? We hope not.

NEW MEXICO.

LAKE VALLEY MINES.—*Rio Grande Republican*, Aug. 1: Within a few weeks work will be resumed at these mines. The arrangements for the erection of new works have all been completed, and it only remains to let contracts for putting up the buildings and the proper machinery. The old mill, which cost \$505,000, will be partly utilized but greatly added to. It has been proven that the ore is not free milling and for this reason the plant first put in operation is useless. The new mill will subject the ore to the leaching process. Thousands of tons of ore, now on the dumps, was mined while searching for the rich pockets that made these mines so famous, and it is estimated that it will run from 12 to 22 ounces; all ore of a higher grade was shipped East.

MINING ITEMS.—*Socorro Bulletin*, Aug. 1: The Bonaparte tunnel is in 35 feet, on a full breast of pay mineral, the ore is being sacked for shipment. The Juanita mine is working 40 men, and the force will be increased shortly. It ships about 10 carloads of ore weekly. F. Wilson is operating in the Iron Mountain district on the old Boss mine, and will continue throughout the season. Col. E. L. Mann is deepening shaft No. 1 of the Silver Gance, in the Limiar district. It has attained a depth of 170 feet, and the work is being performed in line, in which copper and galena appear sporadically. The development of the Lion mine is still going forward, Col. Eaton having let a contract recently, and when it expires he will let out another, until the property makes a satisfactory showing. A new mining company is formed for the exploitation of several mining properties in this county. The claims which the new corporation are to develop are situated in the Pueblo district, and produce rich argentiferous copper and galena-bearing silver. Capital properly expended, there is every reason to believe, will place a number of these properties upon a producing and paying basis. Thirty-six men are now employed by the Merritt Mining and Milling company. This number will be materially increased as soon as stoping is inaugurated, which will occur in a few days.

OREGON.

MINING NEWS.—*Sentinel*, Aug. 1: Klippel & Co.'s windmill on Applegate is approaching completion. Work on the Sterling Mining Co.'s reservoir is progressing steadily. John Owens, of Gold Hill, stumbled on a fine quartz ledge in that vicinity a few days since, and it is said to have been the property of a miner murdered many years ago. There is considerable excitement at Woodville, some promising quartz ledges having been discovered. A shaft 40 feet deep has been sunk on Lind, Kinney & Co.'s claim, with flattering results. The subscribers to the stock for a quartz mill in this place have formed a temporary organization and appointed a committee to select grounds for the proposed mill and obtain motive power. The certainty that we are to have a new test quartz mill at Jacksonville has given an impetus to quartz prospecting and the result is some very important developments. The parties working on the Yank ledge sent up Victor Fernbaugh, reputed to be a very capable expert, to examine the mine, who expressed himself well pleased with it. On Thursday's freight 900 pounds of ore was shipped to San Francisco for mill test. There is no occasion for any excitement, but indications are that the mine will be worked, and that means prosperity for this county.

UTAH.

ALTA ITEMS.—*Salt Lake Tribune*, Aug. 4: The Frederick and Crown Prince mine is working from 25 to 30 men. The tunnel is in about 1,600 feet, and the work is vigorously prosecuted day and night by the best miners in the district, using the Ingersoll rock drill air compressor. The property promises to be a very valuable one, and everything connected with it is being done in superior style. The wall for their new building is very strong, and when completed it will be the safest in the district from the dread snow-slide. In connection with the mine, there is 1,000 feet of switch built lately from the Alta tramway in order to move conveniently to ship freight to and from the mine, which is a great accommodation to the company. There are a few men working the Toledo on lease. The managers of the Vallejo are pushing their great mine ahead day and night, and frequent shipments of ores have been made. The Flagstaff has been inactive for years, but it is said Professor Vincent has left London for Utah with sufficient capital to resume work upon it.

COPPER PRODUCT.—The Arizona Company, at Clifton, produced in May, with two furnaces in blast, 579,583 pounds; and in June, with three furnaces, 759,187 pounds. The Detroit Company, at Clifton, produced 560,000 pounds of copper for the two months of May and June, with but one furnace in blast.

THE NEW EMMA has been in operation for years under the superintendency of George Cullins and his foreman, John Stilwell, who are pushing the mine forward with all possible speed, day and night. There are now 25 men working in the mine. That force will soon be increased. There is a shaft in the tunnel about 1,800 feet from its mouth; now 200 feet deep, and in the lower level 240 feet deep,

Pacific Machinery Depot.

FRASER & CHALMERS,

Cor. Fulton and Union Sts., Chicago, Ills.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and
HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street

San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

218 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, an GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

A Suggestion for Our New Chinese Minister.

Now that the newly-appointed minister to China has arrived in San Francisco, we unite with others in tendering him such advice as we think may prove useful to him. We advise, then, that he declare, when he reaches the court to which he is accredited, that he is opposed to any further emigration of the Chinese to this country. This he should do both as a matter of policy and duty; of duty, because it would be right, as we do not want them here, and of policy, because the authorities of that country do not want them to leave, and this for many good reasons. It is, of course, well known that it has from time immemorial been the aim and desire of the Emperor of China to retain all his subjects at home, death being formerly the penalty meted out to any one going abroad. Now, that Government has never released that rule except as circumstances have compelled them to do so. They would, were they able, be glad to enforce it at this time and would, no doubt, regard with special favor any foreign minister who would second their desire in this regard. We think Col. Denby would do well to duly weigh this suggestion, as it would insure to him great advantages were he to act on it when he reaches Peking.

How Not to Mine Silver.

A correspondent in the silver mining region writes us: "The silver-producing section has for 20 years past been the field of operations for a class of Eastern adventurers, who, by their wily schemes, have done much to prejudice the East against silver. One of their many jobs is worked out as follows: They purchase some worked-out mine for a nominal sum and start a small mill, and place the stock in the New York market. Sales start at a low figure, and under the incentive of small dividends (paid out of their pockets), and larger ones as soon as the mammoth reduction works are completed, the stock reaches a large price, and the swindlers unload; then comes the collapse, and a host of swindled people are ready to believe anything had about silver. Again, some well-meaning capitalists form a syndicate for mining in a legitimate manner, and send some young college graduate out to superintend operations, who don't know a drift from a cross-cut, and whose only recommendations are a portion of the alphabet appended to his name. This gentleman generally erects a mill the first thing, not particularly because the mine justifies it, but 'everyone needs a mill, you know.' 'Plenty of ore in sight, must have the mill ready when we begin extracting it,' and so on to the end of the chapter, and about the only extracting this young gentleman does is from the pockets of the stockholders. He soon works out his bonanza, and leaves a large monument of his folly behind. When men have lost money in silver mining either through avarice or inexperience, they are apt to be slightly prejudiced, and to do all in their power to misrepresent legitimate mining to the general public."—*American Machinist.*

Mining Share Market.

From the lowest depths of last week the Mining Share Market has since reached a lower depth, nor has the bottom probably yet been reached. It really looks as if ore developments on the Comstock affected stocks in the inverse ratio of the importance of such developments; that is, if the latter are even one-half as valuable as represented by the Virginia City papers, which record the discovery of bonanzas almost daily. But this being the day of small things on the Comstock, these reported discoveries must be viewed accordingly.

Bullion Shipments.

Standard Con. July 29, \$10,911; Grand Prize, Aug. 4, \$16,000.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature wind and weather at 1200 M. (Pacific Standard time, with amount of rainfall in the preceding 24 hours.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

A BIG CEDAR TREE.—If any of our readers are not inclined to believe the following story, they can say that the *Oregonian*, of Portland, invented it: "Over at Yaquina bay there is a fallen cedar tree eight feet through, which must have lain there a long time, by the fact that two trees have grown over it, one six feet in circumference having two roots that reach down into the ground, one on each side of the log, the other five feet through that has three roots running into the earth. The fallen log is perfectly sound as when first it fell."

THE reports received at the State Bureau of Labor Statistics show that outside of San Francisco the city of Sacramento heads the list in the variety and extent of its manufacturing establishments.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

To Young Men and Young Women.

All student boys and girls should prepare themselves for usefulness in business if they wish to "step up higher." We have for sale to such, on easy and favorable terms, a scholarship in one of the best business colleges in the U. S. Address this office.

BOYS AND GIRLS may be had—particularly boys—for service at wages, for indenture, or for legal adoption, by applying with recommendations to E. T. Dooley, Supt. Boys and Girls' Aid Society, 68 Clementina St., San Francisco.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JULY 28, 1885.

- 323,299.—ROTARY HARROW—Cureton & Kaino, Cuffey's Cove, Cal.
- 323,300.—PORTABLE HOUSE—Wm. Elford, Oakland, Cal.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.

611 and 613 Front St., San Francisco.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,

316 California St., San Francisco.

HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept. 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly, (Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sir: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours, (Signed) W. S. TOWNSEND.

Send for Circular and Prices.

Best Balanced Pulley in the World. Also Manufacturers of

SHAFTING, HANGERS AND APPURTENANCES.

SEND FOR CIRCULAR AND PRICE LIST.

Nos. 129 and 131 Fremont Street - - - SAN FRANCISCO, CAL.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

ASSESSMENT NOTICE.

Grosh Consolidated Mining Company.—

Location of principal places of business, Room 39, Merchants' Exchange, San Francisco. Location of works, Storey County, Nevada.

NOTICE is hereby given, that at a meeting of the Directors, held on the 13th day of July, 1885, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 39, Merchants' Exchange, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1885, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday the 31st day of August, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

A. C. HAMMOND, Secretary.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator in working order and ready to make tests at the Fulton Iron Works, No. 229 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

THIS CUT REPRESENTS OUR
**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Professor George Davidson.

A Sketch of Our Most Prominent Pacific Coast Scientist.

Probably no name is better known in the scientific world of the Pacific Coast than that of Professor George Davidson, of the U. S. Coast and Geodetic Survey. His active and untiring efforts, extending over a long period of time in advancing the interests of science on this coast, are well known; and the work he has accomplished in the service in which he holds high rank has earned for him a name and reputation which might be envied by any man. A brief sketch of his life and services will be of interest to very many.

George Davidson is at the head of the Field Assistants of the U. S. Coast and Geodetic Survey. He was 60 years of age in May last, and has been on the Survey over 40 years on consecutive duty, serving from Newfoundland to Texas and from Panama to Alaska.

He came to the Pacific Coast early in 1850, when it was a new and difficult field, having been chosen for this special duty by Superintendent Bache. He served five consecutive years, winter and summer, on the Atlantic and Gulf Coasts before that, and afterward during the rebellion, and has been again upon the Pacific Coast since 1867.

In 1841 he was a student in the Philadelphia Central High School under Prof. Bache, afterward Superintendent of the Survey, who selected him for survey work, one year before graduation, from among hundreds of students who had been with Prof. Bache. He entered the Survey June 1, 1845, upon graduation.

Prof. Bache offered him the position of assistant in charge of the office in 1850, which offer was declined, and he was selected for duty in California before he was 25 years of age; and was for several years specially engaged in the determination of the latitude and longitudes of prominent capes, bays, etc., and of the magnetic elements of the Pacific Coast, reporting also upon the proper location for light-houses. Prof. Bache frequently declared that his energetic work in 1850 saved the Pacific Coast items in the appropriations in the succeeding Congress.

Prof. Davidson has made himself thoroughly familiar with the currents on the Pacific Coast and discovered the existence of the inshore eddy current which affects all bays and influences all improvements for harbors of refuge. He has given great attention to all hydraulic problems, to the water supply of large cities, the sewerage of the large cities of Europe and America, and the drainage of great districts (Egypt, Italy, Holland, etc.). Most of these studies were directly connected with the work of the Coast and Geodetic Survey.

Beyond these he has been an active member of the California Academy of Sciences and has published original investigations in geometry, in the devising of new instruments of precision, in the physical appearance of Saturn, Jupiter and Mars; on the constitution of the tails of comets, the plateau of the Pacific off the California Coast, etc. He has produced papers upon methods of determining the solar parallax, the introduction of science in our public schools, the endowment of scientific research by the State, the necessity for a physical survey of this State, etc. To the Geographical Society of the Pacific he has presented papers upon the ascent of the Makushin volcano, the eruptions of Bogoslov and other volcanoes, on the shoal-

ing of the bar of San Francisco bay, the dangers of future shoaling, etc.

He has been engaged in every variety of field work, and is familiar with the use and detailed construction of every instrument; he has devised new and economic forms; knows the methods of investigation employed; made the first complete series of observations for coefficient of refraction on this coast, and two subsequent series (published); has had charge of the San Francisco sub-office for the greater part of 17 years; and has proved his administrative capacity and executive ability in every position.

Outside of his regular official duties, Prof. Davidson has written three editions of the "Coast Pilot of California, Oregon and Wash-

cific Coast; and the records of the computing division show that the results of his observations stand higher than any ever executed in America, Europe or India. The superintendent has approved special results and operations of this work "as unique in the history of Geodesy," and has praised the character of all. And whilst its magnitude and difficulties are greater than any abroad, it has been carried on more economically and more rapidly than any other.

In 1881 he measured the longest base-line yet attempted in trigonometrical operations, and with the greatest accuracy. In acknowledgment of the character of the system of triangulation developed from the Yolo base-line to the

PROFESSOR GEORGE DAVIDSON.

ington," and at the request of the superintendent, is at work on the fourth edition. He also wrote the "Coast Pilot of Alaska, Part I," published in 1868. He has computed a field catalogue of transit stars (published), and by direction of the superintendent has completed an extended catalogue of 1,278 stars for a second edition (published); has computed a table of 67,000 star factors to three places of decimals (published), and is engaged upon another equally extensive, but requiring greater labor.

After Prof. Peirce's appointment in 1867, Prof. Davidson was placed in charge of the work on the Pacific Coast, and laid out all the schemes of work for all the land parties from 1868 to 1875, and inspected all the fields of work. An appeal to the records will show greater general progress, and more system in that period than at any other. He made telegraphic connections for longitude with all the different centers of triangulation and topography, and in the telegraphic longitude work between San Francisco and Cambridge, determined directly the signal time over 7,200 miles of line. He determined the Eastern boundary, 120th meridian, of California, in 1873.

After his return from Japan, Italy and Egypt, in 1876, he was placed in charge of the main triangulation and astronomical work of the Pa-

Sierra Nevada and the Coast range, and the high standard of the observations, the superintendent has designated it by the name of the "Davidson Quadrilaterals."

For his services when in charge of the Pacific Coast work, Superintendent Peirce had him promoted to the head of the list of field assistants for administrative capacity and special aptitude.

He has, moreover, kept abreast of all scientific progress correlated with the work of the survey, and in 1874 was elected a member of the National Academy of Sciences. He has been re-elected President of the California Academy of Sciences from 1871 to 1885; elected President of the Geographical Society of the Pacific, at its inception in 1881; made life member of the Academy of Natural Sciences of Philadelphia for special services (1855); elected member of the American Philosophical Society, 1865; Fellow of the American Association for the Advancement of Science, 1880; received the degree of Doctor of Philosophy from Santa Clara "for advancing the cause of true learning" in 1876.

Prof. Davidson holds the position of Honorary Professor of Geodesy and Astronomy in the University of California (1873), made at the suggestion of Prof. Peirce; and was a Regent of

the same institution from 1877 to 1884. At his own expense he has maintained the first astronomical observatory on the Pacific Coast of North America; and has given the use of his equatorial to the Survey when special observations demanded it.

In 1867 Prof. Davidson was appointed to make a special examination and report upon the geography and resources of Alaska, pending its purchase, and his published report and conferences with Congressional committees influenced the passage of the bill appropriating the money. In 1871 he was appointed by the Secretary of the Treasury to examine and report upon the weights and balances of the U. S. Mint at San Francisco (published). In 1873 was appointed by the President of the United States one of the three U. S. Commissioners of Irrigation of California, with General B. S. Alexander and Col. G. H. Mendell. The report made by these Commissioners was published by the Government. Prof. Davidson afterwards went officially through India, Egypt, Italy, etc., to study the same subject (published), and to examine and report upon harbors of refuge, etc. (published).

He was also appointed by the President one of the three U. S. Advisory Commission for the Harbor of San Francisco, with Admiral John Rodgers and Col. G. H. Mendell; was sent in charge of the U. S. Transit of Venus Expedition to Japan in 1874; determined (at his own expense) the telegraphic longitude between Nagasaki and Tokio, Japan, and presented the observations to the Coast Survey; was sent to Paris Exposition in 1878, to examine the instruments of precision applicable to astronomy and geodesy, and was there selected by the French and foreign jurors the president of the important jury on machinery, when that jury examined 3,800 pieces of machinery and awarded 850 prizes. For this service he received the large medal of the French Government.

Under instructions, Prof. Davidson has officially visited many of the observatories and most of the prominent instrument work-shops of Europe; has visited the field and conferred with the officers of the Great Trigonometrical Survey of India, examining their means and methods; has visited the headquarters and offices of the geodetic work of France, Prussia, Great Britain and Switzerland to study their methods and appliances.

This accompanying engraving, made from a photograph by Taher, is a very faithful likeness of Prof. Davidson. Aside from his scientific attainments in special branches, the subject of this sketch is an exceptionally well-informed man on general topics. Traveled and well read, there are few subjects which have escaped his attention. His social qualities are such as to have endeared him to a large circle of friends, and his conversational powers of a character to make him one of the most agreeable of companions. Few men are so frequently consulted for advice or information. It is one of his peculiarities that he takes the greatest interest in young men, and is always ready to assist them in any possible way, a fact to which many he has helped can testify. Having grown sons of his own, he appreciates the thoughts and feelings of young men better than most men in his position are apt to do.

The writer of this sketch has been, as Secretary of the California Academy of Sciences, a co-laborer with Prof. Davidson for some 13 or 14 years, and intimately associated with him during that period. He is, therefore, in a position to know how highly the Professor's talents and social qualities are appreciated by those with whom he has been connected and to know of the elevated position he has attained in the scientific world. The whole Pacific Coast has benefited by Prof. Davidson's talents and energy, for a large portion of his successful life work has been performed on this side of the continent.

C. G. Y.

Let Us not Mislead Them.

While it is very desirable that the present population of California should be increased, there being ample room for many more people to live in comfort than are now in the State, still we should be careful not to overcolor the picture when in bidding for immigration we undertake to present the advantages offered by California as a place of settlement, for this is not a country without its difficulties and drawbacks. No laborer or man of small means should be encouraged to come to this coast thinking he can make a living here without hard work and the practice of economy, the same as is necessary in most other parts of the world. We have here a good country, much cheap land of fair quality, a fine climate, healthful, equable and agreeable. We have good laws, pretty well administered; life and property are tolerably well protected, and society is not much worse than in the older States. We have good schools, plenty of churches, wagon and railroads, with not overdear transportation; living is cheap, the staples of subsistence, clothing, fuel and rents included, being not much dearer here than on the Atlantic seaboard. But, for all these luxuries, comforts and advantages, the mass of the people, all who have to depend on their own exertions for a living, are obliged to hestir themselves, work good long hours, save and practice self-denial if they mean to get ahead or even keep the wolf from the door. This the intending emigrant should be made to understand before leaving his old home or even making arrangements to come here. What the *Willows Journal*, published in one of the richest farming districts in the State, has to say on this subject is so much to the point that we copy it in part:

The East is again being flooded with circulars descriptive of California, its wonders, advantages and possibilities. Although these are, in many instances, misleading, and intentionally so in part, still the charge of positive falsehood might be evaded by the vastness of our State. To read some of them, those who are not acquainted with California would think the orange and the redwood, the pomegranate and the pine, grew side by side. That the loftiest mountains and the broadest valleys enjoyed equally the "glorious climate," and that the sad sigh of the forest fir and the gentle rustle of the olive were blended like the dulcet tones of a midnight serenade. We have yet to see in any of these so-called descriptions of California any statement calculated to prepare the immigrant's mind for California as it is. Let it be known that our State is 750 miles long by 250 in width, and that what is said of California includes all that is found within its broad bosom. That within this vast domain is found every variety of climate, from perpetual snow to eternal spring. That the productions of the four quarters of the globe are represented here. That enormous woods, vast plains, huge mountains, magnificent cascades, sublime waterfalls, pleasure resorts, prodigious crops, healing springs, mineral deposits, luxury, wealth, comfort, health and happiness are truly to be found in California, but that it requires a territory of 188,000 square miles to contain it. It requires money to travel in California. The exploration of a mountainous country is always expensive, and the man without capital will be able to see but very little of this coast. Again, what may he said of Los Angeles cannot be said of Laseen, and what is true of Humboldt is not true of Stanislaus. One portion of the State is adapted to one thing, another to another. True, a great diversity of products may be grown in many localities, but it requires the combined industry and capacity of the entire State to justify the glowing descriptions sent out by schemers and land sharks, and even then a flexible conscience will not be a bad auxiliary. But this is not the worst feature of these circulars. The immigrant is told that there is plenty of Government land still to be had, and either by insinuation or positive assurance is led to believe that it is capable of producing the most varied and enormous crops. Now the fact is, no State in the Union has a population so wide-awake to the importance of securing permanent and productive homes as California.

We, of this State, are a live people, and being conscious of our opportunities, have not been slow to make the most of them, and it is not to be supposed that we have failed to secure most of the good land that is eligibly situated for settlement, and the Government lands that are left are generally of an inferior quality and remotely situated. There are some that can be rendered valuable, and will be, no doubt; but it will require both labor and capital. Suppose, for instance, a man with a family, and the right of homestead, settles in one of our northern counties, how is he going to live? How will he build his house and buy his tools and seed? Where will he get his provisions? By his labor? No! In these new settlements—and there is no public land anywhere else—they are all poor and equally dependent on their labor for support. There is plenty of labor, but no capital. They are far removed from market. It takes money to move the product of their industry, whether it be shakes, posts or grain. It is not necessary to resort to falsehood. The truth is ample. People with a small capital, by industry and perseverance, can do well here, can make money, can enjoy health, wealth and luxury. But without capital, with but the two hands and a willing heart, our advantages

are comparatively insignificant. If Government land of any value is found, it still takes capital to weather the storm until a start is made. We have a prolific earth, an invigorating atmosphere and a smiling sky. Our products are varied, extensive and unsurpassed, and the world is our market. All this may be enjoyed by the man with small capital, but to the man without it the prospect is not more promising than in many other places. If fruit is the object it must necessarily be three or four years before any return can be realized. If stock, a start is required. If you go into the mountainous portion of the State you encounter cold weather in its season, and must be able to prepare for and provide against it. All this takes money, and to invite emigration to our State unprepared for these things is only to cause dissatisfaction.

Supposed Grand Opportunities.

Touching the opportunities offered for the investment of money in mining properties, the *Chicago Mining Review* discourses as follows:

The continued stagnation of idle capital appears to indicate that there has been no marked improvement or advancement made by those controlling large sums of money. While capital has the reputation of being conservative, the history of events proves its dullness of perception, and its inability to grasp, in advance of a general movement, important views of advantage. Let the tide of investment turn in any given direction and thousands and millions of dollars are poured thoughtlessly and recklessly and unreasonably out to secure some fancied advantage or benefit, where reason clearly indicates that there is no substantial basis of realization.

A season of general activity for a time appears to prevail, in which capital seeks the most absurd and illy advised adventures, and is easily lured from its hiding place, even over a pathway which is marked by misfortune and disaster. On the other hand, when a reaction comes, ending in a general depression of business, the most inviting propositions, based upon the most substantial assurances of a steady and generous return, are considered calmly and indifferently, while opportunity after opportunity, in which there is every assurance of safety and security, is passed by unimproved.

In the early history of mining enterprises, a piece of gaudily printed stock was sufficient to secure money, without investigation, examination or knowledge of the basis upon which the stock was issued. Millions of dollars have been paid for these stock certificates, in many instances representing no tangible evidence of value, present or prospective. Capitalists were eager to exchange their money for these painted bubbles, which in thousands of instances were based upon six location stakes, where there was not even a semblance of a mine within miles of the locality designated. At the present time the scene is vastly changed. Years of steady and unremitting toil have pushed down shafts hundreds of feet throughout the mineral belt of the country, and demonstrated to a certainty the character, quality, value, cost and profit and all the important factors entering into a demonstration of the real basis of the mining industry. In many cases the amount of ore actually in sight is greater than the amount asked for the mine. In other instances the work of development, the acquired facilities, and the demonstrated value of a property, as a producer, is equal to the amount demanded for the same. These opportunities are presented in hundreds of mining camps, from one end of our mineral bearing territory to the other, yet capital turns a deaf ear and is dead and cold to every opportunity presented. In addition to this important advantage, these years of experience have furnished a class of qualified and thoroughly responsible experts, upon whose judgment millions may be safely invested. Marked improvements have been made in mining appliances. New methods of utilizing the ore product have been discovered. Marked reduction in transportation and other matters bearing upon the cost of producing have been secured, yet, notwithstanding all these permanent advantages, the plethora in capital centers still continues, and a great industry, extending over an immense portion in country, languishes in its enforced idleness.—*Chicago Mining Review*.

GOLD AND SILVER.—The *Chicago Evening Journal*, which can by no means be classed as a silver paper, makes the following statement: "If there is great danger that professional alarmists may succeed in creating a panic by exaggerating the perils likely to grow out of the silver coinage, it should be allayed by an understanding of the facts in regard to the relative amounts of gold and silver coin in the United States. The amount of gold coin in circulation in the country or stored in the banks or in the Federal Treasury is \$610,500,000. The amount of silver coin in the country is \$262,000,000. In order to create any great disturbance of values it is evident that there will have to be a great deal more silver or a great deal less gold available for commercial uses.

AN artesian well on a desert station in Kern county, Cal., has been completed, which gives a flow of 1,570,000 gallons in twenty-four hours, and the water rises eleven and a half inches above the pipe. The cost was only \$700.

The Republic of Colombia.

Now that many citizens of the United States, including some former residents of California, have acquired mining interests and contemplate carrying on large operations of this kind in the Republic of Colombia, some information in regard to the institutions and resources of that country, the character of the inhabitants, etc., can hardly fail to be interesting to our people. This Republic, which constitutes the northern portion of South America, is made up of nine different States, the entire number containing about 4,000,000 inhabitants, composed as follows: 1,375,000 are whites; 2,000,000 are mixed whites and natives. There are 1,500,000 Indians and 475,000 negroes and mulattoes. The whites, so-called, being Spaniards or the unmixed descendants of the race.

The principal articles of export from the country are included in the following items:

Metals and precious stones mined in the States of Cauca, Antioquia, Tolima and Boyaca, per annum.....	\$4,500,000
Quinine found in the natural forests of Cauca, Tolima and Santander.....	3,000,000
Coffee and cocoa.....	2,000,000
Tobacco.....	500,000
Cattle (Atlantic Coast of State of Bolivar).....	1,000,000
Hides, rubber, vegetables, ivory, stuffed birds, plants, etc.....	1,000,000

Total exports.....\$12,000,000

Foreign merchandise is imported to the value of from \$12,000,000 to \$15,000,000. It is said that with capital and suitable machinery, the mines can be made to yield \$30,000,000 a year. The nine States comprising the Republic of Colombia expended the following sums last year, without embarrassing their finances, except Panama, which has for some time been on the verge of bankruptcy:

Antioquia.....	\$700,000	Boyaca.....	\$180,000
Cundinamarca.....	900,000	Bolivar.....	300,000
Tolima.....	80,000	Magdalena.....	80,000
Cauca.....	400,000	Panama.....	250,000
Santander.....	500,000		
Total.....			\$3,300,000

The national debt, the interest upon which has been paid only in part since 1880, amounts to \$26,000,000, of which \$15,000,000 is owed at home and \$11,000,000 abroad.

The State debts are said to be small. The receipts of the National Treasury last year amounted to \$5,155,000, while the expenditures were only about \$4,000,000. The cost of putting down the rebellion in the State of Panama will this year be added to the ordinary expenses. The Republic of Colombia having now about \$1,000,000 of surplus revenue, the following public works have been undertaken:

1. A railroad from Cauca to the Pacific, of which 30 miles have been constructed.
2. A railroad from Cundinamarca to the Magdalena river, 15 miles built.
3. A railroad from the Magdalena to the capital of the State of Antioquia, 48 miles built.
4. A railroad between the upper and lower portions of the Magdalena, where navigation is interrupted by the rapids, 16 miles built.
5. A railroad from Santander to the Magdalena, six miles built.
6. Railroads from the seacoast to Barranquilla and Cienaga, in the States of Bolivar and Magdalena, 32 miles built.

Senor Nunez is the President of the Republic of Colombia. He is described as a white man about 55 years of age, of fine intellect, who has resided abroad, having spent several years in the United States and Europe, fertile in speech, a brilliant writer, a Liberal in politics and an ardent lover of liberty, brave, heroic and a man of unexcelled honor. With this showing, surely the Republic of Colombia ought to prosper. There have been five bloody revolutions in the Republic of Colombia within the last 50 years. To these may be added the Panama Revolution, which destroyed the city of Aspinwall and involved the loss of a great many lives. Prestan, the negro revolutionist, has recently been captured and will probably be disposed of in the usual Latin way.

On the Magdalena river no less than 19 steamboats are plying, all built in the United States. These transport about 50,000 tons of merchandise and 6,000 passengers annually. There are about 87,000 children in the 2,200 primary schools of Colombia, who are receiving a fair elementary education. In this Republic of 530,000 square miles there is a vast amount of natural wealth. Manufactures are at a low ebb. Machinists, masons, carpenters, and skilled mechanics in other trades do not abound. The crop of noisy demagogues is very large. What the Republic of Colombia appears to need to day is greater industrial productivity. But this is the need of all the Latin Republics and States, from Mexico down to and including Peru. The Republic of Colombia is well affected toward the United States, and is brought to-day into closer sympathy with us than any other of the Republics, either north or south of the equator.

The specie reserve in the Bank of France on the 7th of May, 1885, amounted to \$429,600,000, of which \$213,160,000 coined at a valuation that would make our dollar of 412 grains worth 103.06 cents, and which, if valued with respect to gold as silver is valued in our standard dollar, would be worth about \$206,637,000.

THREE FOURTHS of the standard silver dollars coined are in circulation.

And the Future—What of It?

We really wish we could answer the question we have here propounded in a way satisfactory to ourselves or any one else; the which we confess we are unable to do, the outlook being so mixed, puzzling and uncertain. The *Journal of Commerce*, published in San Francisco, and an authority on financial, industrial and trade matters, speaks hopefully of the prospect, in so far as California, and even the entire Pacific Coast, are concerned. The *Journal* thinks there are many and evident signs of the return of better times, and predicts that our merchants will have a better fall trade than for two years past. Of the prospects in the East, leading papers there do not speak so hopefully, insisting that the causes that produced the depression have not been removed, and until they are the indulgence of hope will probably yield nothing but disappointment. Confidence in the future of values, which has been so conspicuously absent since the present decline in prices began, is not being restored, and while the general belief is that prices have touched bottom, there does not appear to be any desire on behalf of the capitalists to invest. That is to say, it is conceded that values have reached a point below which they cannot well go, but, in the face of remaining obstacles, it is doubtful they can be advanced yet. One of the chief causes of the present depression, as heretofore stated, is the appreciation of the purchasing power of gold. The depression set in when the attempt was begun in Congress to repeal Silver Coinage Act, and is likely to continue until the question is finally decided, or until the gold bugs become so disgusted with their own efforts to force a single monetary standard upon the country, that they will desert the field and leave it to the people. There is room for no doubt now that the effort to repeal the silver legislation of 1878 will be renewed at the coming session of Congress, and, therefore, little room to hope for a revival of speculative enterprise and industrial activity in the meantime. The adoption of the gold standard will have the effect of still further appreciating its value, and this will have the corresponding effect of still further reducing values. Indeed, it may be said that this is the primary object of the moment. The banks are still overburdened with surplus cash and loans on good security, (Government bonds) can be made at the borrower's own terms. But there are no horrors, for the obvious reason that there is no speculation. Nor can there be any while legislation calculated to increase the purchasing power of money and the depreciation of the value of all commodities is in contemplation. This is a plain proposition, and to our mind satisfactorily explains the long continued and, to many, mysterious business depression.

THE MINER'S MANY PERILS.—Every trade is subject to its peculiar line of accidents. Thus, the carpenter is liable to split his great toe with a broad ax or chip off his knee cap with an adz; the blacksmith is exposed to burns and bruises; the stone mason to falls and spawls of rock in the eye; the sailor to falls and death by drowning; but the miner is exposed not only to the accidents of his trade, but also those incident to all others. He may be drowned, like the sailor; killed by an explosion of gunpowder like the soldier; burned to death like a martyr at the stake; scalded in hot water, crushed by falling rocks and caves of earth, wound up in machinery, have his head split open with an ax in timbering, his legs and arms broken by falling through floors, his neck dislocated by being run up in the sheaves, his head broken off by falling from a cage, and his whole body knocked out of human shape or reduced to a pulp or scattered in shreds by falling down a shaft. Also, in falling down a shaft, particularly through the pump compartments, there are so many projecting points and sharp corners of iron that he may suffer all the cuttings and rendings incident to any or all the trades of the world. In other trades we may calculate and to a considerable extent guard against the accidents that are liable to happen, but in mining accidents are constantly happening, the like of which was never before heard of. The miner is exposed to the accidents common to the use of tools of various kinds, falls and falling things, fire, floods, explosions, suffocating gases, scalding water and to machinery of various kinds moving in all directions.—*Rocky Mountain M. Review*.

ON THE RIGHT SIDE OF THE LEDGER.—A statement of the commerce of the United States during the fiscal year, ending July 1st, shows a satisfactory balance in favor of this country. The excess of exports is represented by \$165,000,000, indicating an addition of this immense amount of capital to the channels of commercial activity. This not only is proof of a healthy condition, as we are producing and selling more than we are using and buying, but it proves, also, that a movement of capital may soon be anticipated in the direction of productive industry, as this volume of export must tend largely to reduce the surplus of over-production, which has been given as the cause of our present business inactivity.

PRODUCTION of the precious metals in Mexico since 1493 amounts to almost \$3,000,000,000 or about \$1,000,000,000 for each century.

MECHANICAL PROGRESS.

Broken Set Screws.

J. F. Hobert in the *American Machinist* throws out some pertinent shop hints in the following pleasant manner: How do you like to dig out broken set screws? Fun, isn't it? Broken cylinder studs are nice, too. How do you do it? You get half a dozen little cold chisels and dig away at the end of that screw or stud trying to make it turn out: This will very often start a set screw, and where the screw is loose or fits badly the chisel will bring it every time.

When you get hold of an old rusty stud in an engine or Noah's earliest patent then you don't fool with chisels long. Perhaps you rig up a drill and put a hole right down through that stud. When you get in an inch or so you take out the drill, stick a punch in the hole and try to start the rusty thread by pounding on a punch with a monkey wrench. Of course you use a wrench. No machinist in his senses ever would use a hammer when he could get a wrench to jump up. Perhaps the studs start so that you can drive a square piece of steel into the hole you drilled and turn out the old root with your battered wrench, or perhaps you have to drill clear through the stud and then chip it out piece by piece.

We used to have a little kink that worked well at this business. We had a racket stock that would work left-handed. We made some left-hand drills and used them for drilling out broken screws and studs. They worked nicely. Often the screw would start to turn around from pressure of the drill. With a right-hand drill they would only walk in deeper, but with the left-hander the stud would start out and cramp the drill. You could start back on the feed, and work the bolt right out of the hole in "less than no time." Small jobs that could be put in the lathe came to time pretty quickly with our left-hand drills.

A BROKEN FILE.—There is no tool so easily broken as the file that the machinist has to work with, and is about the first thing that snaps when a kit of tools gets upset upon the cross beam of a machine or a tool board from the bed of an engine lathe. It cannot even be passed from one workman to another without being broken, if the file is a new one, or still good for anything, if an apprentice has got anything to do with it, and they are never without mending however great may be their first cost, unless the plaster of paris and lime treatment can make a perfect well without injuring the steel or disturbing the form of the teeth. Steel as hard as a file is very brittle, and soft solder can hold as much on a steady pull if it has a new surface to work from. Take a file as soon as it is broken and wet the break with zinc dissolved in muriatic acid, and then tin over with the soldering iron. This must be done immediately as soon as the file is broken, as the break begins to oxidize when exposed to the air, and in an hour or two will gather sufficient to make it impossible for the parts to adhere. Heat the file as warm as it will bear without disturbing its temper as soon as well tuned, and press the two pieces firmly together squeezing out nearly all the solder, and hold in place till the file cools. This can be done with very little to trim off, and every portion of the break fitting accurately in place. Bring both pieces in line with each other, and for a file it is as strong in one place as in another, and is all that could be asked for under the very best welding treatment.—*Boston Journal of Commerce.*

IRON IN ARCHITECTURE.—A paper read by G. Richards Julian before an English engineering society a short time ago, throws such light as indicates the direction wherein cast-iron may be ornamented with fidelity to art principles. The subject seems to be a new one in England, though some advances have already been made in this country toward an artistic treatment of the iron work of buildings. It is one of the canons of art that whatever is false should be avoided; that works to be beautiful must be truthful; that wood must not represent stone, nor cast-iron imitate wrought iron or stone. This general principle was naturally violated when cast-iron was introduced as building material. Mr. Julian in his paper points out some of the ways in which iron may be ornamented without imitation of other materials. Round fluted columns, with Corinthian capitals imitating stone work, have been displaced by columns of a variety of cross sections, and the capitals are replaced by bracket forms suited to the material and wholly unlike anything permissible in stone. The surface decorations of panels has also undergone a change, which distinctly recognizes the nature of the material. It is in low relief, with sharp outlines, and conventional in form. This treatment of iron is in the right direction and will soon give us an iron architecture distinct from stone or other materials and as truly artistic. Utility and adaptation of means to ends lie at the base of all good design and decoration. When iron is structurally treated to give adequate strength with lightness, and the ornamentation required by cultivated people is strictly subordinated to utility and the nature of the material, we shall have done with offensive imitations and the architecture of iron will be as "true" as that of stone.

IMPROVED ENGINES.—An improved construction of locomotive is spoken of with much favor

by engineering authorities, the arrangement being such that while in ordinary engines the gases are usually thrown out of the stack, which is the cause of the density of smoke, in this case the gases are all burned, thus insuring the absence of smoke, which results, of course, in a saving of fuel. Instead of having a large conical smokestack in front, the new locomotive has a straight smokestack similar to those in use on English and French locomotives, in the rear, just in front of the cab. The boiler has two sets of flues, small ones in the lower part and larger ones in the upper. The smoke runs twelve feet through the lower flues, and then returns by the larger flues to the rear, where the smokestack is placed; thus the smoke traverses twenty-four feet before reaching the smokestack, instead of twelve feet, as in ordinary boilers. The heavy cinders and dust, not being able to rise from the lower small flues into the upper large ones, fall into a smoke arch in front, and can be emptied on the ground at any time.

MINERAL OIL IN BOILERS.—In regard to the use of mineral oil in boilers, to which reference was made in one of our late issues, it should be remarked that at a late meeting of English engineers a member spoke of the bad effects of the use of such oil, in substance, as follows: It leaves a residue which is a most effective non-conductor. He had made an experiment to prove this. He placed a quantity of water in a vessel over a fire until the water came to a boil. He then took it off and found he could place his hand on the bottom of the vessel without injury. He then made a solution of the residue of some mineral oil taken from a boiler, and with that solution painted the inside bottom of the vessel previously used. He then again filled it with water and brought the water to the boiling point. On removing the vessel from the fire he found the bottom red hot.

THE INTERCHANGEABLE SYSTEM.—There has been some inquiry lately as to who first invented the interchangeable system of making machinery. It appears that the first use of the system was made in France in 1717, but was not a great success. In this country various efforts were made from time to time to use this system, but the details were not worked out sufficiently to make the system useful. Every one who tried it added something to the perfection of the system, but the man who probably did the most toward its perfection was Thomas Blanchard, whose inventions were used at the United States armory at Springfield. The first complete success under his system was achieved in 1842, when guns were made which dispensed with the old system of numbering and lettering. The interchangeable system rapidly spread to every detail of machinery manufacturing.—*Ex.*

SODA IN STEAM BOILERS.—An exchange says: The best method of introducing soda into the boiler is in all cases to dissolve the soda and introduce it continuously with the feed, which can be done by connecting the vessel containing it with the suction pipe of the pump that supplies the boiler. The proper amount of soda to be used is best found by experience. The usual quantity varies from 1 lb. to 2½ lbs. per day, according to the quantity and quality of the water evaporated. With soda ash a larger quantity will be required, and with caustic soda a smaller quantity. Soda does not act injuriously on the boiler plates, unless the salt is concentrated from the want of sufficient blowing off, or unless the soda itself is impure, and contains acids.

THE SIZE OF JOURNALS.—Maximum efficiency of machinery in which journal friction is the main source of waste of work and energy, is secured by giving the journals such diameter that they will neither twist nor spring under their loads, such length that the load may be carried principally on the lower portion of the bearing, and such form that the "brass" shall not bind or grasp the journal or in any way subject the journal to serious lateral pressures. All lateral pressures due to grasping or binding action decrease efficiency.

WATER IN THE CYLINDER.—For an experiment, Herr Stoupler, of Lucerne, Switzerland, added fluorescence to the water of a steam boiler. The deep green color of the water was retained by it for weeks, and yet no trace of the coloring matter could be detected in the water contained in the steam cylinder, and he accepted this as a proof that the water which gathers there is entirely due to condensation caused by the expansion of steam, and very little water is actually carried over "mechanically" from the boiler by the steam.

ANOTHER ALLEGED FURNACE IMPROVEMENT. Thomas Hunton, of New Orleans, who controls patents by which, it is said, gases generated in the manufacture of iron can be utilized as fuel, is endeavoring to conclude an arrangement with the Birmingham (Ala.) iron men for the erection of a furnace in which his process shall be used. It is claimed this process will reduce the cost of fuel anywhere from 25 to 50 per cent and revolutionize the furnace business.

STAMP DIES.—Prof. Willard I. Pierce, in his address before the American Institute of Mining Engineers, in February, while speaking of stamp mills and their shoes and dies, said: "The adamantite shoes are of chrome steel and have given great satisfaction, the last set crushing over 3,000 tons; the dies are of the same material and weigh 94 pounds each."

SCIENTIFIC PROGRESS.

NATURAL BRIDGE IN ARIZONA.—Frederick Gardner, Jr., a correspondent of *Science*, furnishes that journal with a description and photograph of an interesting natural curiosity, which he recently discovered in Arizona, in the form of a natural bridge. It was guided to it by an Indian, and thinks it was never before seen by a white man. The bridge is located near the boundary between Arizona and New Mexico, and about 20 miles from the point where the Atlantic and Pacific Railroad crosses the line—the account does not say whether it is north or south of the railroad. The bridge forms a section of a ridge, which is here cut through by a small stream, like the well-known Virginia bridge. The section cut through is of dark red sandstone overlaid with grit, of which latter material the bridge is composed. The bridge is sixty-five feet long, fifteen feet wide at its narrowest point; two feet thick in the center, gradually increasing to fifteen at the sides. The light above the bed of the stream is not given, but by the photographic engraving given in *Science*, which shows the explorer's horse standing beneath it, we should judge the height to be about 20 feet. A petrified forest was found a short distance from the bridge. The locality, when better known, will undoubtedly be much visited by tourists. We trust that our cotemporary will give more accurate directions as to its locality, so that it may be readily found by travelers and others.

STEREOSCOPIC EFFECTS BY THE MAGIC LANTERN.—Mr. Crowther, of Manchester, has invented a contrivance for the production of stereoscopic effects by means of the magic lantern. Two lanterns are used, each of which projects one of the two corresponding stereoscopic transparencies so that one picture is superimposed upon the other upon this screen. The light thrown from the lanterns is not white, but consists of complementary colors, red and green. The observers wear spectacles colored of corresponding tints with those used in the lanterns, and each eye perceives only its appropriate view, the mind combining the two pictures into a representation possessing strong stereoscopic relief and some peculiar properties of luster. By a slight alteration in the adjustment the image can be made to advance and retreat, appearing suspended in mid-air between the spectator and the screen, somewhat after the manner of the well-known illusions produced by concave mirrors. The inconvenience of supplying colored spectacles to a company of observers can be overcome, it is thought, by paralyzing each eye, as required, by alternately exhibiting a strong light of the complementary tint required. Mr. Crowther has also in progress a further optical contrivance for intensifying the stereoscopic effect when the landscape is viewed directly.

CHANGES IN LANGUAGE.—The rapid changes which are taking place in the language, the almost daily introduction of new words, largely impairs the usefulness of any but the most modern dictionaries. Look into any ordinary Webster or Worcester, for instance, for the word "altruistic," and it will not be found; yet the word is now as essential a part of the language as any that are in use. And so with hundreds of other words of a philosophic or scientific nature, which have been created to describe new conditions of thought or invention, and, with the hundreds of others that are constantly being adopted from other languages, none of them can be found in the ordinary dictionaries. It is, therefore, satisfactory to note that a commission, composed of President Porter of Yale College, Prof. Ralph O. Williams, Mr. Dorsey Gardner, Mr. Frederic S. Allen, Mr. Lucius Fitch and Mr. Campbell, all men of learning, is sitting daily at New Haven, Conn., preparing a revision of Webster. When their labors are completed, the world will be able to put itself up to the latest date in the use of many words which now present great difficulty.

In science nothing can be permanently accepted but that which is true, and whatever is accepted as true is challenged again and again. It is an axiom in science that no truth can be so sacred that it may not be questioned. When that which has been accepted as true has the least doubt thrown upon it, scientific men at once re-examine the subject. No opinion is sacred. "It ought to be" is never heard in scientific circles. "It seems to be" and "we think it is," is the modest language of scientific literature. In science all apparently conflicting facts are marshaled, all doubts are weighed, all sources of error are examined, and the most refined determination is given with the "probable error." A guard is set upon the bias of enthusiasm, the bias of previous statement, and the bias of hoped for recovery, that they may not lead astray. So, while scientific research is a training in observation and reasoning, it is also a training in integrity.—*Pop. Sci. Monthly.*

ELECTRICAL FIRE BALLS.—M. C. Meigs, of Washington, communicates the following to *Science*: By one who was near its base, the stroke of lightning which injured the Washington monument is remembered as a ball of fire coming towards him. Does not this observation explain the ball of fire so often reported? An electric spark passing between two points, will to a circle of observers, present various ap-

pearances. If two inches long, it will be seen as a line of fire two inches long by some, while to those in the line of its motion it will be a single spark. So when a flash of lightning (a line of fire) is directed toward the observer, it must appear as a ball of fire, motionless if the movement is directly toward the observer, moving with comparative slowness if slightly off that direction, and with electric rapidity if across the field of view at right angles with the line to the observer's place.

GETTING RID OF ELECTRICITY IN MACHINERY.—A correspondent of the *American Machinist* writes to that paper as follows: "Last January, the saws, planers, etc., in the pattern-room became heavily charged with electricity, which at times developed great intensity, and rendered working the machines quite unpleasant, if not dangerous. The pattern room is in the second story, and as live steam is used for heating, the floor was dry as tinder, insulating the machines as completely as if they stood on a glass plate. The frictional electricity from the belts charged the machines so heavily, that sparks one-half inch long could be obtained by presenting the knuckles. To overcome the difficulty, a small wire was driven into a crack in the floor and connected to each of the machines, and to the water pipes, thus allowing the electricity to pass off gradually without acquiring intensity. This plan was perfectly successful, and can be applied in a few minutes."

ARTIFICIAL OIL OF LEMON.—By treating the rectified spirit of turpentine in the following manner curious chemical changes take place: Spirit of turpentine, 2 quarts; rectified alcohol, 3 pints; nitric acid, 1 pint. Agitate the mixture in a glass or earthen vessel and allow it rest. After one month the reaction will be complete, and a large quantity of hydrate of spirit of turpentine is obtained. This hydrate, mixed with alcohol, produces voluminous crystals. Submitted to the action of hydrochloric acid gas, the hydrate of turpentine loses a part of its water of crystallization and is transformed into a hydrochlorate, having all the properties of the camphor of lemon. When heated it loses part of its acid; then treated by potassium, it is transformed into a fluid colorless oil, possessing the odor and chemical properties of the natural oil of lemon.

FORESTS AND TEMPERATURE.—Professor Muttrich, of Berlin, has reached the following conclusion from his forest meteorological researches: That the forest exercises a positive influence on the temperature of the air. That the daily variations of temperature are lessened by the forest, and in summer more than winter. That the influence of the leafy forest is in summer greater than that of the pine forest, while in winter the tempering influence of the pine forests preponderates over that of the deciduous forest. An attempt to determine the influence of the forest on the mean annual temperature led to no sure results.

LIQUEFYING OXYGEN.—Oxygen, it seems, can, after all, be brought to the liquid state under such easy conditions that the experiment is likely to become an ordinary laboratory one in consequence of a recent discovery by M. L. Cailliet. He has found that formene, when slightly condensed and cooled in boiling ethylene under atmospheric pressure, is resolved into an extremely volatile, colorless fluid, which, while again passing to the gaseous form, produces a cold sufficient to cause the liquefaction of oxygen immediately.

A NEW SCIENTIFIC SOCIETY is being formed in New York for the purpose of investigating and sifting the psychical phenomena of man and the lower animals, and of discussing psychological questions. The "Nature and Psychological Relations of Pain" is to be the subject of the president's opening address—a subject upon which he holds, as a starting point, that in general terms whatever tends to undue tissue disintegration and disturbance is a source of non-pleasurable sensation.

THE DRAGON FLY is one of the most peculiar of the winged tribes. It can outstrip the swallow; nay, it can do in the air more than any bird; it can fly backward and sidelong, to the right or left as well as forward, and can alter its course on the instant without turning. It makes twenty-eight beats per second with its wings, while the bee makes 190 and the horse fly 330. The swiftest race horse can double the rate of the salmon. So that insect, bird, quadruped and fish would be his order according to velocity of movement.

NICKEL AND ITS ALLOYS.—Herr Fleitmann, of Iserlohn, has shown that pure nickel and its alloys with copper, cobalt and iron can have other metals added without losing the property of being welded, and therefore can still be used for making plate. The metals which can be added in this way are zinc, tin, lead, cadmium, iron and manganese up to as much as ten per cent.

ROTATION OF THE PLANET JUPITER.—Recent observations on Jupiter appear to show that the period of rotation at its equator is more than five minutes less than in the latitude of the great red spot—a result which is of great interest, as tending to confirm the suspected resemblance of that planet to our sun. That is, that its outer surface, as seen from the earth, is a fiery, nebulous mass of floating matter.

SAN FRANCISCO:

Saturday Morning, Aug. 15, 1885.

TABLE OF CONTENTS.

EDITORIALS.—Professor George Davidson, 113. Passing Events; Mechanics' Fair; Lead Deposits in Limestone; Windmills, 116. Death of James W. Marshall; Terra Furnaces, 117.

ILLUSTRATIONS.—Portrait of Professor George Davidson, 113. Portrait of James W. Marshall; Continuous Terra Furnace for Quicksilver Ores, 117.

MECHANICAL PROGRESS.—Broken Set Screws; A Broken File; Iron in Architecture; Improved Engines; Mineral Oil in Boilers; The Interchangeable System; Soda in Steam Boilers; The Size of Journals; Water in the Cylinder; Another Alleged Furnace Improvement; Stamp Dies, 115.

SCIENTIFIC PROGRESS.—Natural Bridge in Arizona; Stereoscopic Effects by the Magic Lantern; Changes in Language; Electrical Fire Balls; Getting Rid of Electricity in Machinery; Artificial Oil of Lemon; Forests and Temperature; Liquefying Oxygen; Nickel and Its Alloys; Rotation of the Planet Jupiter, 115.

USEFUL INFORMATION.—Comparative Wear of Coin; The Moss Industry in Florida; Utilizing Sawdust; Coating Zinc with Nickel; Patent Pulleys; To Determine the Safety of Coal Oil; To Detect Lead in Culinary Vessels; The Location of Mining Claims—

GOOD HEALTH.—Remember the Skin; A Remedy for Felons; A New Remedy for the Headache; Huxley on the Weight of Man, 119.

MISCELLANEOUS.—Let Us not Mislead Them; Supposed Grand Opportunities; The Republic of Colombia; And the Future—What of It, 114. The American Exhibition in London; Gold in Colorado; Custom Mill Wanted; Location of Mining Claims—Right of Possession, 113. Where Capital could be Invested; Mexican Grants, 119.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 120-21.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 124.

Business Announcements.

Ore Mills.—F. A. Hill, S. F.
 Mechanics' Institute Fair.—S. F.

See Advertising Columns.

Passing Events.

The mining locality just now attracting considerable attention is that of Pine Creek, Union county, Oregon, about 45 miles northeast of Pouker City. Some 60 or 70 locations have been made. The ledges are at an elevation of 5,500 feet above the sea; the country is well watered and timbered, but very rough to travel over. A good wagon road runs within one mile of the camp. The showing thus far, however, is not such as to induce poor men to waste time in going there from any distance.

A company was recently formed to prospect for gold in New Guinea, prompted by the production of a very valuable nugget, alleged to have been discovered in the Fly River valley. Evidence is now brought forward that the nugget was of Australian gold, and the expedition is delayed, pending further investigation. The evidence is strong that a grand swindle was intended.

The season of fairs will shortly commence, and in the various counties preparations are being made. The Mechanics' Fair in this city, the most important, usually, on the coast, will shortly open, all the arrangements having been perfected, and a good exhibition being insured.

In the death of Marshall, the discoverer of gold in California, an historic figure passes from view. A sketch of this well-known pioneer will be found in another column.

Windmills.

There are more windmills in use at the present time than at any other period in the history of the world, and as economical prime movers they are better appreciated to-day than they have ever been before. To place the number of windmills at work in America at several hundred thousand is to give an estimate which those who have been interested in this department of engineering, and who have traveled along the main railroads of the country, must pronounce as low. In some single large cities of the Union over 5,000 windmills are manufactured on an average each year.

Some persons have an idea that windmills are antiquated contrivances, but they have been constantly improved and perfected, and are by no means the cumbersome, unwieldy things they used to be. There was a time when the natural forces of wind and water were the only ones at the command of man for industrial purposes, and when the motors driven by these forces monopolized all industrial pursuits which man did not accomplish by his own physical exertion.

Then came the recognition of the value of steam as a motive power. This was certain to speedily and effectively displace windmills in many places. Though the advent and general application of steam replaced the windmill in many of its strongholds and restricted its use to a few specific purposes, such use has become a very extended one, and will be still further enlarged in the near future, as the true value of the windmill as a prime mover becomes better appreciated, and as electrical storage batteries become more of a success.

For certain specific purposes, and primarily among them for pumping water in moderate quantities, the windmill is not only a thoroughly reliable, but at the same time the most economical prime mover, and, as far as judgment can now be passed, will hold this place for many years to come. The power purposes which windmills are specially fitted to subserve are circumscribed and defined by the character of the motive fluid used. Though the wind may be relied upon to blow with sufficient velocity to drive a windmill to its average working capacity eight hours a day, it is evident there are minutes and hours of total calm.

Therefore the employment of the windmill is restricted to two classes of use: 1st. To work of that nature which admits of a suspension during a calm. 2d. To work where accumulated power can be stored for future use. In a new book on "The Windmill as a Prime Mover," by Alfred R. Wolff (published by John Wiley & Sons, 15 Astor place, New York), three specific applications are suggested under the second heading. The first is that which now claims the extended employment of windmills, viz., for pumping and storing water. A few special adaptations of this use may be mentioned: Water is supplied to country houses and farms, to manufacturing establishments, and to the upper stories of office buildings and domestic dwellings, when the pressure in the reservoir is not sufficient to effect this; railway water stations and tanks are supplied with water, and dry lands are irrigated. Sand has also been raised in place of water, and has been applied to the driving of an overshot wheel.

Windmills can also be used for compressing and storing air, and for driving dynamo machines to charge electrical accumulators. The latter application was first suggested in 1881 by Sir William Thomson. The application of the windmill to this purpose will come actively into play when storage batteries have been developed to a greater success than is attained at the present time.

NEARLY 7,000,000 gallons of water per day now flow from the Sutro tunnel. About 6,000,000 gallons of this vast aqueous output is lifted by the splendid hydraulic pumps from the 3,100 level of the Combination shaft to the 1,600 level, where it is turned into the big tunnel.

THE tunnel at Big Bend, by which the Feather river is to be turned, is now in 10,000 feet; it is to be 11,200 feet in length, and will dry the bed of the river for 12 miles. It is expected that very rich diggings will be developed.

CALICO mines, San Bernardino county, in this State, have shipped so far this year \$1,566,681 in bullion.

The Mechanics' Fair.

We are assured that the prospects for the Mechanics' Fair, which will open Aug. 15th, could not be better. Enough space is already taken to fill the Pavilion comfortably. The southern counties particularly seem disposed to make good displays of their productions and resources. San Diego, San Luis Obispo and Ventura counties are especially considering the matter, and the latter county has engaged space. In the north, parties in Napa and Solano counties are taking great interest in the agricultural features of the fair. Mr. C. F. Bassett, one of the trustees, who is traveling in the southern part of the State on business of his own, writes very encouragingly of the interest taken by the people of the southern counties, and thinks there will be a particularly good exhibit from that part of the State.

There has never been as good an exhibition of dairy products as ought to be made by such a State as California. All the fairs have been unfortunately deficient in this respect. The cool climate of San Francisco is especially adapted to such an exhibit. Dairy products make a handsome show if taste is displayed in their arrangement, and as the managers of the fair have invited a special exhibit of this character there should be dairymen willing to embrace the opportunity and make a good display in butter and cheese.

There is a great deal of interest taken in the floral exhibit this year, and a prospect of an unusual display, exceeding last year and every previous year. The machinery department is well filled. The art gallery is to be very fine and full, as the entries for space show. One of the special features of the fair will be a large Bergstrom organ. It will be the largest organ ever put up in the fair and will be finished in all its parts. Last year the instrument, owing to lack of time, was not as complete as intended. There will be an organ recital three or four times a week, which will be very attractive. It (the organ) is one of the largest in the city.

A new hoiler is to be put in, and there will be 40 per cent more available steam power than last year, and 50 per cent more power can be obtained if necessary. It has been decided by the directors that any person under 21 years of age, who is actually engaged in learning any trade, will be entitled to be admitted to the exposition at apprentice's rates for \$1.50 a season ticket. The Institute will furnish each applicant, for reduced rates, with a blank certificate, which will have to be filled out by the applicant's employer.

There has been some discussion as to the last method of accommodating the public school children at the fair. There are in this city 42,000 school children, besides many from Oakland and Alameda, who will attend. It was at last decided to issue invitations to the Board of Education for the children, and make the request that it be so arranged that classes and schools be admitted every morning under the guardianship of the teachers. Heretofore the children have thronged the building in the afternoon, and have roamed around in great disorder, to the annoyance of adults.

The managers earnestly request choice exhibits of fruit, green and dried. There will also be an attractive and instructive wool exhibit. Contributions both of wool and mohair will be gladly received and prominently displayed.

The importance of the Mechanics' Fair as a means of bringing our products before the eyes of many people should not be forgotten. The city is the point to which the eyes of all tourists turn, as well as the multitude of our own people who come here during the month of duration of the fair. The attendance daily is said to be from ten to fifteen thousand. Certainly all these people should have an opportunity to see our fine fruits, grains, dairy and other farm products, as well as the attractive displays of manufactured goods and merchandise. There is still time to prepare creditable exhibits, and we hope it will be done by all who have confidence in the results of their own work and desire to add to the good opinion which visitors get of the State. Mechanics and manufacturers should aid as far as possible by making good exhibits, so it is a very easy way to bring articles to the direct attention of thousands who buy.

The opening exercises will take place in the Grand Opera House at 2 o'clock Tuesday, Aug-

ust 25th. H. C. Dibble will deliver the oration. Miss May F. Cooper will recite "The Forging of the Anchor." The program is not yet complete, but with what talent is already secured, the exercises will be very interesting.

Lead Deposits in Limestone.

The type of ore deposits to which those of Eureka district, Nevada, belong, is one often met with in the older limestones of the Great Basin, and although these particular deposits have been of more value, and are more widely known than any of the others, and exhibit some very interesting structural features, they cannot be said to form an isolated class. Although the gold and silver in the Eureka ores are the metals which render their mining possible, yet the quantity of them present in these ores, measured by weight, is so small, in comparison with the lead, that a classification based on these metals alone would be misleading. As in many of their features they resemble other lead deposits in limestone, it seems best to regard them simply as lead deposits in which the gold and silver are merely accessory, though very important ingredients. All lead ores carry some silver, and with it some gold, though in many of these it is only possible to obtain traces of these metals.

Throughout the Great Basin there are a large number of lead deposits, all of which exhibit many features of similarity. In Mr. J. S. Curtis' monograph on the "Silver Lead Deposits of Eureka, Nev.," he states that they occur in limestone and dolomitic limestones of Paleozoic age, and are mostly of very irregular form. Their ores consist principally of argentiferous galena with antimonial and arsenical combinations and pyrites, and the decomposition products derived from these minerals. Compounds of copper, zinc and other metals occasionally accompany these ores. In by far the greater number of instances the oxidation has been carried to a great depth, sometimes reaching or exceeding 1,000 feet. The extent of this oxidation is in a great measure due to the absence of any large quantity of water until considerable depth is reached. The characteristic gangue of these ores is the hydrated oxide of iron, with more or less calcite. Quartz is rarely found in any great quantity, except where the deposits occur in the form of contact lenses between limestone and porphyry, the quartz being probably derived, Mr. Curtis says, from the decomposition of the porphyry. An example of such lenses is offered by the 2 G mine, in Tybo District, Nevada. It is found to be more profitable to reduce all these ores by smelting than by any other process. Among the principal districts where such ores are found may be mentioned Eureka, White Pine and Bristol, in Nevada, Cerro Gordo, in this State, and Ophir, Big Cottonwood and Little Cottonwood, in Utah; all of which occur in Paleozoic rocks.

THE product of the Plymouth Con. mine, Amador county, for June is reported officially at \$82,656.70, making the product for the six months ending with 30th June, \$493,607.65, or a monthly average of \$82,267.94. The operating expenses of property aggregated \$160,792.84 for the six months, being a monthly average of \$26,799. The profit for the half year was \$332,814.81, which, added to cash left over on 1st of January, 1885, made the sum disposable for dividends \$407,109.87. The six dividends paid this year, aggregating \$300,000, together with \$10,914.86 expended in constructions, left a cash balance of \$96,195,000. The stockholders of this company have already received \$13 per share in the form of dividends. The introduction of water for power, together with economical management, have reduced operating expenses to a minimum. The figures show a gradually increasing surplus after payment of the usual dividend of \$50,000 each month.

RICH RASCALS CORRALLED.—It has been the claim that only the poor were punished for crime while the rich went free. This is too often the case, but it is a satisfaction to know that there are notable exceptions to the rule. In New York two wealthy and prominent citizens, Fish, the late president of the Marine Bank, and Buddensheik, the wealthy real estate owner, have been sent to the penitentiary for terms of ten years, Fish for stealing the Marine Bank dry, Buddensheik for erecting buildings of such rotten materials that they collapse and kill and maim their occupants. It is to be hoped that the punishment of crime, irrespective of the wealth or social position of the criminal, will become general throughout the country.

Death of James W. Marshall.

On this morning of the 10th inst., James Wilson Marshall, the discover of gold in California, was found dead in his bed in a cabin he had long occupied at Kelsey's Diggings, El Dorado county. From anything that appears to the contrary, he was in his usual health up to the night of his death; wherefore it is probable that he was carried off by heart disease, an attack of apoplexy or something of the kind. He was nearly 73 years of age at the time of his demise, having been born in the month of October, 1812, his birthplace being Hope Township, Hunterdon county, New Jersey. He has been buried on an eminence overlooking the town of Coloma, near the site of Sutter's saw-mill, in the race of which the first piece of gold was picked up. This locality chosen for the interment of his mortal remains, selected by himself, is a fit one, seeing it was here the great event of his life occurred.

By the death of Marshall, one of the most notable characters connected with the gold era of California, and a historical figure of the times in which he lived, has been removed. Next to General John A. Sutter, he occupies the most conspicuous place among the California pioneers, who will ever cherish his name both for the many sterling virtues of the man and the memorable event with which it is so intimately connected.

James W. Marshall died, as for the greater portion of his life he had lived, a very poor man, having belonged to that class of persons who, however favorable the conditions, never get rich. Why this is so cannot always be explained. Generally speaking, this unfortunate class of individuals are deficient in some of the elements of business success, such as prudence, stability, economy, etc. Just what was the matter with the subject of this sketch we do not know, other than that he seems to have been without the acquisitive faculty; then, too, he was generous, given to acts of hospitality and prone to share what little he had with those in want—qualities that, joined with his inability to accumulate, were quite enough to keep him constantly poor. He did at one time own a comfortable home at Coloma, with a vineyard which, being planted to choice vines, possessed some value. But having parted with this he was never after the owner of anything more than a bare cabin like that in which he died.

It was unfortunate for Marshall that he came to be possessed with the idea that the world, and especially California, owed him a great deal. That this debt was not discharged, nor always even acknowledged to the extent he conceived to be his due, chafed him not a little, and so soured his disposition that he became at last somewhat querulous and misanthropic. The State of California did allow him a small pension, which, having been limited by law to a few years, at the end of that time ceased and was never renewed. It was a pitiful sum, anyhow—just enough to wound the recipient's pride without being of much benefit to him. In the case of both Marshall and Sutter, California has laid herself open to the charge of meanness, if not ingratitude, in refusing to grant these men a decent subsidy in consideration of the service they rendered the public. Far better would it have been for both had not an ounce of gold ever been found in the country, since in that event they would have retained the lands they once possessed, and been saved the humiliation and hardship of dying homeless and poor. As for Sutter, though perhaps in some things a little indiscreet, he had, by his boundless hospitalities to the early immigrants and the splendid services rendered in the conquest of California, established such claims upon both the general and State Governments as should have secured to him almost anything he requested at their hands. As regards Marshall, he was, of course, entitled to less consideration, yet the State might, as a matter of policy, have done enough for him to save itself from the stain of reproach: the world pointing to the case of Hargrave, the discover of gold in Australia, and contrasting the munificence of the Imperial and Colonial Governments with the niggardness of ours.

Some of the stories related about Marshall, and one or two of which are now being repeated on the occasion of his death, are at least apocryphal if not wholly without foundation. For instance, what is said about people

persecuting him with a view to forcing disclosures of rich diggings, of which he was supposed to have had a knowledge that he selfishly kept to himself; also of his having been dispossessed of a large tract of land by the squatters, etc., all of which are sheer fictions. He never was the owner of or claimant to any large tract of land, wherefore it could not have been wrongly

James W. Marshall.

wrested from him. As to the story of his having had any knowledge of rich diggings that he refused to reveal for the benefit of others, that was still more absurd. Marshall, though the discoverer of gold, was not much of a prospector, having never gone far from Coloma in search of

ing gotten his mill started, he would have gone on making lumber, from the use and sale of which, being in this business a partner of Sutter, he would have, in the course of a few years, realized a competency. This accomplished, he would, following the ordinary course of events in those halcyon days of California, have applied to the Mexican Government for and obtained a large grant of land, to which he would have retired, and, becoming a raiser of stock, would have lived in comfort and independence, and died, lord of many acres and owner of cattle upon a thousand hills.

Tierra Furnaces.

At the New Almaden mine, in this State, the "vein matter" is run out in ore cars on an elevated tramway above the dressing floor belonging to each center of production. Beneath these tramways, at convenient intervals are placed har-screens, inclined at 45°. The bars, slightly chamfered at the bottom to prevent choking, are placed an inch to an inch and a quarter apart. To prevent spreading they are stayed with iron cross-hars at intervals of four inches. Their total outside width is five feet. Upon these screens the ore is dumped, and what passes through is known as *tierras*. The coarse fragments which fail to pass the screen are carefully examined, and any lumps that show signs of cincharr are broken by hand to a maximum diameter of nine inches and the waste is rejected. This picked ore is known as *granza*. There is a great deal of this fine ore, or *tierra*, about half the ore worked using of that character. Special furnaces known as *tierra* furnaces, are used to work this fine ore. Engravings of a continuous *tierra* furnace are shown on this page. It was described by S. B. Christy in a paper on "Quicksilver Reduc-

rests at either end on rollers running on T rails, at right-angles to its length. Each of these aprons is connected with a lever-arm outside of the furnace, by means of which a gentle oscillating motion may be given to it.

When the apron is in its central position the foot of the ore column rests upon it, and runs out at its natural slope to each edge of the apron, and the whole ore column in the chamber above is maintained in equilibrium. As soon, however, as an oscillating motion is given to the apron, the ore resting upon it is discharged in a shower from either edge of the apron into the ear beneath, and the ore in both chambers, from bottom to top, descends.

It will be noticed that the partition-wall in each pair of ore chambers rests upon a hollow cast-iron girder. As originally constructed, the space below this girder was entirely free to the passage of ore from either chamber. But, with this construction, it was found that, in discharging the ore either chamber of the pair got the start of that in the other, the velocity of this descending ore on that side would be great enough to impede the discharge from the other side. This difficulty was obviated by Mr. Randol, who introduced a vertical iron plate bolted on to the middle of the hollow girder. In this outside pairs of chambers these plates reach to within three inches, and in the middle pair to within five inches of the discharge-slits. This improvement entirely obviated the difficulty, and the discharge of this furnace is now effected with perfect ease and regularity.

In the setting of this tile shelving in this furnace, the tiles are of peculiar shape, and were made to order for the furnace at Staten Island, N. Y. Those for the *tierra* chambers were made 20.7-16 inches wide on the upper face, while those for the *granza* have a width of only 18.7-16 inches. Both are three inches

thick. All of them were made with a square lug or shoulder, 5½ inches thick, and forming an angle of 45° with the face of the shelf. The width of the lugs on their upper face was made 4.9-16 inches, or 6½ inches, according to the thickness of the partition-wall between the chambers. The wall between each two pairs of ore chambers was made 13½ inches thick, and between the two chambers of each pair only 9½ inches. Two shelves, projecting into adjacent chambers, are set with their shoulders abutting against each other, allowing for ¼-inch to ½-inch joints. Consequently, the shelves form an integral part of the partition-walls. Beneath the shoulders of the two shelves is set another tile, also 5½ inches thick. This has the form of a frustrum of a wedge, whose faces are at right angles to each other. This tile also forms an integral part of the partition-wall, and projects out into either chamber so as to support the shelves from beneath for half their width. Beneath the supporting tiles are four tiers of fire-brick, then the next pair of abutting shelf-lugs and their supporting tiles, and so on. The ore chambers are 22½ inches wide, and the shelves in each wall are 21 inches apart vertically. This method of setting has given good results, but the method now used in the latter constructions is to be preferred on account of cheapness and simplicity.

In this furnace the fire-place is placed five feet above the discharge-opening, and the air to supply the fire is drawn through the hot ore below the level of the grates, so that the ore reaches the apron free of fumes, and cooled to such a temperature that it may be easily handled.

This furnace is entirely enclosed by a sheathing of heavy iron plates, bolted and cemented, with rust-joints. The arrangement of this sheathing and the distribution of the peep-holes is shown in the elevation.

The normal capacity of this furnace is 36 tons. The furnace holds, when under working conditions, 51 tons of ore; a charge is, therefore, 34 hours in the furnace.

The routine of operations at this furnace is as follows:

The aprons or shaking-tables under each of the three pairs of ore chambers, are operated at intervals of 10 or 15 minutes, so as to discharge from each one ton (by volume) every two hours. After the ore has descended in the various chambers, subsequent to discharging below, one ton of ore is added to each of the three ore-hoppers at intervals of 40 minutes, i. e., each hopper receives 1 ton every 2 hours. The firing and tramping of the spent ore goes on meanwhile as at the other furnaces.

The fuel required at this furnace is 2½ cords of wood per 24 hours, if that alone is used; but, if coal is used, the amount of wood is reduced in proportion. The working force is: Two men, at \$2.50 per 12-hour shift; one man, at \$1.25 per 12-hour shift.

SECTION A B and part of side elevation.

SECTION D C SECTION E F and part of front elevation.

CONTINUOUS TERRA FURNACE FOR QUICKSILVER ORES.

new diggings. The bar at Coloma, though extensive, was not extremely rich. The miners working on it even as early as '48 averaged not much over one ounce per day to the man, the average earnings in '49 having been considerably less, while from that time on till the bar was worked out, five or six years later, the average wages made were quite moderate. It is, therefore, evident that, as the old pioneer never made any very big raise at that place, so neither could he have had any knowledge of rich deposits there, as very likely he had no knowledge of any elsewhere.

The truth is, the great gold find at Sutter's Mill proved altogether a misfortunate event for Marshall. It lifted him above himself and his surroundings, caused him to lose his equanimity, and, so to speak, let go his grip on the small and certain, and grasp to the grand, distant, and, as it proved in his case, unattainable. But for this untoward incident it is easy to see what sort of a life he would have led, and how he would probably have fared in the end. Hav-

tion at New Almaden," read before the American Institute of Mining Engineers.

Furnace No. 3 is shown in section and elevation in the engraving. It has three pairs of ore chambers, placed side by side. The two outer pairs of ore chambers for roasting *tierras* have three-inch shelf-slits, while the inner pair, originally intended for *granza*, have five-inch shelf-slits. They are now all used, without alteration, for roasting *tierras*.

The discharging arrangements were as follows: Beneath each pair of ore chambers a discharge pit is arranged to contain the "slag" cars, which are run in from a track on the floor of the works. The whole furnace rests on the usual inclined cast-iron plates, in which are discharge slits for each pair of ore chambers; the outside ones are three inches and the middle one is five inches wide, and they run the whole length of the ore chambers. Immediately beneath each of these slits is its discharge apron. This apron is a cast-iron girder, flat on top, and three times as wide as the slit above it. It

The American Exhibition in London.

A Novel but Effective Way of Promoting Trade.

The exhibition to be held in London next year will furnish a new departure in the history of exhibitions. It will be opened May 1st, 1886. It will not be international in any sense of that word, and yet it will be held beyond the limits of the territory of the nation in whose interest it has been projected. It will be a purely American exposition held in London, just 101 years after John Adams presented his credentials as the first American Minister from the United States on a friendly mission to the mother country. It will be the first exclusively American exhibition ever held in Europe—and the first exhibition of the exclusive products of any one country ever held within the limits of another.

It is a bold as well as a novel project. The idea of thus demonstrating, in the midst of the greatest and busiest mart of the Old World, the progress made in the pursuits of art and science by the principal nation of the Western Hemisphere—a nation scarce a century old—is worthy of the energy and enterprise of our people. There is probably no other nation on the globe that could attempt it with any hope of reasonable success.

A Purely American Idea.

It is obvious that an exhibition held in the British metropolis, and exclusively devoted to the arts, inventions, manufactures and products of a single foreign country, could not be initiated by the Government of that country. Private enterprise alone must have initiated and set on foot such a project. The United States Government has not been invited to extend any subsidy to it; all that is expected of the Government is that it will add interest by contributing a choice selection of the products of Government works and of its collections.

A very large number of our heaviest manufacturers, merchants, inventors, artists and producers of every name, have taken hold of the matter for their own and the nation's interest and honor. The products of the New World will simply be placed on exhibition for the examination and criticism of the people of the Old World.

The advantages to be hoped from such an exhibition are manifold. The friendly relations between the two countries will be strengthened; American inventors, manufacturers, and producers will have for the first time an opportunity of presenting to Europeans the many improvements made during the past half century, while visitors to the exhibition from all parts of the Old World and its colonies will carry away valuable lessons on the improved modes of production stimulated in America by the dearth of labor.

The opinion of the United States consuls throughout Europe upon the importance of the exhibition has been most emphatically expressed in the affirmative. The United States Government and the governors of all the leading States are also unanimous in their approval of the scheme.

The Great Advantage

Which America possesses over all other nations, by reason of the variety of her climate and soil, in the possibilities of diverse productions, has never yet been properly brought to the attention of other nations, and cannot be, under the necessary disabilities of international exhibitions. America herself, and alone, can, of her own productions, present almost as full and complete a variety of exhibits as is usually found in a world's exhibition. This is a fact which cannot be properly brought out and made manifest in the mass of material always shown at an international exhibit. So far as the show is concerned the proposed exhibition at London will be, in its variety, if not in its extent, an international exhibit. Almost everything will be there shown which could be collected by the united efforts of all other nations—thereby showing in a most effective manner the great and wonderful variety of our natural productions.

The Grounds Selected

Will be in communication with 14 different lines of railway. It is stated that about ten millions of people reside within one hour's ride of the proposed American Exhibition Station, in addition to 150,000 strangers, who, it is estimated enter the city of London daily. The exhibition will be

Unique in Its Make-up

As well as novel in its conception. It is proposed to arrange the entrance hall so that the European visitor shall take leave of his native soil, and shall temporarily be in, and commence his visit to North America from the harbor of New York, with the Bartholdi statue of liberty, and the striking features of the eastern entry to the United States, around him.

On leaving New York harbor, the visitor's first excursion will be through the various States across the continent to San Francisco—from the Atlantic to the Pacific seaboard. He will have the opportunity of inspecting collections illustrating the wealth and civilization of the entire country from east to west, north to south.

The railway routes and the picturesquely diversified scenery of the agricultural, pastoral, forest and mining States will be illustrated by

paintings, maps and products. The material resources and characteristic social conditions of the various parts of the vast territory extending from ocean to ocean, and from the lakes to the Gulf of Mexico, will thus be exposed to view, and offer exceptional facilities for comparison.

The condition of the respective agricultural, grazing, mineral and manufacturing localities will be particularly shown, and in a manner which will be intelligible and interesting to all; whilst the state of development and the undeveloped resources of the various sections will be brought under the visitor's notice in such a form as will enable him to establish a trustworthy basis for judgment as to their respective advantages.

All the principal phases of American life, from the parlor on Fifth avenue in New York, or a broker's office on Wall street, to the camp fires of the miners in the Sierra Nevadas, will be shown, and the wild Indian in his native trappings with the buffalo and bear, will be there, as well as his industries in the way of canoe-building, mat and blanket weaving, hide tanning, etc. The trapper's art and life in the wild regions of the Rocky mountains will also be shown.

A separate building will be devoted to our exotic products and labor—the handicrafts pursued by Mongolian workers and their mode of life, etc. The colored man will also be there, with all his peculiarities of labor, and life and song.

The United States Government will send a most unique collection to be contributed by the Patent Office, the Smithsonian Institute, the Agricultural Department, the War Department, etc.

Among the members of many representative associations, a celebrated American regiment, with its band of skilled musicians, and an American fire engine corps, are expected to pay a visit to London during the exhibition. Their arrival will be made, if possible, to coincide in date with the Wimbledon meeting and the military tournament, in order that the volunteer military services of the two countries may meet together on a friendly footing, worthy of the feelings of mutual esteem which characterizes the present relations of the two kindred nations.

There will be organized, in connection with the exhibition, such sports as may be practicable, including roller-skating, baseball playing, lacrosse, trotting matches, cycling tournaments, billiards, and the American variations of every form of recreation which is popular in the Old Country.

Our Labor-Saving Inventions and Machinery.

Will form a most conspicuous feature. Our elevated and cable railways will be shown in a practical way. Our mines and the methods of working them, also our oil wells and their peculiarities will be shown. Our immense industry of stock-raising, and our unlimited timber resources will be shown by plans, by figures, sketches and paintings, and in such a manner as to give something like an adequate idea of our immense resources in those directions. In short, the entire exhibit will make a display, national and representative, in the fullest sense of the words.

Approved by Our English Friends.

We learn from an English journal that the entire plan of the exhibition meets with the most cordial approbation of our English cousins and continental friends. As a most emphatic evidence of this it is stated that Englishmen and other Europeans will organize for the opening a "Grand Council of Welcome," for the purpose of extending the right hand of fellowship to greet, in the most cordial manner, their "kith and kin from beyond the sea," and to show a manifest approval of our laudable effort to exhibit to the Old World the gigantic strides which the leading nation of the New World has made in the broad fields of material progress.

As a further evidence of the cordial good feeling shown towards the exhibition, it may be added that arrangements are being made, under which a delegation of the Freemasons of England will appear at the opening ceremonies to receive and join hands with a similar delegation from the Order in America.

Other societies will also appear, to whom the corresponding English societies have already cordially offered hospitality and the use of their respective headquarters.

All these expressions of approval and friendship may be regarded as a public recognition of the joint standing of England and America as the representative people of the world; speaking one language, and imbued with almost identically the same political and social aspirations. This exposition, more than any one which has preceded it, will, no doubt, serve to stimulate and give expression to the desire which so universally prevails in both countries for a more intimate knowledge and appreciation of each other.

This exhibition will, moreover, present one of the most valuable, instructive and entertaining which has ever been held in any part or in age of the world, and will no doubt accomplish more for material progress on both sides of the Atlantic than any other movement of any kind which has ever before been set on foot.

The mineral product of the United States last year was valued \$413,104,620. This was about \$3,000,000 less than in 1883, caused by lower prices than the decrease of output.

Gold in Colorado.

Those mining sections of Colorado, where gold is the principal product, are strong advocates of silver coinage. The Breckenridge Journal thus represents the sentiments of the people of that gold camp:

Now that the discussion throughout the world is whether silver shall be continued as one of the monetary metals or not, it is a source of satisfaction to know that an adverse decision can work but little injury to this immediate locality, while every resident of Summit county is not only friendly to silver, but a positive advocate of its continued coinage and are willing to labor for its equality with gold. Yet it is well known that the great wealth of this region depends more upon the gold product than upon its silver veins.

During the years when silver and carbonates were the object of every delver in this section, it was a notorious fact that the total value of the whole output for the season did not equal the monthly shipments of gold now quietly leaving for Denver. Where it took a huge freight-car to transport a few hundred dollars' worth of cheap ore, it now requires but a small package no larger than a pound of sugar to carry away \$1,000 worth of gold, hence the outward show is less, while the value is vastly greater.

The prospects for a continuance and a vast increase in the production of gold are all that could be desired. On Gibson more openings are being made daily, and those opened are being developed, and in no instance has any falling off in quality or pinching out in quantity been observed.

The Lincoln properties and the Swan properties are developing bonanzas in a score of openings, and last Nigger hill, clear to the foot of Baldy, is coming with its contribution of gold. The Laurium, a well-known gold-producing property in days gone by, has been for years a non-producer because of bad management and litigation, but beyond that, in the same neighborhood, good properties have lately come out with paying gold-bearing rock. The Mountain Pride, at the foot of Baldy, worked by Bacon, Winslow and Bush, had a run of three tons put through at the Wiswell mill this week, which left a yield of something over two ounces of gold to the ton. While not a large yield, it shows the presence of gold in that vicinity in paying quantities. As the placers on the foothills of Baldy were exceptionally rich, it is evident there must be feeding fissures on the mountain, which time and industry will develop. The few heavy veins of low grade silver bearing ores are of value, still they do not compare with what this camp has a right to expect from its gold-producing property.

Custom Mill Wanted.

The Shasta County Democrat says: What is needed more than anything else to assist in encouraging and further developing the mining interests of this county is a custom mill and smelting works, located at some central point on the river, where miners and prospectors on both sides of the stream could haul their best ores easily and have them crushed. We can think of no enterprise that, at present and for some time to come, would be more advantageous and beneficial to all concerned. To illustrate: On the east side of the river in the Old Diggings and Buckeye districts there are many claims held by poor men, who, if they had some way of realizing ready money from the best ore they can take from their several claims, would enable them to further prospect their property as it should be prospected, and also give them extra money besides. With this help, we know of many fine-looking prospects that would soon be developed into good property, whereas at present they are worth but little to their owners and the country at large. The cost of a plant for such milling and reduction works as would be necessary for the time being would not cost near as much as the saw-mill to be erected here, and we are confident would be of as great value to the county.

The moment small works of this kind are started here the mining industry of this county will hound forward and the whole county in a very short while realize its beneficial effect. Nevada and Placer counties would be nothing to what they are to-day were it not for custom mills which enable the miner and prospector, who are not able to erect milling machinery, to realize ready money from their ores. Redding would be a central point for a small custom mill, smelting and chlorine works. Those who have noticed are aware that many tons of rich ore and sulphurets have been shipped from this county to places where such works are located. This could be averted, and the county and all concerned would be greatly benefited were such works of a small capacity erected in the vicinity of Redding. Our county is rich in ores that would handsomely support and make exceedingly profitable such an enterprise, and we can think of no movement that more earnestly demands serious consideration by our citizens. With such help, where there is one miner now laboriously eking out an existence, a hundred would be prosperous and making money. Sober thought upon this subject we guarantee will soon convince any one at all familiar with the mining industries of the county that what we say in the above is true.

Location of Mining Claims—Right of Possession.

The Supreme Court of California—in decision 5, June 3d—in the case of Horswell vs. Ruiz, held as follows: "The instructions given at the request of the defendants, in some instances, contradict those which were given at the request of the plaintiffs. For example one instruction, given at plaintiffs' request, reads:

"You are instructed that if a party goes upon the mineral lands of the United States, and works thereon, without complying with the requirements of any law, either Federal, district, or local customs, and relies exclusively on his possession or work, and a second party locates peaceably a mining claim covering the same ground and in all respects complies with the requirements of the Federal and district mining rules, laws and regulations, then such second party is entitled to the possession of such mineral ground as against the party in prior possession, who is from the time said second party has perfected his location and complied with the law, a transgressor."

"At the request of defendants, the following instruction to the jury was given: The jury are instructed that, independent of any mining laws or customs, a party who first takes possession of an unclaimed mineral lode for mining purposes, may hold the same by actual work and occupation, to the extent of such work and occupation, as against all the world, except the paramount proprietor, provided that he neither claims nor holds in excess of that to which he would be entitled by virtue of a compliance with the mining laws."

The Court decides that "The law is correctly stated in the one first given," and cites as authorities *Morenauht vs. Wilson*, 52 Cal. 263; *Chapman vs. Toy Long*, 4 Sawy, 28; *McCormick vs. Varnes*, 2 Utah, 355; *Belk vs. Meager*, 104, U.S., 284; and *Hopkins vs. Noyes*, 4 Mont. 550.

Boundary of Claim.—The same court and in the same case cite the decision in the *Eureka* case, 4 Sawy, 302; in which Judge Field, delivering the opinion, said:

"The provision of the statutes of 1872, requiring the lines of each claim to be parallel to each other, is merely directory and no consequence is attached to a deviation from its direction."

From the above decision on those conflicting instructions, miners will observe that mere naked possession, work, and occupation of claims, without complying with location laws, will not hold, as against subsequent locators of the same ground, who do comply with those laws.

SALTING MINES IN BRAZIL.—We have often heard, says the *London Mining Journal*, of attempts made by dishonest persons in different parts of the world to float worthless mines, at the same time issuing elaborately-conceived prospectuses. But we do not always hear honest persons publicly exposing these attempts. It was in every respect satisfactory to hear a speech at Levant meeting, made by Captain Henry Eddy, of St. Just, who has just returned from an inspecting tour in various parts of the globe, a speech which, moreover, cannot but prove interesting reading. Captain Eddy gave it as his candid opinion, that assertions of the discovery of lodes were often fraudulent, that the specimens shown were imported, that it was said the specimens came from certain lodes, whereas they had never been broken within 100 miles of the place. Very suggestively, at this observation, two gentlemen ventured to say such things had been known in Cornwall, and even in St. Just. Following this, Captain Eddy furnished this incident, which has occurred recently. This gentleman was in Brazil. He went to inspect a concession; there were pits dug here and there, and the concession it was proposed to sell to an English company for £100,000. Coming down from the mine, and walking in single file down the mountains, gold was placed by some one with the specimens he had taken. He afterwards informed those interested that he had discovered what had been done. At the second inspection he detected that gold had been brought from some other source, and he also made this known. But the others were not to be outdone. It was suggested to Captain Eddy he should await in the morning until the "men got their holes in." The inspector agreed, and upon reaching the spot found the holes charged, and that the men were about to fire. The blasting done there was plenty of gold to be seen. Captain Eddy counted twenty specks on one stone. He removed three of these with his thumb, and with his pen-knife four others. He told the chief person the gold was not in the stone. He said nothing just then to the other people about; these were interested, and he had a lonely journey of six days before him. The explanation of the gold on the surface of the stone, at the final inspection, was that the gold had been placed in the hole, and the force of the dynamite charge had blown the gold along the faces of the stones. Truly the ways of some company-floaters are mysterious.

The electric light has now been in use at a considerable number of mines in Europe long enough to demonstrate its value.

It is now conceded that the majority of mineral bearing lodes are formed either by sublimation or infiltration.

Where Capital Could be Invested.

The continued stagnation of idle capital appears to indicate that there has been no marked improvement or advancement made by those controlling large sums of money. While capital has the reputation of being conservative, the history of events proves its dullness of perception, and its inability to grasp, in advance of a general movement, important points of advantage. Let the tide of investment turn in any given direction and thousands and millions of dollars are poured thoughtlessly and recklessly and unreasonably not to secure some fancied advantage or benefit, where reason clearly indicates that there is no substantial basis of realization.

A season of general activity for a time appears to prevail, in which capital seeks the most absurd and ill advised adventures, and is easily lured from its hiding place, even over a pathway which is marked by misfortune and disaster. On the other hand, when a reaction comes, ending in a general depression of business, the most inviting propositions, based upon the most substantial assurances of a steady and generous return, are considered calmly and indifferently, while opportunity after opportunity, in which there is every assurance of safety and security, is passed by unimproved.

In the early history of mining enterprises a piece of gaudily printed stock was sufficient to secure money without investigation, examination or knowledge of the basis upon which the stock was issued. Millions of dollars have been paid for these stock certificates, and in many instances representing no tangible evidence of value, present or prospective. Capitalists were eager to exchange their money for these painted hubbles, which, in thousands of instances, were based on six location stakes, where there was not even a semblance of a mine within miles of the locality designated. At the present time the scene is vastly changed. Years of steady and unremitting toil have pushed down shafts hundreds of feet throughout the mineral belt of the country, and demonstrated to a certainty the character, quality, value, cost and profit, and all the important factors entering into a demonstration of the real basis of the mining industry. In many cases the amount of ore actually in sight is greater than the amount asked for the mine. In other instances the work of development, the acquired facilities and the demonstrated value of a property, as a producer, is equal to the amount demanded for the same. These opportunities are presented in hundreds of mining camps, from one end of our mineral bearing territory to the other, yet capital turns a deaf ear and is dead cold to every opportunity presented. In addition to this important advantage, these years of experience have furnished a class of qualified and thoroughly responsible experts, upon whose judgment millions may be safely invested.—*Mining Review.*

Mexican Grants.

Those familiar with the notorious public history of land titles in this State, need not be told that our people coming from the States east of the Rocky mountains, very generally denied the validity of Spanish grants, and their proper limits or location, and determining the rights of holders for themselves, selected tracts of land wherever it suited their purpose, without regard to the claims and actual occupation of holders under Mexican grants, with a view of acquiring pre-emption rights and title under the United States at some subsequent period. Many of the older, best authenticated, and most desirable grants in the State were thus, more or less, covered by trespassing settlers. When the claims of Mexican grantees came to be presented for confirmation, these settlers aided the United States, the most formidable opposition usually coming from them, first to the confirmation of the grant on every imaginable ground, of which the most frequent was fraud in some form, at some stage of the proceedings. When confirmed, and the officers of the government came to the location, the contest became still more vigorous and acrimonious—the trespassing settlers or adverse claimants under other grants, seeking to have the confirmed grant located so as not to interfere with their claims or interests. One body of settlers or claimants would seek to move the location in one direction, and another, for similar reasons, in another.

Thus the opposition to confirmation and location, from trespassers and contesting claimants, was more violent than the contest between the government and the petitioners for confirmation. Charges of fraud are easily made, and they were by no means sparingly made by incensed defeated parties, and these reckless charges by disappointed trespassing and opposing claimants in many instances, involved the officers of the government as well as the claimants under the grant.

These were the matters most embarrassing to the tribunals and officers appointed to adjudicate them. It is not improbable, that more or less frauds were committed in some of the many grants confirmed. In a recent decision of the Circuit Court of the district of California, the Judge said that it is far more conducive to the public interest and public peace, as well as to private interests, that they should, pass unpunished, than that this kind of acrimonious litigation should be indefinitely prolonged.

USEFUL INFORMATION.

Comparative Wear of Coin.

In the annual report of the deputy master of the English mint for 1884, just issued, there appears an interesting note by Mr. Hill, superintendent of the operative department, and Prof. Chandler Roberts, chemist of the mint, as to the comparative rate of wear of coins of different metals and alloys. Experiments made by the same gentlemen on a former occasion pointed to the conclusion that differences in the mechanical treatments of coin affect the durability of such coins. They have now made experiments as to the effects on the wear of coins of extreme hardness. They coined 100 pieces in a variety of steel which was capable of receiving sharp impressions when soft, yet would harden energetically when rapidly cooled in water. Fifty of the coins were hardened after striking, and fifty left just as they came from the dies. The former lost an average of .0029 after 26 hours, and the latter .0032 per cent when separate from each other. When the two lots were mixed together the soft steel coins lost an average of .0077 after 52 hours and the hard one .0042. According to the experimenters, these results show that the wear of steel against steel is considerable. In comparing equal times they say: "The amount of metal lost, even in the case of hardened steel, approximates closely to the loss sustained by coins struck in gold (standard 916.6) and silver (standard 925). A further objection to the use of steel coins is the destructive influence they would exert if allowed to mix freely with coins of other metals, and it is set forth that when fifty hard-steel coins and fifty silver coins were revolved together in a drum for seven hours the former lost nothing, while the silver coins lost an average of .046 of their weight, some of these coins losing as much as .0050. Experiments with coins of 25 per cent nickel and 75 per cent copper, the alloy usually employed for the coinage of nickel, showed that the loss was very small as compared with coins of pure nickel, being, after thirteen hours, .0004 with the former and .0011 with the latter, thus demonstrating the advantage of the copper alloy.

THE MOSS INDUSTRY IN FLORIDA.—The moss industry of Florida is said to surpass in value and importance the cotton industry of that State. We clip the following from a recent Florida paper: W. H. Barlow and C. C. Davis, of Longwood, are to establish a factory near Gee creek, at the west end of Lake Jesup, for the manufacture of moss mattresses. They are having a steamer 50 feet in length constructed to convey the moss from any part of the lake to their factory, and they will give 75 cents for each hundred pounds of cured moss delivered at any point on the lake. The moss is cured as follows: A pit is dug four feet wide and two feet deep, in which the moss is placed and covered with earth, and allowed to remain one month, at the end of which time it will be perfectly cured. They claim that their mattresses will wear well and not flatten out and mat down as do those manufactured of imperfectly cured moss. Converting the moss to domestic uses will prove mutually beneficial, as it will enable many people to earn considerable in gathering and preparing the moss for use, and it will add another to our limited industries. If they should get more moss than they can use, it will be shipped to furniture manufacturers to be used in upholstery.

UTILIZING SAWDUST.—Refuse sawdust is now made to yield a handsome profit. When dry it is carbonized in iron retorts, and in the process is given off some 80 per cent of volatile products, the remaining 20 per cent being granulated charcoal, which can be used in making gunpowder, filters, lining refrigerators and as a disinfectant. With a very little tar it can be pressed into bricks and useful as a fuel. Twenty-two of the 80 per cent volatile product is in the shape of fixed gases, useful for lighting, heating, etc.; 47 per cent is pyroigneous acid or crude acetic acid, and after being purified and concentrated, is valuable in white lead, color, print, and vinegar manufactures. There remain 10 per cent of tar and 1 of wood alcohol. The former has the same properties as coal tar, with its almost endless variety of applications in art and industry, while the wood, or methylic alcohol is employed as a solvent for gums, in varnish making, and in the manufacture of aniline colors, etc.

COATING ZINC WITH NICKEL.—In coating zinc with nickel by means of a galvanic current the zinc must be first cleaned by diluted hydrochloric acid and thoroughly washed. It is then hung in the nickel bath for a short time, taken out, rinsed and thoroughly scraped, so as to remove all the metal that does not adhere firmly. This operation is repeated till the zinc is covered with a thin film of nickel, which can afterward be made as thick as required. The suitable current strength is easily found, and when the zinc is once thoroughly covered the current may be increased without risk of the nickel peeling off.

PAPER PULLEYS.—The strength and inflexibility of paper, when pasted or glued together in blocks, and subjected to heavy pressure, had been fully tested in the paper car wheel, and why inventors were so tardy in discovering its utility in the construction of belt pulleys is the

old question asked on the discovery of every valuable improvement in machinery. Three patents have been granted for this purpose. One is for a composite pulley, formed of a cast-iron hub, a web or body made of paper, pasted and pressed into a solid block, of the thickness to give it the required strength, and this web, surrounded by a wrought or cast rim, secured to the web by means of knees or flanges riveted through the rim and the paper. The inventor claims that by actual test it has been found that the rim having a uniform bearing upon the paper body, is more steady, even, and perfect than any one pulley heretofore made.

TO DETERMINE THE SAFETY OF COAL OIL.—To ascertain whether a sample of petroleum is sufficiently volatile to be dangerous, Herr Montag points out a very simple and conclusive method. He fills a glass three parts full with the petroleum to be tested, and fills up the glass with boiling water, at the same time holding a flame over it. If the vapor disengaged becomes ignited the petroleum should not be considered a safe liquid to leave exposed to the atmosphere.

TO DETECT LEAD IN CULINARY VESSELS.—M. Fordoz gives in *Cosmos* a very simple and useful method for detecting lead in the tinning of culinary utensils. The vessel being carefully cleaned to remove grease, a drop of nitric acid is applied to any part, and a gentle heat is employed to dry the spot. A drop of solution of iodide of potassium is applied to the spot, and if lead be present a yellow iodide of lead is formed.

THE TELEGRAPH IN CHINA.—China, which only six years ago had but six miles of telegraph lines, has now completed a system by which Canton, the capital of Southern China, is brought into direct communication with the metropolis of the north. News from the principal cities can now reach London within four hours.

When putting away the silver tea or coffee pot, which is not used every day, lay a little stick across the top under the cover. This will allow fresh air to get in and prevent the mustiness of the contents, familiar to boarding house and hotel sufferers.

GOOD HEALTH.

Remember the Skin.

There's a skin without, and a skin within, A covering skin and a lining skin; But the skin within is the skin without, Doubled inward and carried completely throughout.

The palate, the nostrils, the windpipe and throat, Are all of them lined with this inner coat, Which through every part is made to extend, Lung, liver and bowels from end to end.

The outside skin is a marvelous plan For exuding the dregs of the flesh of man, While the inner extracts from the food and the air What is needed the waste of the flesh to repair.

Too much brandy, whisky or gin Is apt to disorder the skin within, While if dirty and dry, the skin without Refuses to let the sweat come out.

Good people all, have a care of your skin, Both that without and that within, To the first give plenty of water and soap, To the last, little else but water, we hope.

But always be very particular where You get your water, your food and your air, For if these be tainted or rendered impure, It will have its effect on the blood, be sure.

The food which will ever for you be the best, Is that you like most, and can soonest digest, All unripe fruit and decaying flesh Beware of, and fish that is not very fresh.

Your water, transparent and pure as you think it, Had better be filtered and boiled ere you drink it, Unless you know surely that nothing unsound Can have got to it over or under the ground.

But of all things the most I would have you beware Of breathing the poison of once breathed air; When in bed, whether out or at home you may be, Always open the windows and let it go free.

With clothing and exercise keep yourselves warm, And change your clothes quickly if caught in a storm, For a cold caught by chilling the outside skin Flies at once to the delicate lining within.

All you who thus kindly take care of your skin, And attend to its wants without and within, Need never of cholera feel any fears, And your skin may last you a hundred years.

N. Y. Herald.

A REMEDY FOR FELONS.—The *Phrenological Journal*, which is not apt to give currency to humbugs, publishes the following: "Cures" for whitlow or felon, are as common as "cures" for cancer, and we are always inclined to smile at the easy credulity of the periodicals that give them space in their columns. Lately we have met with the following, alleged to be the statement of a physician, named C. C. Gratiot, in several of our medical and other exchanges, and as it is of a character that is simple enough for anyone to try who may be suffering from this painful form of periostitis, we publish it: "Take common salt, roasted on a hot stove

until all the chlorine gas is thrown off, or it is as dry as you can make it. To a teaspoonful, and also a teaspoonful of pulverized Castile soap, add a teaspoonful of Venice turpentine; mix them well into a poultice and apply to the felon. If you have ten felons at once, make as many poultices. Renew this poultice twice a day. In four or five days your felon will, if not opened before your poultice is first put on, present a hole down to the bone, where the pent up matter was before your poultice brought it out. If the felon has been cut open or opened itself, or is about to take off the finger to the first joint, no matter, put on your poultice; it will stop right there, and in time your finger will get well, even if one of the first bones is gone. Of course it will not restore the lost bone; but it will get well soon. So far as my faith went in the treatment of a felon in that way, I never would have tried it. My patient came back to me in four days, with pain and throbbing all gone, and with no tenderness or swelling. Upon removing the poultice there was a round hole down to the bone, discharging a bloody thick pus, such as I have sometimes seen come from acute ulcers. He stated that after the first application of the poultice, about eight hours after he left my office, he suffered no more pain; in three days more, he was almost entirely well. This induced me to determine to try it on other felons that I might be called upon to treat; and from July until the middle of October a great many felons occurred among the farmers, caused by the frequent handling of pitchforks in making hay, and in stacking and threshing grain. Sulfur to say I tried it on seven cases of felon, and it never once failed me. It is simple in preparation, and the soap and salt are always at hand, which, with a very few cents' worth of Venice turpentine, will make many poultices. The cases in which I used it got well more rapidly and suffered less pain, and the finger regained its normal condition more quickly, than after incision or any mode of treatment I had ever previously adopted."

A New Remedy for the Headache.

We clip the following from the *Physicians and Surgeons' Investigator*—a good medical authority: We desire to call attention to a simple, and at the same time wonderfully efficient, treatment for headache. We lay no claim to originality, nor do we know who the originator was, but having used it for a year or more, and in many cases with remarkable results, we feel disposed to give our endorsement, and desire to make it more generally known. The remedy is nothing more or less than a solution of the bi-sulphide of carbo. A wide-mouth glass stoppered bottle is half filled with cotton or fine sponge, and upon this two or three drams of the solution are poured. When occasion for its use occurs the mouth of the bottle is applied to the temple or as near as possible to the seat of pain, so closely that none of the volatile vapor may escape, and retained there four or five minutes or longer. For a minute or so nothing is felt, then comes a sense of tingling, which in a few minutes—three or four usually—becomes rather severe, but which subsides almost immediately if the bottle be removed, and any redness of the skin that may occur will also quickly subside. It may be re-applied, if necessary, several times in the day, and it generally acts like magic, giving immediate relief.

We believe that this was the basis of a once popular nostrum. The class of headaches to which it seems especially adapted is that which may be grouped under the broad term of "neurotic." Thus neuralgic, periodic and hysterical headaches, and even many kinds of dyspeptic headaches, are almost invariably relieved by it. True, the relief of a mere symptom is quite another thing from the removal of the cause, yet no one who has had the distress, and even agony, caused by severe and frequent recurring headaches (and who has not seen it?) but will rejoice to be able to afford relief in so prompt and simple a manner; besides, it is sure to secure the hearty gratitude of the patient if he has suffered long. As to the modus operandi we have nothing more definite than a theory to offer, and that is that the vapor being absorbed through the skin produces a sedative effect upon the superficial nerves of the parts to which it is applied. We know by experiment that its influence is not due to its power as a counter-irritant. We, however, know that it does act, and if we do not clearly see in what way it acts, that is no more than can be said of several other remedies which are firmly established in professional favor and confidence.

HUXLEY ON THE WEIGHT OF MAN.—Prof. Huxley asserts that the proper weight of man is 154 pounds, made up as follows: Muscles and their appendages, 68 pounds; skeleton, 24 pounds; skin, 10½ pounds; fat, 28 pounds; brain, 3 pounds; thoracic viscera, 3½ pounds; abdominal viscera, 11 pounds; blood which would drain from the body, 7 pounds. The heart of such a man should beat 75 times a minute, and he should breathe 15 times a minute. In 24 hours he would vitiate 1,750 cubic feet of pure air to the extent of 1 per cent. A man, therefore, of the weight mentioned should have 800 cubic feet of well ventilated space. He would throw off by the skin 18 ounces of water, 300 grains of solid matter, and 400 grains of carbonic acid every 24 hours; and his total loss during that period would be six pounds of water and a little more than 2 pounds of other matter.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KEYSTONE.—Amador Sentinel, Aug. 5: We understand that the force of men at the Keystone mine of Amador has been somewhat increased of late. Messrs. Stewart and Tevis, who are interested in the John Bull mine, were up from the city last week looking at their property. John Belluomini has a fine quartz prospect in his ranch back of the Moore mine. A shaft is down some distance and it has been determined to fully discover the extent and character of the lead. Operations in the Valparaiso tunnel are still being pushed. Crosscutting will be undertaken next week.

Del Norte.

NEW MINES.—Del Norte Record, Aug. 6: The excitement in regard to the newly-discovered quartz ledge near the headwaters of Coon creek still continues, and prospecting is going on all about this location. The discoverers are anxiously waiting returns from the assay of quartz sent below. Parties who have had some experience in quartz mining have burned some of the rock brought from this ledge and say that it is very rich in silver, with some gold. The ledge is reported to be 20 or 30 feet wide, and if it is as rich as indications seem to predict, it is a bonanza, not only for the discoverers, but for many others. The foothills in the vicinity of this find have never been thoroughly prospected, and we are in hopes, in fact very confident, that the strike will prove a rich one.

Inyo.

BROWN MONSTER.—Inyo Independent, August 8: The mine is six miles south of Independence station, on the Carson & Colorado railroad. A tramway is laid from the mine to the railroad, and beyond to the mill on the banks of Owens river. The mill has 30 stamps, and when in working order will crush about 45 tons of gold ore daily. There is plenty of water power for 100 stamps if needed; the water is carried from Owens river in a ditch six miles long. The water right is the oldest located on Owens river. The mine is a limestone formation in the Inyo mountains; both mine and mill site are patented; the latter covers 160 acres of good land. The mine is opened by a large incline shaft, following the dip of the vein its entire depth—about 400 feet. Five levels have been run north and south of the shaft, the longest 300 feet and the shortest 50 feet. On the surface the vein can be easily seen cropping out over a distance of over 2,000 feet. The vein in the levels has a width varying from 3 to 8 feet; the angular dip is about 30°. The ore is enclosed by well defined walls, from which it parts easily; very little of it is waste. The ground is the strongest this reporter has ever seen; very little timber is required in the mine and the roof is everywhere sound in chambers standing from 8 to 10 years. Not a trace of water is seen in the mine. About 12 inches of the vein next the hanging wall is silver-lead ore. The only work now doing in the mine is taking out this silver ore. Four men are at work; the ore they take out is shipped to San Francisco. The gold ore mined in taking out the silver is stored in the mine; about 3,000 tons of this is now broken out ready for milling. The silver ore now being shipped contains 50 per cent lead and about 75 ounces silver per ton. The mouth of the shaft is about 1,800 feet above the level of the valley. On the north end of the claim is a canyon at the mouth of which a tunnel could be started near the level of the valley, and by running 1,000 feet would strike the ledge at a depth of at least 1,500 feet below the level of the incline shaft.

BEVERIDGE.—There is now a large quantity of ore from the Keynot mine at the mill; it is intended to start the mill to-day, and the prospect is good for a long run. The Arambula extension of the Straus and Cohen ledge is now getting so rich in silver that a different process of working the ore has become necessary from what served when it was worked for gold alone. The two claims on this ledge show an immense amount of ore. About 60 miners are at work at Beveridge.

INDIAN MINERS.—Miners who were at work some time ago at Old Coso hired Indians and kept them employed until they had learned how to run arrastras. Now the Indians work on their own account. Last week Mr. Eddy, of Darwin, paid one of those Indians \$21 for a dab of gold taken from 150 pounds of rock. Surely there is a chance for white miners where Indians can pick up rock worth \$168 a ton.

MINNETTA MINE.—Last Saturday night a fire at White Hill was the prearranged signal that something good had been found. Next day Mr. Eldred went up from Independence to the Hill; on his return the next day he reported that a good body of fine ore had been struck in the Minnetta mine. The extent of the ore body has not yet been ascertained.

UNION MINE.—The lower workings of the Union mine, at Cerro Gordo, all beneath the main tunnel, have been leased by Locket, Casey and Basto. Already quite a force of men are at work and the number will increase as the mine is opened up. There is a large amount of ore already out and ready for shipment.

Mono.

STANDARD CON.—Bodie Free Press, Aug. 10: The 300-level south drift has been cleaned and re-timbered for 30 feet from station. The 400-level north drift has been advanced 14 feet. South drift same level advanced nine feet; upraise 18 feet. The 450-level drift advanced 15 feet. The 500-level north drift advanced 11 feet; upraise 8 feet. The ore bodies average fully as well as per last report of August 1st. Owing to accumulation of ore at the mill the tramway was run but five days, delivering 406 tons. Mill is running steadily and well. Total number of men employed 67.

BODIE CON.—The east crosscut 700. Lent Shaft level is now in 167 feet. The south drift, same level, is in 202 feet. The east drift, 550 level is in 15 feet. North drift second incline level is in 27 feet. Upraise from 400 level is up 12 feet. East drift from north drift between 300 and 400 levels is in 20 feet. Upraise 300 level was advanced 10 feet. The joint east crosscut 400—Mono—level was advanced 13 feet. Twenty-five men employed.

MONO.—The joint east crosscut 400—Mono—level was extended during the past week 13 feet. Winze No. 2,550—Lent Shaft—level, 400 feet from Bodie line is down 60 feet. South drift, same level is in 15 feet. Six miners and one engineer employed.

Mariposa.

MINES NEAR COULTERVILLE.—Mariposa Gazette: On Monday last, Charles Haderer, an old-time resident on the north side of the river, above Coulterville, called upon us, and from him we received many bits of information concerning that section. Mr. Haderer answered our questions about the mines over there the best he could, by first stating that the output of quartz mining by machinery in that section is not very flattering at this time. That at the Bandereta mine, Charlie Mast, the superintendent, is still pushing the work forward to the best advantage. At present the water in the North Fork, from which a supply of water has been obtained is so extremely low that the mill is idle and crushing of rock suspended for the present. They only have about a dozen men employed in and about the mine at this time. The Hasloe mine started up about six weeks ago. It took nearly a month to get the water out. It was originally a ten stamp mill, but they have taken the stamps out and the quartz is crushed by some other kind of machinery. They have 100 cords of wood at the mill, and are taking out ore. The vein lies very flat, which vastly increases the labor of getting out the ore. It is hoped a favorable report will be heard from this mine before long. A quartz vein was found on the ranch of A. D. Gordon by Mr. Clark, son-in-law of Aug. Olney. The five stamp mill of Pete Longhurst has been procured and put upon it. It is thought to be an excellent mine and has been bonded to some San Francisco parties. The Quail mine extension, belonging to Bill Warner, is no doubt a good vein. It is situated on Indian gulch, and is worked by Warner whenever he has time and money. Informant thinks it about the best vein and mine in that section. The Red Cloud mine is owned by a San Jose company, Gaines & Carter. They have a ten stamp mill put up by Jim Piper, and is in good condition for crushing rock. This mining property in the past has been subject to too many fangled machines. It has undergone the Dodge process and Huntington's new invention, but is now back to first principles, the regular stamps. The last sinking on the vein is 100 feet below the 400 foot level, and is on excellent ore, with a three foot vein. The mill will start up soon. The Compromise mine is still idle, but is guarded by Superintendent Lawrence. It is thought that this mine is as good as it ever was. The cause of its failure was, the Chinamen employed stole all the specimen quartz and coarse gold. The Reed brothers have found a good vein on the North Fork, below the mouth of Goodwyn gulch. It is a rotten decomposed rock, and shows one foot in thickness at nine feet depth and extremely rich. They think they have a bonanza ahead. We hope they have. The Grub claim, belonging to Tom Byrd, as usual furnished him, through the process of a hand mortar, all the gold he wants to purchase a bill of grub.

Nevada.

WASHINGTON ITEMS.—Nevada Transcript, Aug. 6: The Spanish is one of the most promising mines in Washington township. Although comparatively a new development, it is already on a paying basis. The Huntington crusher recently erected is running smoothly and with the best of results. Twenty-five men are employed. The San Francisco gentlemen who recently bonded the Baker mine on Diamond creek, are now making a test crushing of 100 tons of ore at the mill on the Ocean Star claim with which it is connected by a tramway half a mile in length. If the crushing gives favorable results, extensive machinery will be put on the Baker ledge and its systematic development begun. Frank Hathaway, of this city, is prospecting an extension of the Spanish mine and getting some encouraging indications.

Plumas.

INDIAN VALLEY MINE.—Greenville Bulletin, Aug. 8: For some time past 45 men have been employed making necessary repairs and prosecuting new work. Sinking on the shaft continues and the rock is good. A tunnel is being run west under the old Union works at a depth of 212 feet below the lowest workings. One is being run east, also, at a depth of 418 feet below the lowest workings in the eastern end of the mine. The excavation for the new hoisting works will be completed this week, and the machinery at the Greenville Iron Works is nearing completion—is to be ready by the 20th inst. The "pipe tunnel," tapping the shaft, is completed, its length being 500 feet. A great deal of work has already been done. Good progress is reported.

RIVER ITEMS.—Plumas National, Aug. 8: Cameron is getting good prospects out of his quartz at the head of Rich Gulch. C. R. Hallsted is taking out some nice chips on the Yorks' Ranch claim. Fred. Lewis has some very rich quartz, but is doing nothing, as his claim is in litigation. Cap. Corser's claim on the gulch is paying good dividends regularly. Mitchell Phelps & Co. will have the frame of their quartz mill on Deadwood finished next week. Charley and Alfred Hyde are fitting up their claim at Twelve Mile Bar in good shape for next spring's run.

Placer.

A NEW QUARTZ LEDGE.—Herald, Aug. 8: A valuable quartz lode was struck last week at Star-town, two miles above Last Chance, by P. W. McArthur, Tillotson & Dixon and Messrs. Byrne and Rumbold. These gentlemen were running a tunnel toward a gravel channel, and in doing so cut a ledge thirty inches wide some 300 feet below the surface of bedrock. The ore shows finely in free gold, iron pyrites and galena sulphurets; and as there will be no hoisting or pumping to do in extracting the ore, it is the opinion of competent miners who have examined it that it is the most important quartz strike that has yet been made in the upper part of Placer county.

Shasta.

NOTES.—Shasta Co. Democrat, Aug. 5: The amount of mining machinery shipped here and unloaded at the depot speaks volumes for the mining industry of the county. Dan Haskell, the messenger, has struck a rich gold quartz prospect about six miles north of Redding near the Sacramento. Messrs. Dale and Hiatt of Buckeye are doing good work on their quartz mine near Churntown. They have a shaft down 30 feet. At this depth the vein

is four feet wide and the rock prospects exceedingly well in free gold. The Portuguese flat hydraulic mine has closed down for the season. We are told the cleanup for the past season's run was much better than was anticipated by the company. The claim is being put in order for a big run next season. The Breslausers think they have discovered a tellurium mine on their land between Redding and Salt creek. They have given parties a big interest in the find to prospect it. It is said the croppings greatly resemble the ore in the Schearer mine. The quartz mill and other machinery, which Hon. Reuben Clark, of Colusa, will erect on the Harrison mine at Quartz Hill, is expected here this week. Harrison has got the mill-site ready to receive the machinery. The pump and pipe arrived Monday. Ed. Reid tells us that his company will not have their quartz mill running as soon as expected. A piece of the machinery was accidentally broken which will have to be duplicated. This will cause a loss of time, but they expect, however, to be crushing rock inside of 15 days. Dan O'Neal is crushing ore from the second extension of the Florida. This mine was located last spring by a company of prospectors, and since then they have taken out about 200 tons of high grade ore, all of which Dan has contracted to mill. The boys have a good stake in hand and of course are happy. The new Winthrop Company at Copper City are highly elated over their latest prospect. Since commencing to develop the mine they have opened up a body of ore that in richness is way beyond anything they expected to find. They have found silver ore, so we are informed, that is malleable and can be panned with a knife. The Schearer & Rattler tellurium mine continues to hold out in rich ore and is attracting as much attention from the curious as ever. Last week a working shaft was commenced 50 feet east of the old one. They expect to strike the drift tunnel with the new shaft in 60 feet. People from all over the country, many living 500 miles distant, have come to see this wonderful mine. We are informed that Jas. Sallee told parties in Redding last Saturday that the Lost Confidence mine is positively sold this time and that the transfer of property will be made this week; that he has been to Copper City to secure the old saw-mill at that place, and partly negotiated with Lee Fader to haul the mill to Iron mountain, where it will be re-erected to saw timbers for the mine.

CENTERVILLE.—Shasta Courier, Aug. 8: Ward and Cornell are busy on their mines at Centerville and no doubt have the "deadwood" on fortunes. Some of the rock brought in from one of their ledges by Johnny Deoblin is said to contain tellurium. It is also said that some of the rock taken from the Potosi mine there, and left around the old mill site, has been tested, and tellurium found in that. The Potosi claim paid well as long as worked, and that, too, with machinery not fit to crush corn cobs. We understand that the Lost Confidence mine at Iron mountain has been sold to a solid company of San Francisco who will work it on a large scale and begin operations at once. It is expected a 10-stamp mill will soon be running there. Reports from the Copper City mines are very favorable and the prospects are bright for some people to get rich there.

Sierra.

A PROMISING LOCATION.—Tribune, Aug. 7: The Cleveland quartz claim, located on the east side of Nigger canyon, and about one mile north of the Florence mine, has every indication of being one of the most important finds made in this section for some time. A tunnel has already been run in on the ledge a distance of 125 feet and the prospects obtained there are hard to beat. A shaft is also being sunk to connect with the tunnel, which is run 45 feet below surface. The shaft is down 20 feet and the vein is improving every day. Four men are employed there at present, and the owners, Antone Demartine and Joe Topia, of Sierra City, propose to commence the erection of a five-stamp mill in a few weeks. They consider that there is a sufficient quantity of ore already in sight to justify them in going ahead with the mill. The vein has an average width of about two feet and in a great deal of the rock gold is plainly visible to the naked eye. The ledge can be traced by the croppings for several hundred feet down the mountain side. There is an abundance of water near at hand, which can be utilized for milling purposes.

San Bernardino.

PROVIDENCE MILL BURNED.—Calico Print, Aug. 8: The hitherto prosperous camp of Providence 100 miles east of Daggett and 22 miles from the Atlantic & Pacific railroad, has met with a misfortune that will retard its progress for several months at least. Last week the beautiful and thoroughly equipped 10-stamp mill, that it is said cost \$100,000 to build the same, was burned to the ground on the 31st inst., not a vestige of the structure and its contents escaping destruction. In consequence the miners employed in the Bonanza King mine were discharged excepting a few. The business of the town will suffer considerably until operations are resumed in the mine. It is thought that the work of erecting a new mill will begin shortly and that its capacity will be greater than the one destroyed. Mr. Wilson Waddingham arrived at Providence last Friday and no doubt he will immediately commence to make preparation for the erection of a larger and finer mill than the other, which can be accomplished for considerable less than the former, on account of cheap transportation. The last run of the unfortunate mill resulted in turning out 26 bars of bullion, so we were informed, which shows that the Bonanza King is still a healthy bullion producer. We expect to see that promising camp make rapid strides within the next six months, and the present active operations on the Kerr mine will be an important factor in the progress of the camp.

BUENA VISTA.—Calico Print: This mine lies north and west of Calico and distance 40 miles or thereabouts by wagon road. The owners are the Bugbee Bros., Levi Pennington of Calico, and Col. Barstow. The ores carry principally copper. A shaft was sunk on the vein or rather sunk in proximity to it, to a depth of 175 feet. At a depth of 40 feet a cross-cut was run, disclosing a vein of red cuperite of copper, of a high grade of some three feet in width. At the 100-foot level a cross-cut was again run. The vein at this depth is five feet wide in a body of solid black oxides of copper, yielding at the average of 40 per cent. At the bottom of the shaft 120 feet the vein was again cross-cut, and now found to be no less than nine feet in width in solid copper ore, commonly nominated as black oxides here, carrying a high percentage of bismuth.

Great credit is due the owners of the above named mine for the energy displayed and used in thus opening up and developing a mine so comparatively remote and isolated as is Granite district.

San Diego.

PINACATE MINE.—San Diego Sun, August 6: A force of thirteen men are at work on the Mennifee mine, divided into day and night shifts. They have run a drift 110 feet. The drift is about 28 inches wide and the ore will average between \$12 to \$15 per ton. Seven or eight tons have been taken out, and the men are engaged in rocking it as fast as received for shipment to San Francisco. It will be shipped via San Diego. B. F. Paterson is superintendent. A five-stamp mill is being erected, and very little more ore will be shipped away. On the Pinacate mine a force of men are at work developing. A new discovery of tin has been made between Pinacate and the old Temescal tin mines. The tin crops out in magnetic iron, and was supposed to be gold. It assays from 4½ to 6 per cent on the tin surface. A shaft has been sunk six feet, and no walls yet discovered. The mine is owned by Mike Kinney, lately of Butte, Montana. A rich discovery of gold quartz has just been made on the high mountain west of Elsinora.

Tuolumne.

BUCHANAN.—Tuolumne Independent: Mining operations are being rushed at the Buchanan. On Tuesday, 14,000 lbs. freight went up from Summerville, from San Francisco, for the mine—consisting of a new boiler, machinery for the hoisting works, etc. It was brought by Hall & Campbell's teams, and the freight bill to Summerville footed up \$204. The road extends no further, and the machinery will have to be let down the side of a hill by means of ropes and pulleys, ferried across the Tuolumne river, and moved up steep hills by means of ropes and pulleys again. Altogether a distance of six miles will have to be traversed after the road ends, and the moving for that distance will cost \$700 or \$800 more, making a total of about \$1,000 from the city to the mine. The new saw-mill is now running, and turning out all the lumber they need, at a cost of about \$10 per 1,000 feet. Heretofore lumber laid down at the mine cost about \$25, and hard to get in at that figure. It is to be hoped that this mine will prove all that is expected of it, and that other good mines, now idle, will soon be started up.

STARTED UP.—The Gilkey Slide mine started up this week. The water will be out in a few days, and they will then be ready to commence sinking the shaft. Mr. G. has erected new hoisting works, and has a larger boiler and engine, so that he will be better prepared to work the mine. He is sinking for gravel, and has considerable water to contend with. It is Mr. G.'s opinion that this is an old river channel. If this be the case, there is no doubt but what he will be well paid for his work if he can get deep enough. They will work 3 men 8 hours shift in the mine (single hand). The engine is under the management of H. Pierce and T. Soulsby, of Soulsbyville.

GRAVEL.—Alt. Messenger, Aug. 8: A few days since the Red Oak Co. raised a shaft at the inner end of their tunnel, and at a height of about eighteen feet encountered a body of quartz gravel. None of the gravel had been prospected when our informant left the mine. The wash is heavy, and that they have opened a genuine Pliocene gravel channel, there cannot be a shadow of a doubt. Much credit is due the owners for their perseverance, and they deserve the reward which they will, in all human probability, soon reap. Only one quartz mill is running at Poker Flat, due to the scarcity of water. The new pumps were got to work in the Extension shaft last Sunday, and have furnished the necessary water to enable washers to keep up with the drifters since. The clean-up of the Bald Mountain Extension Co., Forest City, for last week's work was 103 ounces. We learn that an arrangement has been entered into by which the Phoenix quartz mine at Sierra City, owned by the Beard brothers, is to be more thoroughly developed. It is reported that a tunnel is to be put in until it reaches the shaft, that is to say, under the shaft but deeper, when if the development is satisfactory, a sale of the mine will be made. What price is to be paid we do not know. That the mine is a good one there is not the shadow of a reasonable doubt. Messrs. Deidesheimer and Busch are the parties who have taken hold of the work of development, and they already have a force of men at work.

Trinity.

DEADWOOD.—Cor. Trinity Journal, Aug. 8: Our mines never looked more brilliant and our people more happy than at the present period. Our business houses are flourishing and we begin to appreciate the full value of a rich and extensive mining camp. The latest strike is that of Jud and Walter Van Matre upon the Diener location. The vein is from 5 to 10 inches in width, and prospects, at the lowest estimate, \$100 per ton. Jud and Walter are faithful and enterprising young men and may their recent strike prove a bonanza. Wm. Blagrove on the extension of the Black Bear is doing lively work, and the ledge never looked more promising. When stoping commences we may expect to see some nice specimens of rich ore. Westlake and Cosgrove have struck it in their mine richer than ever. Before there was considerable gold hanging to the quartz, but now there is considerable quartz hanging to the gold. McDaniels, on the Enterprise location has struck it very rich. The vein in places is 15 inches wide, and prospects immense. I prophesied some time ago that you would "hear from him again," and now the prophecy is fulfilled. Gibson and Leavitt are running a lower tunnel which will tap their rich vein about sixty feet and when the task is accomplished we will "feast our greedy eyes with gold." Thomas Simons, superintendent of the Shattuck mines is doing very active work and ore is being extracted continually. J. F. Doliff's mine looks favorable from all accounts that can be learned, and Boothby and Hendries on Dennison's location are satisfied with the outlook.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia Enterprise, Aug. 8: The deep winze was down about 80 feet below the 3,000 level at three o'clock yesterday afternoon, well timbered throughout, and the bottom still continued in ore. The north lateral drift from crosscut No. 2 is now extended over 125 feet from the crosscut and making good progress, skirting

along the eastern side of the ore vein, with its face in clay, quartz and porphyry. Like the wine, it is in a comparatively dry formation, water giving no trouble whatever. As before remarked, when this drift shall have reached a distance of 150 feet from crosscut No. 2 its face will be directly under the north development of the ore body on the 2,900 level, and two crosscuts west will be started from it. The new hydraulic pump addition will be in working position in about two or three weeks, ready for any possible influx of water that may be tapped in any direction, when exploration and development work can and will be done fearlessly and practically.

CIOLLAR.—The only work being done in connection with this mine is at the Combination shaft. The whole of the ponderous and massive castings constituting the new half or duplicate section of the big hydraulic pump, six carloads in all, have arrived from San Francisco, and to-morrow the management will commence putting the same in working position. This will take about two weeks. The whole was put together and thoroughly tested in San Francisco, therefore when set up in practical working condition it is expected to start into successful operation at once. The shaft is now down 116 feet below the 3,000 level, and further sinking is abandoned at present in order to allow of placing the hydraulic pump. The rock is hard and no increase of water met with, but further sinking cannot be done until the pump is completed, as all the working force and opportunity at the shaft will be employed in so doing. Work in this shaft, as well as in the Hale and Norcross and other mines, is suspended to-day on account of the funeral of General Grant.

THE GOLD HILL GROUP.—Little is being done in the Yellow Jacket beyond repairs to the main incline. The Brunswick mill, on Carson river, which has been reducing the ore, is now too much reduced in its water power to be of much use, and it is being overhauled with a view to adding steam power to its reducing facilities. If this is found to be a paying proposition further ore and bullion production from the Yellow Jacket may be looked for. Crown Point, Belcher and Kentuck continue their diminished production of low grade ore from the old workings. A few men have been put on again in Crown Point to open out new prospects and explorations and put things in better shape for ore extraction.

CON. CALIFORNIA AND VIRGINIA.—The average extraction from the Jones lease section is reduced to about 50 tons a day, but when the repairs to the old Consolidated Virginia shaft are completed better facilities will be given and the ore yield much increased. The ore assays \$18 per ton from car samples. Over 100 tons per day are being extracted from the 1,750 level, on company account. It is of good quality, assaying over \$20 per ton from battery samples. The upraise above this level has been connected with the old drifts above, giving better ventilation.

MONTE CRISTO.—The new shaft is now down 55 feet, and has been substantially timbered from top to bottom. The galleys or hoisting frame is being put up, and a steam engine will soon be called into requisition in further sinking.

ALTA.—The explorations are being steadily continued in the upraise from the 900 level, searching for the ore deposit indicated by the stringers heretofore met with. A small force of men are employed in this work.

SIERRA NEVADA.—The north lateral drift on the 520 level is now 983 feet in length, having gained 46 feet during the past week. The face is in fine looking vein matter, carrying little or no ore.

BULLION.—The drift west on the 160 level is in 100 feet from the Fairview shaft, and is getting into close proximity to where a good ore vein is expected to be found.

GOULD AND CURRY. Crosscut No. 1, west on the 1,000 level next to the Savage line, is now out a little over 100 feet, and running in very promising vein material.

BEST AND BELCHER.—On the 1,000 level the crosscut west near the north end of the mine is now out over 400 feet and making good progress in favorable looking ground.

OVERMAN.—A small force of men are employed in explorations and prospectings on and above the 226 level. No ore is being shipped to mill.

Cortez District.

BULLION.—*Silver State*, Aug. 8: S. Wenban shipped by Wells, Fargo & Co.'s express to San Francisco, yesterday, six bars of bullion, valued at \$6,000, from his mine at Cortez.

Eureka District.

ORE SHIPMENTS.—*Eureka Sentinel*, Aug. 8: The ore shipments from the small mines of the district to the furnaces in town go by fits and jerks, so to speak. During the past week they have been unusually small, despite the fact that new and valuable developments have recently been made and the number of producing properties is fully as great, if not greater than any prior time this year. The Virginia in New York Canyon made a shipment the other day to the Eureka Con. furnace, and the Mountain Boy, a property in the range of mountains immediately west of the Ruby Hill tunnel, sent in quite a lot of good ore to the Richmond works. To the latter works the following shipments were also made: Silver Connor, 39 tons; California, 5; Rescue, 9 and Hartnett 5. The Jackson mine on Ruby Hill shipped to the Eureka Con. furnace 78 tons. The Eureka Con. mine continues to look and produce well. The Williams ore body on the seventh level is proving even more extensive than was anticipated, and the ore is of a good quality. The Richmond mine is also said to be producing well.

Ophir District.

RUMORS.—*Belmont Courier*, Aug. 6: Rumors come floating in that the Twin River Mining Company will soon recommence operations in their mines at Ophir. They have a good property and it ought never to have been shut down.

Park Canyon District.

THE GRANT.—*Belmont Courier*, Aug. 6: Park Canyon will soon be the scene of active operations, and when the music of the stamps disturbs the stillness that has reigned there so long, the Giant mine will have been added to the list of bullion producers. The ore is of a rebellious character, but it is claimed by those who know that it can be successfully and profitably leached. From reliable authority we hear

that there are 30,000 tons of ore in sight and on the dump at the Giant mine, Park Canyon. This ore is of a character that does not require sorting and can be run through the mill as it is taken out. Twenty thousand pounds of the old Jefferson mill started on Thursday for Park Canyon on the Hon. A. H. Greenhalgh's prairie schooners. More shipments will follow regularly till nothing but the mill site is left in Jefferson.

Willow Creek District.

THE WILD DEER MINE.—*Silver State*, Aug. 8: News has been received here of an important strike in the Wild Deer mine at Willow Creek. This mine is owned by H. H. McColley and R. McLeran, who also own the Silver Wave mill. The extent of the new ore body in the Red Deer has not yet been ascertained, but it is said to have created quite an excitement in the camp.

ARIZONA.

BULL WHACKER.—*Prescott Courier*, August 8: Messrs. Curtin and Jackson have erected several buildings at the Bull Whacker mine, and are preparing to increase the working force as soon as the timbering is completed and the mine opened sufficiently to admit of more men working. They have four skilled miners at present, and are confident of a big thing. The first announcement of the completion of the Sterling mill was given out yesterday afternoon, by the shrill whistle of this plant. This morning the machinery was started on its steady run on ore from the mine that is represented to be of such immense wealth, which we hope will be duly verified by the number of gold bars it is expected to turn out.

IDAHO.

PHILADELPHIA SMELTERS.—*Ketchum Keystone*, Aug. 8: The Philadelphia smelters, after exhausting all efforts to procure a supply of fluxing iron, yesterday run out of that commodity, and in consequence were obliged to cease operations. It is particularly unfortunate, as there is plenty of ore on hand, and receipts daily are sufficient to continue work right along. The O. S. L. Ry. have contracted to supply 20 tons of iron ore per day, but through some at present unaccountable inadvertence or failure, they failed to fulfill their contract. The two large 50-ton stacks have now made a continuous run of eight weeks, which in itself is remarkable. Supt. Haddess will no doubt take advantage of this suspension and clean up with a view to vigorous resumption, which we learn will take place in a few days, when we may look for a continuous fall run. The company are buying all ore right along, so pile it in and encourage them and boom our flourishing camp. You get the best market rates for all ores, and get your money on the nail head.

SENATE.—The Senate company are making active preparations to blow in their smelter at Galena, which will take place in a few days. A limited amount of ore is intended more as a test with a view to extend operations in future. The run will probably last about twenty days, and will thoroughly develop the capacity of the smelter for treating the ores of the Galena region, and the cost of turning them into bullion there.

FROM SMOKY.—*Wood River Times*, Aug. 8: Pierce Dorgan came in last evening from Smoky. He says that four of J. O. Swift's teams will be in here Tuesday evening with 20 tons of King of the West ore. When they return they will bring in Galore ore, then Carrie Leonard ore, then McCarter's, Jos. Reedy's and George Merrill's, and so on. The shippers are compelled to take turns because of the lack of teams. The rate for hauling is \$10 per ton. At this rate, if snow does not fly too soon, between 400 and 500 tons will be brought in from Smoky before winter sets in.

THE ALMA.—The Alma claim, which is situated in Ruby Gulch, a tributary of Little Smoky, and about 2,100 feet below the Galore, on the same hill, is opening up splendidly. A drift 115 feet long, and the shaft, which is 75 feet deep, show a vein of pay ore 14 inches thick. This ore is a mixture of gray copper, zinc blende and fine-grained galena, which averages over \$225 per ton. There is a considerable quantity of this in sight, and a lot of 25 or 30 tons is being taken out, to ship to Hailey as soon as teams can be secured to move it. The Alma is owned by George Merrill, Anton Ellexson and Abe Belin.

THE SWEET GRASS MINES.—*Cor. Inter-Mountain*, Aug. 6: Prospectors should wait for more particulars before they start for the new discoveries in the Sweet Grass hills. To commence with, it is impossible to get water in any quantity. There are a few springs but no creeks, and water would have to be brought from the Rocky mountains, a distance of about 110 miles, in a flume about 600 feet high, to enable placer mines to be worked at all. This is only one of the obstacles. Moreover, there is a special order of President Cleveland in regard to prospecting on the Piegan and Gros Ventres reservation, and a party of blue coats will probably be on hand in the hills to welcome any invaders. As far as the discovery of gold and other metals is concerned that is no new thing. That has been known for the last 15 years. Not only are there enormous gold bearing bars, but there is probably the largest galena lode there in the world. The ledge can be traced by a broad black line for more than 30 miles, and varies from five to ten feet in width, and in addition has numerous spurs which jut out from it almost at right angles. These mines would have been worked long ago if the Government had permitted it. It is a shame that a few Indians, numbering not more than 300, should own a whole district—125 miles by about 200. Most of these live on the British side of the line, and eat British rations.

COAL.—*Idaho Messenger*, Aug. 8: B. W. Nelson placed on our table on Saturday a specimen of coal, which, although we are unable to tell the exact quality, is of a good grade. The specimen was taken from Wm. Hodges' location and from the face of a drift about 20 feet from the surface. We state that the coal is of a good quality, from the fact that Mr. Hodges uses it as fuel for his camp fire. It burns well and gives good heat. Mr. Nelson informs us that the whole sand reef, in which the coal is found, is full of small strata of coal, but the strata are so small and the formation so broken that he questions whether bodies in paying quantities can be found. Quality is established, quantity seems doubtful. Mr. Nelson also informs us that the contractors on the Bayhorse road have cut

through a vein of coal some 12 inches in thickness, in the said bluff, around which they are building the road bed below the mouth of Bayhorse creek. The vein cut is about 100 feet north of some old prospecting works which were driven by parties looking for coal.

MONTANA.

PURCHASE OF ORE.—*Helena Independent*, Aug. 6: Within the last few days A. M. Esler has purchased of Geo. S. Kennedy 40,000 pounds of ore from the Kennedy group of mines on Jackson creek. The ore is worth 200 ounces per ton, and consists of rich sulphurets, galena and brittle silver. A number of men are now working upon the property and the output of ore will be much greater in the course of a few weeks. Mr. Esler has also purchased 30 tons of \$400 rock from the Legal Tender Company. Under its present management it looks as if the Legal Tender was again destined to come to the front as a bonanza mine.

BUTTE.—*Miner*, Aug. 5: A *Miner* reporter yesterday visited several of the mines of the camp, and everywhere signs of continued prosperity for Butte were seen. The work of sinking and opening up our mines seems only to have just commenced. Those in charge of the larger mines of this district are only just proving that the mineral resources of Silver Bow county are simply inexhaustible, while those who are fortunate enough to own the smaller mines are confident that there are hundreds of mining properties in this camp, that will, in a short time, be as valuable as the Anaconda, Alice, Moulton, Parrot, or any of the other great mines of this section. There is enough ore in sight in the several mines of this camp to keep the mills and smelters now in operation here, in full blast for an indefinite period.

THE LEXINGTON.—It only requires a visit to the Lexington mine and mill to convince one of the prosperity that company is enjoying. The main shaft is being sunk below the 650-foot level at the rate of four feet a day. It is expected that the shaft will reach the 800 in about five weeks. When that point is reached, cross-cutting for the ledge will be commenced, and the work of opening up of the lower portion of the mine will be carried on with vigor. The mine is looking well throughout, the different stopes are producing their usual quota of ore, and the several prospects are looking very well.

MONTANA COPPER CO.—The series of mines owned by the Montana Copper Company are all looking well. The Parrot is down a depth of 330 feet, and important developments are constantly being reported at that point. The Colusa, also owned by the Montana Copper Company, has been opened up as far down as the 600, and on every level, from the 100 to the 600, the stopes are looking grand. Large quantities of fine ore are being extracted, and the ore resources are simply immense. At West Colusa, the work of sinking the shaft below the 380-foot level is going bravely on, while cross-cutting for the ledge on the 280-foot level is in order.

THE ALICE.—At the Alice everything is running along in a very smooth manner. The usual quantity of ore is being extracted from the different stopes on the 300, 400, 500 and 600-foot levels, and the general appearance of the mine is very encouraging, in fact, the mine never looked better than it does at the present time. Active preparations are being made to lower the pump below the 800-foot level, which will be done in a few days.

MAGNA CHARTA.—At the Magna Charta mine, everything denotes enterprise and prosperity. The 500-foot level continues to look well, and good ore is being extracted from the ledge at that point. The 400 and 300-foot levels are looking well, and the different stopes, drifts, etc., are producing the usual quantity of ore. The Magna Charta, from the 100 to the 500-foot level never looked as well as it does at the present time.

THE RISING STAR.—Work on the several stopes of the Rising Star was resumed last week, and large quantities of ore of a good quality are being extracted. The 300 and 400-foot levels are looking even better than usual. The pumps are working in a very smooth manner, and are handling the water very easily.

THE MOULTON.—Everything in and around the Moulton is working in its usual smooth manner. The stopes on the different levels, from the 200 to the 500, are producing the usual quantities of ore. The work of sinking a winze at the bottom of the 500-foot level is being conducted with vigor.

BLACK ROCK MINE.—The strike in the Black Rock mine, of which mention was made last week, is improving with every blow from the pick. The ledge is now seven feet wide, of which two feet will assay 100 ounces to the ton. The mine looks well all through, and Messrs. Stoner & Co. are very jubilant over the prospects they have of becoming millionaires.

THE ELM ORLEE.—Messrs. Clark & Co. have a grand property in the Elm Orlee. The mine looks grand, and the company can extract as much ore as they please. This mine is a veritable bonanza.

MINOR NOTES.—Messrs. Butcher & Boggs are taking out some very fine ore from the West Poyer. Dennis Leary is pushing matters at the Poyer mine, and his efforts are being rewarded by finding some very good ore. The Poyer looks well. The Silver Queen mine has decidedly improved during the past week, and some very important developments are confidently expected in a short time. The work of putting up the new hoisting works at the Amy Silvermine mine is progressing very favorably. When completed this will be one of the nicest buildings in the camp. The Wild Bill mine continues to look well, and the usual quantity of rich ore is being extracted. The Belle of Butte mine is producing a great deal of high grade ore.

NEW MEXICO.

IRON ORE.—*Silver City Enterprise*, Aug. 7: During the month of July ten carloads of iron ore from Santa Rita were shipped from White-water station. One carload of silver ore from Lone mountain was shipped from the same place. A large amount of leasing is going on in Chloride Flat, and on Legal Tender hill. The leasers are making money. Lone mountain miners are furnishing the reduction works with a large quantity of ore, and that camp is again

becoming one of the liveliest in the county. This time it is coming out on its merits. The Argenta mine, at Fleming, is attracting some attention from mining men. A showing of sixteen inches of high grade ore that has paid well to ship, seems to be the attraction. The claim is owned by Van Lone and others, who have unbounded faith in its outcome. The old Victoria mine, at Shakespeare, is showing up very nicely. J. N. Evenson, the owner of the property, has had two sample assays made of the ore recently, which was rated as first and second-class. The first-class went \$170 and the second \$15, which is not a bad showing. The claim will be worked by Mr. Evenson, and the ore either shipped to the most convenient sampler or allowed to remain on the dump and accumulate for the contemplated Shakespeare reduction works to treat. Several small shipments of ore have been made from the Telegraph district within the past month, mostly by J. T. Mitchell, which have given satisfactory returns. During last summer these mines paid off an indebtedness of \$12,000 from ore taken out by Mr. Mitchell, who will again endeavor to make arrangements by which the property will be worked extensively. There are mountains of low grade ore in this camp that would pay handsomely if treated near the mines. J. W. Huntly, of Tombstone, is the new superintendent of the Carlisle, vice L. E. James resigned. Mr. Huntly is said to be one of the best mill men on the coast, and will doubtless make a success at the Carlisle as soon as the new plant is completed. The principal trouble at the Carlisle has always been a lack of water. The new rolls now being put in, and which have a capacity equal to one hundred stamps, can be operated with the amount of water on hand. This will increase the milling capacity four-fifths without adding materially to the running expenses. Two hundred tons of ore are now in the bins ready for the rolls as soon as they are in shape to run. There has always been an abundance of ore in the mine, and if the new process of treating it proves successful, Carlisle will soon again be one of the best camps in New Mexico.

OREGON.

QUARTZ AND PLACER.—*Jacksonville Times*, August 7: A large number of quartz and placer claims are being located in this and Josephine counties. Thos. Brown is prospecting a quartz ledge on Jackson creek, the ore from which promises well. Parties have bonded Savage Itos' placer mines on Rogue river and are now engaged in sinking a shaft. J. Griffiths, who is mining on Hungry creek, Cal., reports good prospects both in his quartz and placer mines. Elmer Stephenson informs us that O. Collins and Chas. Williams of Big Applegate are about wingdamm the river. Several parties outside of this town have taken stock in the proposed quartz mill. It will no doubt prove of great benefit. Klippel, Denoff & Co. are about commencing work on the bed of the Applegate, their wingdam being nearly completed. Mining operations are generally suspended, though considerable prospecting is going on in both Jackson and Josephine counties. J. T. Hayes, whose friends are legion in this section, is engaged in working an excellent mine on Cow creek. We hope he will strike a bonanza. Work is being continued on Grob and Brandel's quartz ledge on Jackson creek with excellent prospects. The rock is becoming richer and more plentiful. The American Mining Guide, the best authority on this subject, for sale at the *Times* office: also blank notices for location of placer and quartz mines. John Beckner, of Applegate, was in town yesterday. He informs us that Jack Layton's supply of water is failing and he is now engaged in cleaning up one of his races. Several hundred pounds of ore from the tunnel being run across the Yank ledge is sent to San Francisco every month for assay. If it comes up to the requirements after being thoroughly tested, machinery will be put there for work on an extensive scale. It is said that the ledge is improving right along and those who have the enterprise in hand are satisfied with it.

UTAH.

PARK NOTES.—*Park Mining Record*, August 8: During July there were six location notices filed with Recorder of this district and two so far this month. The Apex will ship fifty tons of first-class ore this month which, it is believed, will run about \$225 per ton. Frank E. James has put a jigger or two in the creek running through town for the purpose of saving the silver that escapes from the Ontario tailing dams. If they prove successful he will add two or three more shortly. The interest lately taken in mining matters in this (Utah) district appears to be contagious. Mr. Chas. P. Brooks, the surveyor, started yesterday on a week's surveying trip through Blue Ledge District. This section has been under the weather for some time, but will show up well by fall. Recent important mining transactions have caused no small stir among interested parties, and prospectors are eagerly scanning every piece of rock or float which they encounter, while owners of small properties are cleaning out their old prospects and preparing for active operations. Varcoe & Bowditch are now actively engaged in jiggling the Sampson dump. They haul the ore to the springs in Woodside Canyon, where there is an abundance of water for the purpose. They expect to ship about ten tons of concentrates from here at the end of the month, and at least forty tons from their jig in Ontario Canyon. The Anchor Company's office, store-room and blacksmith shop at the mine are now completed. Ground for the hoisting works will be broke on the coming week. The hoisting engine from the Utah is going to be used, and two new steel boilers will soon arrive to furnish steam for the same. The Black Diamond and Nimrod are both patented claims, adjoining the Daly on the southwest, and are owned by Conrad and Wilfrid Abegglen, of this place, and James R. Shepard, of Zena, Polk County, Oregon. These claims were first located seven years ago and work commenced, the developments up to the present being some 200 feet in all. Several tons of ore, which the owners claim will go as high as \$500 to the ton, are now on the dump. A short time since the owners concluded that they were too far west of the main vein as indicated by the croppings, and they immediately began another shaft fifty yards east of their old workings. They are working four men at present but will increase their force as soon as indications will warrant.

Scientific Press

Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dwyer & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRIP CAR FOR CABLE RAILWAYS.—Frank P. H. Loftis, S. F. No. 323,817. Dated Aug. 4, 1885. This is a grip car or dummy for cable railroads. The improvements relate to a grip-releasing mechanism adapted to be operated independently by a lug or projection in the road-bed, and by the safety-guard previously patented by the same inventor, and also by a brake-mechanism adapted to be operated either by hand or by the safety-guard referred to.

ORE-ROASTING FURNACE.—Edmund Green, Oakland, No. 323,666. Dated Aug. 4, 1885. The invention consists in the combination of the ore-chamber, the lower and upper flues, the escape pipe at the rear of the chamber, the suction blower in the pipe, the condenser with which the blower communicates, and the air-passage extending within the shell of the furnace, above the chamber, communicating with the open air at the rear of the furnace, and with the ore-chamber at its forward end. The object of the invention is to provide a furnace for treating the sulphureted ores of gold, silver, cinnabar and tellurium ores of gold, and others containing volatile matters, which is simple and cheap in construction and effective in operation.

GUIDE TRACK FOR HEAVY FURNITURE.—Francois Delmont, S. F., No. 323,566. Dated Aug. 4, 1885. On these tracks or ways, heavy articles of furniture may be mounted, in order to permit said articles to be readily moved and save the carpets from continual wear. The invention consists in independent strips of wood or other suitable material grooved or otherwise prepared for the reception of the casters or rollers on the furniture, and having a folding or swinging end. These strips, forming the track, are laid upon the floor under the casters of the furniture, which are thus adapted to travel upon them. Their hinged or folding ends, when not in use are turned inwardly under the article of furniture, and when in use are extended so the furniture may be moved a sufficient distance.

THERMOSTAT.—Frederick Biven, S. F. Assignor of part interest to C. C. Moore and Wm. C. Seamands, of Stockton. No. 323,556. Dated Aug. 4, 1885. This invention relates to that class of heat regulators in which the expansive force of the air is utilized for the purpose of transmitting power through suitable intermediate mechanism to cause a variation in the amount of heat supplied; and the invention consists of an air-tight, independent air-chamber located within the apartment to be regulated, an inverted, vertically moving casing or vessel containing a liquid seal, a connection between said inverted vessel and the air-chamber, and a peculiar string or lever connection between the vertically moving casing or vessel and the heat-adjusting apparatus. This regulating apparatus can be used in connection with the egg chamber of an incubator.

STEAM TRAP.—Charles Watson and Alvert Gankroger, of San Francisco, Cal. No. 321,556. Dated July 7, 1885. This steam trap consists of an enclosing case, having an ingress pipe through which the water of condensation is admitted; an egress pipe through which it is discharged, the latter being controlled by a valve of novel construction; a float within the casing connected with and operating said valve, and also connected with a counterbalance lever exterior to the casing; stops for the valve and also for the counterbalance lever, and a novel means for connecting the float with the counterbalance lever without the use of a stuffing-box or packing. The valve controlling the egress pipe is of simple but effective construction, permitting a perfectly free delivery without danger of

choking. It is perfectly balanced under whatever pressure it may have to act. The capacity of the valve is such as to avoid any danger of the trap becoming over full or water-logged. The connection between the float and the counterbalance lever being a slender rod or wire passing over and through the top of the casing; no stuffing-box is needed, for while the passage is sufficiently large to allow the wire to move freely through it, no appreciable amount of steam will escape. This connection avoids the friction incidental to the use of stuffing-boxes, as they must be packed tight enough to prevent leakage, and when this is done they are apt to be so tight as to prevent the delicate action and movement of the parts which are necessary to make the trap effective.

PIPE-COUPLING.—Michael Dillenburg, S. F. No. 323,567. Dated Aug. 4, 1885. This pipe-coupling consists of a split-sleeve fitting on the pipe, and having a conical or wedge-shaped exterior surface, a head having a correspondingly shaped aperture, in which the sleeve is seated, a tubular connecting sleeve or link fitting upon the end of the pipe and seated within the inner portion of the aperture of the head, which is made with a plane-surface to receive it, a washer between the tubular connecting sleeve and the split-sleeve, and tie-bolts connecting the two heads. The object is to provide an effective coupling without having to resort to threading the pipes. The coupling is a two-part one, the parts on one side being the counterpart of those on the other.

CUT OFF VALVE FOR ENGINES.—Henry Joseph Oliver, of S. F., Cal. No. 323,065. July 28, 1885. This invention consists mainly in the employment of a hollow piston-valve, working within a valve-chamber, having passages by which steam may be admitted freely to both ends of the valve, hollow cylindrical cut-off valves working within the main valve, which is provided with suitable steam ports communicating with the ports of the cylinder, a governor of any suitable pattern, and intermediate mechanism connecting the governor with the cut-off valves, so that they may be adjusted to regulate the supply of steam to the work to be done. The cut-off valves which are short sections of cylinders, fitted and guided within the hollow main valve, are made to reciprocate and control its ports by a very simple but effective mechanism. The valves are internally threaded or provided with spiral grooves, those in one being right-handed and those in the other left-handed. A stem which passes through both valves, has radial arms upon it, the ends of which fit within the spiral grooves. The stem may be turned on its axis directly or indirectly by suitable gearing from a bar or spindle reciprocated by the governor. As the stem turns, its arms cause the valves to move in opposite directions, and in straight lines, they being guided by guide fitting in a longitudinal groove in the main valve.

DOOR OPENER.—Julius Finck, of S. F., Cal., assignor to Will & Finck, of same place. No. 323,308. July 23, 1885. This device has for its object the opening of a door from a distance. It consists of a bent lever pivoted to the back of striking plate, one end of the lever being adapted to act against and push back the latch; a vertically moving rod, the upper end of which bears under the other end of the bent lever and operates it, while its lower end extends to the

sill, and has a plunger foot guided in a tubular socket; a vertically moving rod passing upwardly through the sill, and bearing under the foot of the upper rod a pivoted bell-crank lever by which the lower rod is operated, and suitable drawing wires attached to and adapted to operate the last named lever, and extending to any convenient portion of the house. Though the device is applicable to a single door, it is particularly adapted to be used in connection with a double door, and this lies in the fact that there is a break in the power-transmitting rods, right at the surface of the sill, so that both doors may be opened, when desired; a result which could not be effected if the upper and lower rods were one continuous piece. But for a single door this could be so, as they would be located in the door frame.

CONCRETE MIXING MACHINE.—Ernest Leslie Ransome, of San Francisco, Cal. No. 322,006. Dated July 14, 1885. This is a machine for rapidly and effectively mixing materials to form concrete. The effectiveness of concrete, while depending upon the quality of the materials used in the mixture, depends also to a great extent upon the thoroughness with which the various ingredients are intermingled. This machine has not only a large capacity both in speed and amount of work it can perform, but has also this most essential feature of thoroughly and intimately mixing the materials. The machine consists of a large drum or circular casing, or shell mounted on anti-friction rollers, and adapted to have a rotary movement imparted to it. The casing has circular openings in each end or head, through one of which the materials are fed to it by means of a short chute with which a platform communicates, on which platform the workmen roll their wheelbarrows and dump their contents into the chute. An inclined discharge spout of an approximately semi-circular shape in cross section is mounted transversely through the casing, its ends projecting through the side apertures, and its lower end having a swinging regulating gate. This spout is stationary, being secured on fixed supports without and independent of the casing. Although the spout is fixed during the progress of an operation, it is so arranged as to be readily swung out of the casing when not in use, and to be moved in again when needed. Supported under and parallel with the spout is a perforated pipe by which water is supplied. On the inner surface of the casing are a number of peculiarly arranged flanges, which not only keep the materials in motion, but direct them first to one side of the casing and then to the other, thus causing them to mix thoroughly and intimately. There are also adjustable shelves in the casing, which, while the mixing is going on, are turned to lie close to the surface of the casing, so that they are not in the way. But when it is desired to begin discharging they are turned inwardly, and coming up under the mixed material raise it in small and regular quantities and drop it into the discharge spout, from which it is delivered through its end-gate.

The most reliable place to procure pebbles: Muller's, 135 Montgomery street, opposite Occidental Hotel.

VENTURA is to build on oil tank to hold 30,000 barrels.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more voluminous and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth, 1884. Price, \$1, postpaid. Sold by DWYER & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part II; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DWYER & CO., Publishers, No. 252 Market St., S. F.

These are much needed books for miners and other practical men, by an intelligent, energetic and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

TWENTIETH Industrial Exhibition

OF THE

MECHANICS' INSTITUTE

Opens August 25th,
Closes Sept. 26th.

With a most Comprehensive display of

MANUFACTURES, NATURAL
PRODUCTS AND ART.

Grand Instrumental Concert Each Day and Evening.

SPECIAL FLORAL DAYS

Each Week. Over \$1200 offered as premiums for floral work.

ADMISSION:

Double Season Tickets.....	\$5 00
Single Season.....	3 00
Apprentices' Season.....	1 50
Child's Season.....	1 50

Single admission, 50c; Child's 25c.

Season Tickets to Members of the Institute at half rates.

W. P. STOUT, Secretary.

HILL'S TRIUMPH ORE MILL.

The successful working of this Mill warrants us in saying to the Mining Public that we are ready to make contracts for these Mills and to give a reasonable guarantee of their doing all we claim for them. We would respectfully refer to the letters below from Mr. B. F. Wilson, of Galena, Lander county, Nevada. Please write to Mr. F. A. Hill or myself for all and full particulars.

GALENA, NEV., May 8, 1885.

Mr. F. A. Hill—DEAR SIR: I think it is due you that I write you some of my impressions of Hill's Triumph Ore Mill I purchased of you in March. I got it in position, and have had it running for the past two weeks. The mill is in every way more than Mr. Hill claims for it. In quantity it will do all any one wants to do. The important part to me was, will it save the gold? My mine is quartz, oxidized iron and some clay. It had been a question with me, will the gold amalgamate? The gold is very fine. The result in the working of the mill has been satisfactory. It saves a high percentage of the gold and mostly inside of the mill. Below the plates and blankets we fail to find any free gold. The wheels and channels stand well so far, and show no signs of wear. The mill appears to be serviceable and durable, and no doubt Mr. Hill has struck the correct idea in his invention, and mining men should congratulate him on inventing an ore mill to take the place of expensive stamps. I am well pleased with mine, and think there will be more wanted in this camp soon. Respectfully yours, B. F. WILSON.

GALENA, NEVADA, July 15, 1885.—Mr. F. A. Hill—DEAR SIR: Since writing the above letter I have been running the Mill up to the present time, and have worked over 500 tons of ore, and will cheerfully recommend the Mill. Respectfully yours, B. F. WILSON.

For any Mine owner having a mine partly developed, with ore ready for crushing, we would put Machinery on the ground to work the ore, taking our payment from the proceeds of the rock. Farther particulars on application.

Manufactured by H. W. RICE,

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing;" and is for sale by the Trade generally.

ASSESSMENT NOTICE.

Grosh Consolidated Mining Company.—

Location of principal place of business, Room 39, Merchants' Exchange, San Francisco. Location of works, Storey County, Nevada.

NOTICE is hereby given, that at a meeting of the Directors, held on the 13th day of July, 1885, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 39, Merchants' Exchange, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1885, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday the 31st day of August, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale. San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING and REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATORS, WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

**Baker's Mining Horse Power.**

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

Room 7—No. 109 California Street.

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

**THE
"TRIUMPH" ORE CONCENTRATOR.**

**PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.**

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test, which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flanked by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

A Staunch Jigging Machine.

In a description of the systems of ore dressing and smelting at Příbram, Bohemia, read before the American Institute of Mining Engineers, by Ellis Clark, Jr., of Philadelphia, appears an account of a continuous working, two-sieved staunch jigging machine, for working the 6 mm. size of ore. This machine, intended for material from 4 to 20 mm. (0.16 to 0.79 inch), makes 140 strokes of 31.4 mm. (1.24 inches) a minute, and requires 2.9 horse power. The sieve is divided into two parts by a vertical wooden partition, A, (see engravings) 10.5 cm. (4.13 inches) high, which is fastened to a frame of small angle iron, and is supported by a wooden frame, which, fitting closely into the box, tends to prevent the water from splashing up at the sides. The sieve frame is provided with sheet-iron sides, and is suspended by two connecting rods, B, having an up and down motion given them by an eccentric which can be so regulated as to give a stroke from nothing to 2.07 inches.

The discharge of the heavy particles settling on the sieve is through a tube, C, 52.5 mm. in diameter, the aperture of which is closed by a puppet valve, and is opened at intervals, allowing the ore to run into a larger iron pipe, D, and thence into the receivers, E. The upper portion of the smaller discharge tube is surrounded by a low sheet-iron cylinder, covered by a sieve of 0.04-inch mesh, which, by being raised or lowered, regulates the discharge of material. That portion of the material which falls through the larger sieve collects in boxes of a triangular section, and is drawn off into receivers, by means of stop cocks, F, at the bottom. At the lower end of the jig frame is a curved piece of sheet iron, G, the object of which is to facilitate the passage of the waste material.

The transport screws for the *berge* and water are the same as those used in the middle corn jigging machines. The water which is lifted by the propeller pump passes into a wooden trough and falls on the second sieve. The automatic feed, H, of the material to be jigged is similar to that of the middle corn jigging machines. In the strict sense of the word this is not a continuous working jigging machine, inasmuch as the discharge of ore takes place only when a sufficient amount has collected on the sieve, when it becomes necessary to stop the machine.

By this operation two products are won, ore for stamping and ore for jigging. The ore for jigging goes to a neighboring jigging machine, from which, besides the waste, 3 products are obtained, all of which are generally rich enough to be sent directly to the smelting works. The 0.16 inch stuff goes to a jigging machine with 0.06-inch mesh, giving a waste and two products, which are also taken to the smelting works. The material under 4 mm., together with the water, is conducted through a gutter to a concentrating house directly opposite at a somewhat lower level.

The material falling through the trough previously mentioned (under 35 mm.) passes to the jigging house, and enters a revolving screen 3.28 feet long, 3.8 feet in diameter, making 25 to 30 revolutions a minute, and requiring 1.75-horse power. This screen is between two others situated at right angles to it, one of which is 10.37 feet long and 1 meter in diameter, and the other 9.33 feet long and the same in diameter.

In the upper revolving screen, which is provided with a sheet-iron trough, the material is separated into two grades. That which passes off the screen of 0.35-inch mesh is conducted to

rial: 1st. Ore to be farther separated by hand (*klaubwerk*), which gives the same divisions as were obtained in the separation of the larger sizes of material. 2d. Galena, which is sent

sulting in similar products for the smelting works and stamping-house to the one just mentioned.

The material going through the 9 mm. mesh of the upper revolving screen is conducted to the revolving screen on the left hand side, and there divided into four sizes, 0.08, 0.16 and 0.24 inch, and the material passing away from the screen between 6 mm. and 9 mm.

These products are all concentrated on five jigging machines, giving as a result galena, which is sent to the smelting works; a more or less enriched product, which is rejigged, giving ore for stamping; and the material passing off the jigs (*berge*), which is taken to the waste dumps. The slimes from these revolving screens are led in channels to the slime concentrating house and there worked.

Co-operation.

The principles of co-operation between labor and capital have been diligently discussed for many years. Numerous attempts have been made here and in Great Britain to carry on establishments on the co-operative plan, but few have been successful, and these only on a small scale. Wherever large works have been conducted in this way there has been some hitch or disarrangement, resulting in abandonment of the plan. Nevertheless there are many well-wishers of the human race who believe this co-operative principle will in the end be that on which many kinds of business will be carried on.

It will please these persons to know that at one place, at least, a co-operative community is doing well and gaining ground. It is in France. The association was formed 25 years ago, and is composed of some 1,400 persons. The capital employed has a preferential interest of five per cent. Further profits are divided among the workmen. Last year the capital share was £13,500, and the laborers' share was £76,000. The average wages of workmen is 30 shillings, six pence per week—higher than those earned by foundry hands in England.

Even this phenomenal success, however, does not seem to attract laborers to co-operative enterprise, there or elsewhere in Europe. There seems to be a fear among workmen that there is some trickery connected with such enterprises, where they are to share profits. The abstract principle of co-operation always appears to be correct, but in practice, as stated, there have been so far more failures than successes. It may be that the result should be attributed to individual management rather than to the principle; but the workmen have got an idea that co-operation is of little more use to them than any other form of carrying on work. Of course co-operation, if properly conducted, would do away with the serious feature of "strikes," which cause so much loss each year, both to capital and labor; but the capitalist and the laborer must be imbued with more confidence in the system than they now have, before any great advancement will be made in that direction.

It is said that quite a number of miners on Adams Hill and Prospect Mountain are holding their ores, confidently expecting to see silver appreciate in value shortly.

CHARLES CLARK, a successful and well-known miner, died at Sonora, Tuolumne county, last week.

the revolving screen on the right hand side, and there divided into four sizes; the largest, between 0.87 and 1.34 inches, passing off this screen, is removed to a separating table giving

direct to the smelting works. 3d. A more or less enriched galena (*bleierz*) which, after a sufficient amount has been collected, is rejigged on the same machine in conjunction with the raw

SIDE VIEW OF CONCENTRATING MACHINE.

two grades, sterile and rich. The latter is further separated into galena, which is sent to the smelting works, and ore for stamping, which goes to the stamp house. The sterile stuff goes directly to the waste dump. The material passing through the 22 mm. mesh is worked on a jigging machine, giving four grades of material: 1st. Ore to be farther separated by hand (*klaubwerk*), which gives the same divisions as were obtained in the separation of the larger sizes of material. 2d. Galena, which is sent

product from the revolving screen. 4th. Ore for stamping.

The material coming through the 16 mm. (0.63 inch) mesh is worked on a middle jigging machine, giving galena for the smelting works and ore for stamping. The 12 mm. (0.47 inch) size is worked on a middle jigging machine, re-

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Gold Bluffs and the Golden Beach of Humboldt.

[Written for the Press.]

It would be difficult to imagine the effect upon the minds and senses of E. Du Bertrand and companions, in 1850, as, when fleeing from the hot pursuit of the Indians, they rode in frantic haste along the beach at Gold Bluffs at low tide, and for miles found it streaked yellow with gold. According to the above named gentleman, they were more dazed by the extent of the shining yellow sand than they were frightened by the pursuing savages. They could not fully comprehend that it was gold, and one of the party managed to leap from his horse and gather up a pocketful of the stuff, which after their arrival in Trinidad, proved upon examination to be a fine quality of gold. Their story was regarded as a fiction, but the gold dust mingled with salty sand tempted some to believe, and an expedition was fitted out to work the fabulous Durado, but upon its arrival upon the ground a change of winds and tides had covered the golden deposit with gray sand, giving the whole thing the appearance of a grand hoax. But the individuals composing the party whose hasty flight had crossed the beach at just the right time when the black sand and gold had been laid bare by the action of the tides, knew what they had seen, and ere long the problem of the varying tides was unraveled, when commenced a long and successful period of beach mining at Gold Bluffs. Since that time it is estimated by those most familiar with the operations that some thing over \$3,000,000 has been extracted from the beach sand of Humboldt. But I have no desire to speak of this in an advertising way, but merely and practically as the evidence of a fact—the fact of a deposit of incalculable quantities of gold from which these golden beach sands have come.

Gold Bluffs are situated on the coast of Humboldt, between Trinidad and the mouth of the Klamath river, the upper edge being nine miles below the Klamath river, and the lower edge twenty-three miles above Trinidad, having a face of about seven miles on the ocean. There are several miles of abrupt, perpendicular bluff, three hundred feet high, composed of clean, gold-bearing gravel. This line of bluffs is the western end of a clearly defined and oblong territory of unbroken gold-bearing gravel, twenty miles long, and varying in width from two to five miles wide during its course, until near the coast, where it widens to the extent mentioned. What has been the source and action causing its formation, I do not attempt to describe technically, further than to surmise that it must have been a successive series of river channels formed by a gradual subsidence of a large river, from one beach to the next, as there is considerable difference in altitude between the northern and southern edges. Both at the beach and along the whole course of this gravel bed there is a problem in mining science which offers a broad field for operating mining capital and mining experimentalists. I see that numerous calculations are made, and notes are now being taken, having for their object the bringing of an ample volume of water on to the whole length of this gravel deposit. The chief operation, however, will be to wash the gravel at the bluffs and on the beach. That this deposit was made by a former trend of the Trinity river, making out independently to the ocean, is a plausible theory and easy of acceptance, and the known richness of the gold-bearing quartz, which is a marked characteristic of the Trinity watershed, at once solves the problem of this vast golden deposit.

But the acceptance of this proposition forces another query as to the former course of the Klamath proper. Here again is evidence of a former bed of the latter river, reaching also to the present coast line independently from the supposed former Trinity river channel, and has its terminus upon the coast about half way between the present mouth of the Klamath and Crescent City, also covering an extent of several miles along the beach. Like the Gold Bluff section, this deposit also extends in an unbroken line a little north of east, through a steep, mountainous country, abundantly supplied with good timber and water. Here, within 20 miles of each other, lie the auriferous gravel deposits of two large channels of former rivers or former channels of present rivers, as you please, cutting through and draining an exclusively gold-bearing quartz country—the quartz having undergone nature's milling process for ages, the dumps and concentrators having been suddenly arrested while in full action. The rivers have subsided to other beds; timber for every use has grown, and never-failing streams supply material and power to take up the process by human appliances for the collection of the disenchanted treasure. Neither of these fields bear upon valley districts, but have their existence and course entirely through steep mountains and canyons, finally terminating upon the Pacific Ocean from abrupt, beetling bluffs. Nature formed it for a mining country, placing rich treasure in the earth as the incentive, with

no conflicting values as an obstacle. I might say much more on special points, and some time, perhaps, I may, but these are general ideas which must come of any practical observation of this country, and such being the case, Mr. Editor of the MINING PRESS, why is it that almost invariably capital seeks some insecure, out-of-the-way place accessible only to "pack-trains" or "bull-teams," in which to make expensive mining experiments? Here can be secured U. S. patents to land containing gold, chrome, iron, magnesia, copper, etc., with timber and limitless water power to work them, coupled with great ledges of variegated talc from which could be obtained a building material in beauty and splendor anything that the present age knows, or has history, of, and all these lying within easy access of the great highway of nations—the Pacific Ocean. It is to my mind a question whether capital has that discernment with which it is usually credited. It is very like the poor wage laborer—likes to be humbugged by some mysterious golconda, where "distance lends enchantment to the view," instead of studiously, practically and laboriously analyzing the materials, advantages and opportunities lying at its feet.

WM. AYRES.

Gold Mining Reports.

It would be well if some of the managers of gold mines, says the *London Mining Journal*, were a little more explicit in their information as regards the operations at the mines, and the results therefrom, as the information often given is apt to be misleading to the initiated, and must be much more so to others. For instance the Oscar Gold Mining Company's report states that the clean-up from the last crushing averaged 8 dwts. 6 grs. of gold per ton of stuff treated, and the manager fully anticipates the next clean-up will average three-quarters of an ounce of gold per ton, and that the total expenses are covered by 10s. per ton, and it is stated the whole 50 head of stamps will be at work next Monday. Now what are the shareholders and the public to expect from this apparently glowing report? Has the manager got the mine so far opened out that he can keep a 50-head stamp mill at work on pay ore, averaging (say) from 8 dwts. to 15 dwts. per ton, if so the prospects must be bright. From the report given it would be naturally inferred such was the case, but if the clean-up, as reported, averaging 8 dwts. 6 grs. per ton, was only a small quantity of picked stuff, then the shareholders will be disappointed when it comes to the crushing of large quantities with poor results. It is no use dangling fond hopes before confiding shareholders instead of practical results. When giving the average result of a crushing it would be better to give the quantity at the same time—the amount of ore crushed, and whether fairly taken from the load or picked.

Men may be deceived for a time as to the prospects of a mine by the crushing of picked samples, but there can be no deception in the results of a 50-stamp mill when that is in operation and crushing, say 100 tons of ore per day, it will soon tell the true state of the value of the mine. The manager reports that 10s. per ton will pay all costs of working and management; if so, it is a low estimate for a London managed company. Assuming that to be correct, then all yields over that amount will be profit to the company, but if the yield be less, the more ore crushed the greater will be the weekly loss of working, besides the wear and tear of machinery and plant, and unless ore will pay for raising and crushing it is not good policy to work it merely for the sake of making a loss by doing a lot of work. When a mine is being opened up and development work going, it is, of course, desirable to run the stuff through the batteries of stampers, to test the ground as driven through, but if by development it is proved that there are large quantities of ore in different parts of the mine, some too poor to work, and other portions only payable, it is no use being deceived by the show of a large body of poor stone, while only a small quantity of payable ore can be profitably worked. There are many enthusiastic managers and directors of gold mines who hope to keep alive the excited imaginations of shareholders by reports which will not bear investigation by practical men, and when the tell-tale stampers are set in motion the visionary hopes are often rudely dispelled. No amount of persuasive oratory from a loquacious chairman will make up the deficiency between the real results and the fondly anticipated results of sanguine vendors and enthusiastic managers and directors. The hard-headed stamps have no mercy for visionary enthusiasts in gold mining, but often stamp out their hopes while crushing out the truthful results from the bulk of quartz operated on. In the operations of milling large quantities of ore, all exaggerated statements of inexperienced novices, and the wilful misstatements of so-called experts, get an awful crushing out of shape, in fact all paper misstatements get beaten into pulp that runs off with the slime. While it is pleasant to read the accounts of actual results from well-directed mining operations, it becomes monotonous to be so often reading reports of promises that are never fulfilled. It would be advisable that many of the managers and directors of gold mining companies were more cautious as to the information given, and that it should be so given as not to be misleading.

Determining the Strength of Explosives.

The following paper by S. Whinery, Somerset, Ky., was read before a recent meeting of the American Institute of Mining Engineers:

In these times of sharp rivalry, both as to price and quality, among the makers and vendors of engineering explosives, it is often desirable to be able to determine the relative energy or value of the various explosives offered for sale, in order to purchase intelligently, or, having contracted for a large amount of an explosive of a certain standard quality, to be able to ascertain if the manufacturer keeps his product up to the specified standard. The simple and inexpensive apparatus described below was devised by the writer while engaged on the improvement of the Tennessee river, at Muscle Shoals, under the direction of Major W. R. King, U. S. Engineers, in the summer of 1879. It answered the purpose so well that it is thought that a brief account of it may be of interest to other engineers. It consisted, essentially, of an old blacksmith's anvil and a common striking hammer, such as is used for driving rock-drills. The anvil was placed face downward on solid, level ground. In what was then the top of it, a vertical hole, one and one-fourth inch in diameter and about one and three-fourths inch deep, was made with a ratchet-drill. The surface of the anvil immediately around the drill-hole was made as true and smooth as possible with a file.

Next, a new striking-hammer, weighing nine pounds, with a turned and true face, was selected; and a handle 11 feet long and about one and a half inches in diameter, was fitted into it so that it projected about one foot beyond the hammer. The opposite or long end of the handle was mortised into a wooden axle about three feet long, turning on half-inch iron pivots, in posts set securely in the ground, in such a position as to bring the face of the hammer symmetrically over and covering the hole in the anvil, and so that when raised upward it revolved in a vertical plane perpendicular to the face of the anvil. Light horizontal wooden braces, extending from the ends of the axle to a point about half-way along the handle, secured the latter in position, and gave it additional stiffness. To further secure the hammer from lateral motion, the forward end of the handle, which projected beyond the hammer, had a vertical slit sawed nearly its full length, and was placed astride of a stout vertical wire secured tightly to arms projecting from an upright post; but this arrangement was probably unnecessary, and the friction between the wire and the wood doubtless detracted somewhat from the accuracy of the machine.

If, now, a small charge of any explosive be placed in the drill-hole, or firing-chamber, as it may be called, the hammer adjusted to its place covering closely the mouth of the hole, and the charge fired, the hammer will be thrown to a height proportional to the quantity and strength of the explosive used; and if equal charges of different explosives be successively fired, the heights to which the hammer is thrown will bear the same ratio to each other as the respective energies of the samples fired, and may be taken as a relative measure of the strength of each.

The essential parts of the apparatus were now complete, and it only remained to devise a ready means of firing the charges, and measuring the height to which the hammer was thrown. For firing the charge, an ordinary platinum fuse, exploded by a Ladin and Rand magnetomachine was used. Two spring-clips, made of tin and fastened to the upright post mentioned above, were connected by wires to the poles of the magneto. When the fuse and charge were in place and everything ready to fire, the bare ends of the fuse-wires were slipped into the spring-clips, and the circuit thus completed through the fuse. The wires of the fuse passed into the firing-chamber through a small notch or groove, filed into the face of the anvil, under the hammer.

To measure the height to which the hammer was thrown, a light index arm of wood about ten inches long was screwed to the top of the handle, just back of where it entered the hammer (the handle being left square at this point for the purpose), in such a manner as to allow it a slight horizontal motion. The outer end of this index arm was slit vertically with a saw, and passed astride of a fine vertical wire held in place by arms from an upright post. This wire carried, above the index arm, a small cork moving with just enough friction to hold it in whatever position it might be left. Lastly a rod, graduated into feet, tenths and hundredths, was fixed to the upright post so that its zero corresponded to the top of the cork when everything was in position for firing. When the charge was fired, the index arm carried the cork with it to the highest point reached, where it remained until its position was read off on the graduated rod.

A simple device for interposing a block of the wood between the anvil and the hammer, as the latter fell back after firing, to prevent the hattering of the face of the anvil, was also attached, but was probably unnecessary.

It was thought that by making the handle of the hammer so long, and using small charges of explosives, the path of the hammer might practically be considered a straight line, instead of a circle; but this did not prove to be the case. As the index-wire was tangent to the circular path of the hammer, the reading taken repre-

sented the tangent of the circular angle described by the hammer in its flight; but the true vertical height reached by the hammer was represented by the sine of that angle, and this sine and tangent were found to differ sufficiently to make it necessary to apply a correction to the index readings. This was easily done since, the radius being ten feet, the corrected readings could be taken directly from a table of sines and tangents.

It is evident that only the dynamical work done by the charge in exploding, is shown by this machine, and consequently its results would not correctly represent the relative value, for engineering purposes, of slow and rapid burning explosives, such, for instance, as blasting powder and dynamite. It should, therefore, only be used to compare explosives of the same general class.

The explosives experimented with at Muscle Shoals all belonged to the dynamite family. The charges used were generally ten grains of the number one class, or 20 grains of the number two class of dynamites. Each charge was weighed out as carefully as possible on a superior prescription balance (which turned readily with one-fourth grain), and wrapped in tissue-paper. Usually from 10 to 20 charges were prepared from each sample to be tested. When all was ready, a platinum fuse was placed in the firing-chamber, a charge dropped in with it, the hammer and index-cork adjusted to their places, the battery connected, and the charge fired. From 30 to 40 charges could be readily fired in an hour. It was, of course, necessary first to determine the average height to which a platinum fuse alone would throw the hammer, and this constant, when determined, was subtracted from the average height to which the hammer was thrown by the charge and fuse together.

The effects produced by equal charges of the same explosive were as uniform as could be expected from so crude an apparatus. In fact the records compare very favorably, in this respect, with those of the more careful experiments, made by General Abbott and others, with far more expensive and carefully made apparatus; and by taking the average of from ten to twenty tests, first throwing out such reading as were, from accident or other causes, manifestly wrong, the results doubtless represented fairly the relative value of the explosives thus tested.

THE REJUVENATION OF THE OLD MINING COUNTIES.—Not many years ago the old mining counties were considered worn-out, and fit to emigrate from; but one of the most encouraging of recent developments in the direction of fruit culture and grape-growing is in these same old mining regions. The settler finds good timber, free fire-wood, pure water, a glorious climate, soil which will grow the grains and fruits of the temperate, and often of the semi-tropical zones. Some men of energy have created for themselves fertile gardens on the hillsides, and there is room for thousands of others. According to the reports of the immigration societies, a steady stream of travel to the mining counties appears to have begun, and it is not hard to predict a great change there within a few more years. Shasta is receiving much new blood; the broad plains east of the Sacramento, at Redding, are dotted with cabins, and the red land foothills west of Anderson are nearly all occupied. Placer and Butte counties have become favorite spots for home-seekers and Nevada county is also attracting attention. Tuolumne, Calaveras, Mariposa, and the southern Sierra region are also coming into public notice. This very hillside where I sit would make an excellent place for an apple orchard, and the fruit would keep much later than that grown farther down the ridge, ten miles from here; and several thousand feet lower, peaches and grapes thrive. A slice of land a mile wide, and extending across this county, would be like a strip of territory from the Gulf to the Lakes, put into a condenser and reduced to thirty miles exactly. At one end there might be a date palm tree planted for a gate post, and at the other end an edelweiss from the Alps, for a warning that only lichens and snow-plants could grow beyond.—Paul Meredith in August Overland.

MINE LEASING.—The Silver City (N. M.) *Enterprise* says: The leasing of mines to parties who are willing to risk their labor on the property has been the means of building up many mining camps, and enlivening others that have been allowed to move along in a sleepy, sing-song manner. It is somewhat encouraging to see this means of developing claims being more and more looked to than ever before. During the present term of quietness in many of the districts it will no doubt prove beneficial to both miners and mine owners where such leases are given, and it will without a question be of greater value to the camp, district and county where such claims are being developed. There are many claims within a radius of 20 miles from this city that have good ore on the surface and no doubt it would pay handsomely were such properties to be worked intelligently. The closing down of several mines and the draft of men on several others has thrown a number of good men out of employment, and those who are unsuccessful in procuring work we would like to call their attention to the foregoing.

COIN is being counted at the Sub-Treasury at the rate of \$1,126,000 per day, and all in the vaults will be counted in a month. The disagreement about the method of counting has all been settled.

MECHANICAL PROGRESS.

The Work of Lubricants.

Very little of the amount of power that is required in textile manufactures ever reaches the working parts of the machinery. In spinning all the power that is needed at the spindles is the force that is sufficient to twist the slender film into thread at the speed of the spindle as fast as it is delivered by the front rollers. This force is barely perceptible and has lessened very much from the moving energy that appeared in the wheel-pit or engine room. It has paid tribute to every journal and lubricated surface, to every wearing part and moving piece of machinery, beside being fortified by the best of lubrication wherever a frictional resistance is found, making the cost of spinning energy very great. The power in its transmission must be divided equally among every spindle which occupies any portion of the spinning room; and as long as the supply of power can be measured in foot pounds, the cost of every pound in dollars and cents, and a fair estimate in the life of every journal, and the friction-reducing quality for every class of oil is known, it will be easy to determine the most economical basis to operate the machinery.

A lubricant that relieves the friction of a journal lessens the driving power, and if this can be done within the limits of its own cost, and this amount required, is all that is to be guarded against. An oil that the impurities will not work as much mischief in the destruction of the machinery, as all the power will bring in the coal pit, adds nothing to the running expense on the economical side of the account. There are mineral oils which have just got the grit-cutting qualities for bringing up the mill working machinery to a breakdown, that are noted for their lubricating properties. The lubricant that has respect for the life of the machine, and can lessen the wear as well as the power that is lost in the friction of the sliding parts, without adding resistance to the surface or a demand for a copious supply of the lubricant, is all that can be expected of any oil when its cost is considered, unless it has been in the care of an oiler who has little respect for quantity so long as the source of supply holds out. As it is, the different grades and their market value differ greatly in their lubricative worth in the cost of working energy, and must be selected with a view to its use a copious supply of the lightest oil for the high speeds and delicate bearings, and heavy lubricants for heavy bearings and where the pressures are great.

LOCATING LINE SHAFTING AND PULLEYS.—When a line of shafting is to be driven from another line in a room above or below, the placing of the shafts and pulleys is a matter of no small annoyance to some, and a few words to the point may be acceptable. One of the most important factors to be looked to in locating a pulley is the direction in which the pulley will deliver the belt. When a pulley once gets a fair hold it will "pull" for all it is worth, but in order to get a fair hold, the belt must be delivered in a proper manner from the other pulley. Bearing this in mind then, the main thing to look to in placing shafting for a "quarter turn" belt is the manner in which each pulley delivers the belt to its mate. The shafting must be perfectly level, and the pulleys, as near as can be, of the same size. Then if the center of the delivering faces of each of the two pulleys is brought to touch the same plumb line, the belt will "track" in good shape. The position of the pulleys may be slightly changed from the above to suit certain conditions, such as a short distance between centers of the two lines, or a great difference in diameter of pulleys; but if the shafting is placed with reference to the plumb-line, a very little adjustment will suit most any case. The best results, however, will be obtained when the pulleys are of the same size, and not greater in diameter than twice the width of belt, the distances (vertical) between centers of shafts being not less than three feet for every inch in width of belt. When the distance between centers comes within 18 inches for each inch of belt width it don't pay to use such a belt. It will not be out of place to remark that the two lines of shafting may be at any angle (horizontal) when the plumb-line principle is made use of, though with an acute angle the direction of revolution may be reversed.

MECHANICAL INDUSTRY, says a contemporary, is a characteristic feature of the present time, and its development has been so rapid that, by and with the instruments furnished, the laborers of to-day can accomplish four times as much work as did those who preceded us, 50 years ago. Mr. Gladstone once remarked that Great Britain was enabled, by her labor-saving machinery, to perform the work of 600,000,000 hand laborers, or as much as twice the hand labor of all the adult laboring population of the globe, unaided by machinery. With the rapid strides still making in improved mechanical appliances, we may look forward to the not very remote future when hand toil alone, so crushing and so wasteful, will be among the things of the past, and to the time when, by devoting only a portion of the day to manual labor we shall live in more comfort than now, and secure the leisure so necessary for study, culture and recreation. But as nothing can be accomplished without work, the inventors and manufactur-

ers who lighten its duties and shorten its hours are true benefactors, for they are always contributing something for the common benefit. The modern appliances which are continually being brought forward in this country, as labor-saving machines perform their work well. If they did not do this the manufacturers would soon find out that second and third rate work would amount to nothing more nor less than neglect of duty and waste of opportunity.

DRAWING WIRE FROM FLUID STEEL.—We have already made brief reference to the fact that wire is now drawn from fluid steel, instead of being produced in the ordinary way of wire drawing. The *Western Manufacturer* gives the following description of the way in which it is done. The process consists of an iron vessel, lined with refractory material, and provided with a manhole and a cover at the top, and securely closed. At the bottom, opposite the manhole, there is a cast-iron outlet pipe, through which passes a steel tube with water circulating around it exactly like a "tuyere," by which the steel pipe or die can be cooled. The inner end of the steel tube is lined with fine clay, where the very hot fluid steel mests it. The tube is plugged up by a steel stopper, and the liquid steel is filled into the vessel with liquid carbon oxide above it. The stopper being withdrawn the liquid steel is forced out by pressure of the carbon dioxide in a red hot rod or wire, which goes from the vessel into the rolling mill while still hot, and is there finished off. In connection with the above the *Manufacturer* says that a French engineer has recently made known a new process by which steel is produced direct from the ore. As briefly described, the ore, in a powdered condition, is submitted to the action of carbonic oxide gas at a high temperature in a cupola or blast furnace where it is reduced by the incandescent gas to pure iron or steel. This is all the information in regard to this process that has come under our notice.

THE "AGE OF STEEL," says the Cincinnati *Artisan*, is virtually "on," but is yet in its infancy. Even the most "scientific experts" do not know, absolutely, which is the better for many purposes, and until further and decisive tests and experiments are made, it is not best to assume that "steel" is preferable to "iron" for all articles heretofore made of the latter. The question has been raised, and is being considerably discussed, as to whether or not the loss of certain ocean vessels was due to explosions of their steel boilers. As the lost vessels have totally disappeared, leaving nothing to tell the story of their misfortunes, the cause of their destruction cannot be certainly known, but the matter alluded to has been brought forward in connection with the missing vessels. Bessemer steel is now used for a great many purposes for which crucible steel was heretofore considered necessary.

INDIA RUBBER OIL AS A RUST PROTECTOR.—An India rubber oil has been invented in Germany for protecting the surface of iron from rust. The rough oils, resulting from the distillation of brown coal, peat, or other bituminous substances, are subjected to further distillation, thinly-rolled India rubber, cut into small strips, is saturated with a four-fold quantity of this oil, and is allowed to stand for eight days; and the mass, thus composed, is subject to the action of vulcan oil, or a similar liquid, until a homogeneous, clear substance is formed. On the application of this substance—in as thin a form as possible—to a metal surface, it forms, after slow drying, a skin, which, as is alleged, insures absolute protection against atmospheric influences, the durability of the covering being another advantage in its favor.

WATER CIRCULATION IN A STEAM BOILER.—It is well known, says the *Mechanical Engineer*, that the modern marine boiler in general use has a sluggish circulation, owing to the large body of water underneath the furnaces removed from the direct influence of heat. To move this body of water, or to put it into circulation, an instrument called a hydrometer is used in many English steamers. This instrument is very similar in principle to the injector, being merely three nozzles, one inside the other, but all open at their bases. This is attached to the under part of the shell, near the bottom, with the nozzles directed downward, and around this shell, circumferentially. The result, when steam is admitted from an independent boiler, is to drive the water into rapid circulation.

SMALL STORAGE BATTERIES.—A New York company is now manufacturing practical electrical storage batteries of various sizes and prices. One of the smaller sizes, and which costs five dollars, is about as large as a powder flask, and weighs half a pound. Its power, when charged, is sufficient to run a four-candle lamp for four hours. To recharge costs 12 cents. Its chief use is for lighting very small lamps. The smallest made is about the size of a bean or the head of a shawl pin; such lamps are used by surgeons for examinations.

A COMBINED NAIL AND SCREW for attaching strips of wood to a backing has been patented by H. A. Schirmer, of Milwaukee, Wis. The device consists of a central hearing or nut from one face of which projects a nail, while from the other face projects a screw. The nail may be barbed or serrated if desired. The screw is forced into the backing, and then the strip or molding is forced over the nail. The entire device is made from one piece of metal.

SCIENTIFIC PROGRESS.

Color as an Aqueous Quality.

Has water a color? is a question, says the *Ice Trade Journal*, often asked, but not so easily answered. Perfectly pure water, when examined in small bulk, is colorless or so nearly so that its tint cannot be appreciated or designated. In large quantities it has color in the same sense, but not in the same degree, as wine or any other liquid has, and it varies greatly in different places. The ocean is blue where the water is deep, but in shoal water it is green. Lakes and rivers differ greatly in the color of their waters. Some lakes are blue like the ocean, others green, and some almost black. Lake Geneva, in Switzerland, is blue, whilst Constance and Lucerne are green. Brienze is a sort of yellow, whilst Thum, which is near by, is blue. In the State of New York there are lakes which appear blue, green, yellow and black. The Mediterranean, which is a salt water lake, is indigo.

Rivers differ still more widely in the tint of their waters. The Rhine, in France, for instance, is green, while the Danube and Rhone are a deep blue. In the famous Adirondack region of New York the streams present all the colors of the rainbow. Sacondago is yellowish. Fish creek is black or deep brown, while the Salmon and Mohawk rivers and Canada creek are without color. Black river is true to its name, while the Oswegatchie is white. The St. Regis is also black, while the famous Raquette is white. The St. Lawrence is blue. These tints and hues are not caused by mud or sediment, such as make the Mississippi coffee-colored, but belong to the waters and do not impair their transparency.

Now what is the cause of the difference in the color of the waters of these lakes and rivers? Are they real tints or optical illusions only? The subject has engaged the attention of the brightest minds of the day, including such students as Tyndall and Arago; but their theories are as different as the colors they explore, and fail to satisfy the intelligent student. The most plausible theory, we think, is that of Professor Spring, of the University of Liege, Belgium. According to him, pure water when seen in a deep mass, is blue, and that all the tints arise from the presence in the water of mineral salts in varying quantities, and of different degrees of solubility. Water which contains carbonate of lime in complete solution is blue, but if the solution is imperfect it will have a tinge of green, which will grow stronger as this point of precipitation is approached. This authority concludes that if lime is added to blue water, in which so much carbonate of lime is already dissolved, the water will become green. In proof of this he cites the fact that the water near the shores of lakes and seas, where it comes in contact with limestone, is generally of a greener tint than elsewhere.

We take the ground that absolutely pure water is colorless. Color in fluids is simply the presence of chemical and organic solutions which give both distinctive color and character to the fluids. These solutions exist in one quantity and quality in wine and another in beer, ginger ale, sarsaparilla, coffee, etc., the absolute extraction of which will leave any one of the fluids colorless.

Different bodies of water present their own distinctive colors, because of foreign soluble elements contained in them, as well as from the reflections of the sky, earth, and vegetation in their vicinity; but an entire ocean of absolutely pure water, if it could be lifted up in a flint glass vessel of sufficiently enormous proportion to contain it, would appear positively colorless.

How Sap Moves.

All plants obtain their nourishment in a liquid or gaseous form by imbibition through the cells of the younger roots or fibrils. The fluids and gases thus absorbed, probably mingling with other previously assimilated matter, are carried upward from cell to cell, through the albumen or sap-wood until it reaches the buds, leaves and smaller twigs, where it is exposed to the air and light, and converted into organizable matter. In this condition a part goes to aid in the prolongation of the branches, enlargement of the leaves, and formation of buds, flowers and fruit, and other portions are gradually spread over the entire surface of the wood, extending downwards to the extremities of the roots. We often speak of the downward flow of sap, and even of its circulation, but its movement in trees in no way corresponds with the circulation of blood in animals; neither does it follow any well-defined channels, for it will, when obstructed, move laterally as well as lengthwise, or with the grain of the wood. The old idea that the sap of trees descends into the roots in the fall, remaining there through the winter, is an error with no foundation whatever. As the wood and leaves ripen in the autumn, the roots almost cease to imbibe sap, and for a while the entire structure seems to part with moisture, and doubtless does so through the exhalation from the ripening leaves, buds and smaller twigs; but as warm weather again approaches, the temperature of the soil increases, the roots again commence to absorb crude sap and force it upward where it meets soluble organized matter, changing its color, taste and chemical properties. If this is not the case, we could not account for

the saccharine properties of the sap of the maple, or for the presence of various mucilaginous or resinous constituents of the sap of trees in early spring, because we find no trace of such substance in the liquids or crude sap as absorbed by them from the soil. The life of the tree, Mr. Fuller teaches, is all in the bark and sap-wood, the heart being dead, and serving the tree only to strengthen it mechanically, as shown in the fact that it may be removed entirely by decay, and still the tree grows on vigorously for centuries.—*Fuller*.

GROWTH OF COAL.—There is in the town of Phenixville to day an exemplification of the operations of nature as displayed in the formation of coal, where it can be found in actual process of transformation from vegetable matter to a soft soapy carbonic substance, and the latter gradually changing to lignite and then again into soft coal of the bituminous form. Go along the Pennsylvania Schuylkill Valley railroad, between the first passenger station of that system and the next one, and you will find a force of men cutting down the bank there, 18 or 20 feet high, and amid those rocks, perhaps 3 feet above the railroad track, you will observe a black seam. That black seam is a laboratory of nature. From above, before the Morgan house was removed and the surrounding bank, big trees sent their roots down through the soil and then through the crevices of the rocks till they reached the seam in question, which in time they filled with roots and fibers. The trees above died and the roots and fibers confined in the seam began to work, chemical changes took place, carbon was evolved, and coal was the result. The laboratory was opened by the building of the railroad before this slow process was fully completed so that you can find there to day the vegetables and carbonized matter and lignite and coal together, proving, indeed, that the popular thought that coal grows is true.

THE GREAT GLACIER OF ALASKA is said to be moving at the rate of a quarter of a mile per annum. The front presents a wall of ice 500 feet in thickness; its breadth varies from three to ten miles, and its length is about 150 miles. Almost every quarter of an hour hundreds of tons of ice in large blocks fall into the sea, which they agitate in the most violent manner. The waves are said to be such that toss about the largest vessels which approach this glacier as if they were small boats. This ice is extremely pure and dazzling to the eye; it has tints of the lightest blue as well as of the deepest indigo. The top is very rough and broken, forming small hills, and even chains of mountains in miniature. This immense mass of ice is said to be more than an average of a thousand feet thick, advances daily toward the sea.

SHAPE OF THE EARTH'S ORBIT.—Proctor remarks that a common error is the supposition that the earth moves in an obviously elliptical path, whereas it really appears to travel in a circle. Taking the earth's orbit when its eccentricity was very nearly at its greatest—850,000 years ago—the numbers 325 and 324 represent the actual proportion between the greatest and shortest axes of the figure described by our planet's motion around the sun. So that if a circle is drawn with a radius of three and one-fourth inches it nowhere departs more than the hundredth part of an inch from the ellipse which would represent with perfect accuracy the orbit of the earth 850,000 years ago, when it was so much more divergent from an exactly circular form than now.

THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The thirty-fourth meeting of the American Association for the Advancement of Science will be held at Ann Arbor, Michigan, from August 26th to September 1st. Bar Harbor, Maine, was the locality originally chosen, but as suitable accommodations could not be secured, it was changed by invitation to the University of Michigan. The absence of the students during the summer leaves their quarters available, and no difficulty will be experienced in obtaining ample accommodation. Reduced fares have been obtained.

PROF. HUXLEY, who has been ill for several months past, is about to retire on a well-earned pension from his duties at the South Kensington Museum. Mr. Huxley has seriously overtaxed himself, and his malady is nervous prostration, from which it is hoped by his friends that he may be speedily relieved. If the complete rest which he now consents to take should fail to restore his impaired health, he will also retire from the presidency of the Royal Society next November.

OLEOZE.—The German preparation called oleoze, so great a favorite in disguising unpleasant remedies and making most compounds pleasant to smell and taste, has the following composition: One part each of the oil of lavender, cloves, cinnamon, thyme, citron, mace and orange flowers, three parts balsam of Peru, and 240 parts of spirits.—*Am. Druggist*.

THE YIELD OF THE MAPLE SUGAR TREE.—A maple tree at Preston, Pa., made its 95th annual flow this season. It is on record in the annals of the family owning it that in 1790 sugar was made from the first sap it yielded and sent to Gen. Washington, who acknowledged its receipt in an autograph letter.

SAN FRANCISCO:

Saturday Morning, Aug. 22, 1885.

TABLE OF CONTENTS.

EDITORIALS.—A Staunch Jigging Machine: Co-operation, 129. Passing Events; The Tribute System; American Shipbuilding; Platinum; Stamps and Rolls, 132. Mariposa Gold; Idle Claims; Beet Sugar in California; Mechanics' Fair, 133.

ILLUSTRATIONS.—Staunch Jigging Machine; Side View of Concentrating Machine, 129. Beet Sugar Factory at Alvarado, Alameda county, Cal.; Twenty Thousand Tons of Sugar Beets at the Factory in Alvarado, 133.

CORRESPONDENCE.—Gold Bluffs and the Golden Beach of Humboldt, 130.

MECHANICAL PROGRESS.—The Work of Lubricants; Locating Line Shafts and Pulleys; Mechanical Industry; Drawing Wire from Fluid Steel; The Age of Steel; India Rubber Oil as a Rust Protector; Water Circulation in a Steam Boiler; Small Storage Batteries, 131.

SCIENTIFIC PROGRESS.—Color as an Aqueous Quality; How Sap Moves; Growth of Coal; The Great Glacier of Alaska; Snap of the Earth's Orbit; The American Association for the Advancement of Science; Oleozoe; The Yield of the Maple Sugar Tree, 131.

ENGINEERING NOTES.—Decay of an Iron Bridge; Reservoirs on the Upper Mississippi; The Canadian Ship Railway; A New Sleeping Car, 135. USEFUL INFORMATION.—Toronto, a New Dye Stuff; Oil from Soapstuds; Paper Bedclothes; Weighing a Hair; The Little Black Spots on Bananas; Where Anchors are Made; Don't Lick Your Stumps; Hay for Fuel; Lampblack from Natural Gas; Grindstones; A Good Copying Ink, 135.

GOOD HEALTH.—Comfort and Longevity; How to Cool a Room in Summer; Surgery of Dynamite; Soup; Hot Water for Sprains; Undine Perspiration of the Hands; The Blood, 135.

MISCELLANEOUS.—Gold Mining Reports; Determining the Strength of Explosives, 130. The Beet Sugar Industry, 134.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 136-37.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 140.

Passing Events.

They are having quite an ore boom in Salt Lake City, Utah, where the ore market is now very active indeed. Ore is coming in from all directions. It is all owing to the sharp competition between buyers and the rise in lead. The rise in lead has given a tremendous impetus to the mining industry in Utah. Mines in Ophir, Stockton and Dry Canyon that have been idle, and that have not been heard of for years, are shipping ore now. The samplers receive ten tons now where they received one before the rise in lead.

The closing down of the Bodie tunnel at Bodie, is another set-back for that camp, which is none too prosperous just now. The stoppage of work at the tunnel does not, however, affect the other mines.

The Mechanics' Institute Fair opens in this city next week. It promises to be the most successful of any ever held, many new features having been arranged.

A MINING DECISION.—In the case of Clary vs. Haslett et al., the Supreme Court has affirmed the judgment of the lower court in favor of defendants. The plaintiff had obtained a patent covering for a placer mining claim, on which the defendants afterward located a quartz lode. The court held that the provisions of the patent related only to the placer claim and excluded plaintiff from any claim to ownership of the lode.

The Tribute System.

In the year 1878, in the older workings of the Eureka mine, there was a very considerable amount of ore which had not been extracted from the ore chambers, either through oversight or improper mining. Many small ore bodies had also been passed over as too poor or insignificant to be worth removing, and there was reason to believe that undiscovered ore bodies of small size existed, as proved to be the case. In the year mentioned Mr. T. J. Read, superintendent of the mine, introduced the method of taking out ore on tribute, in order to utilize the large quantities of it known to exist in the earlier workings. The ground which was to be worked in this manner was divided up into blocks or "pitches," as they are called by the Cornish miner. These pitches were allotted to individuals or companies (which usually consisted of two men), and 10 per cent of the assay value in gold and silver of all ore above \$40 was paid to tributers. This rate was continued for about one year, when it was raised to 15 per cent. Then a new schedule of prices was arranged, based upon the assay value of the ore; \$6 per ton of 2,000 pounds was paid for \$40 ore and \$30 for \$100 ore, with proportional prices for intervening grades.

Finally, in 1881, still another schedule of prices was adopted: \$2.50 was paid for ore assaying \$30 per ton, and 50 per cent of all it assayed above \$30. Thus \$65 ore brought the tributer \$2.50 plus \$17.50, or \$20. These figures we take from Mr. Curtis's recently published monograph on Eureka district. The company furnishes tools, hoists the ore, and transports it to the smelting works. The tributer supplies his own candles, fuse, powder, etc., as well as timber, huying them from the company at or near cost, handles his own waste, and delivers his ore at the shaft.

When a tributer owns a prospecting drift and does not succeed in finding ore, it is not customary to charge him with powder, etc. In those cases where a tributer strikes a very large body of ore requiring timbering in large sets, the ground is taken away from him after he has been allowed to make remunerative wages. Such a fortunate strike, both for the tributer and the company has seldom occurred since the tribute system was introduced at Eureka. The system has been introduced at other mines in this district, and in other districts also.

In speaking of the advantages and disadvantages of the tribute system, Mr. Curtis states that the tributers sometimes fill up drifts and other workings that ought to be left open, and injure their mine generally, but this is the case only when they are not properly restricted and the foreman of the mine does not attend to his duty. Ground worked under the tribute system soon acquires an ill-kept, disorderly appearance, not calculated to impress visitors favorably. The approbation which orderly galleries excite in the mind of a mining man is not founded on love of neatness, however, but on the fact that it facilitates the operation of the mine. It must be remembered that the ground is not given over to tributers until it has been practically abandoned by the company, and that the ore which has been obtained in this manner is nearly clear gain; and since the ground left by the tributer is entirely valueless, there is no object in maintaining it in working order. In fact, extraction under the tribute system is analogous to cutting away the pillars of a coal seam rather than to move regular mining operations.

Although some tributers are fortunate and discover valuable deposits of ore, by far the greater number do not make miners' wages, but men generally, good miners in particular, prefer to run the risk of making nothing, if at the same time they have the chance of getting extraordinary remuneration for their labor. The difficulty of obtaining continuous employment at day's pay, also acts as an inducement to tributers. As the large ore bodies are worked out the demand for such labor decreases, and many miners are thrown out of employment who prefer to work on tribute to seeking their fortunes in new camps. As adopted in Eureka district, the tribute system has been very successful.

THE PRESS OF JANUARY 30.—We shall be glad to receive a number of copies of the MINING AND SCIENTIFIC PRESS of January 30, 1885, our supply of that issue being short. We will pay ten cents a copy for them.

American Shipbuilding.

It is pretty generally understood that there has been a very great decline in American shipping interests since the war. There is not now one ship carrying the American flag where there were ten, some 20 years ago. This fact has been greatly deplored by the people of this country, and many plans, more or less impracticable, have been suggested to remedy the matter. It has been considered in some measure a national disgrace that our foreign trade should be mainly carried on in foreign bottoms; and that with all the great steamship lines crossing the Atlantic not one should carry our flag. In fact, had it not been for the law which prevents foreign vessels engaging in coastwise trade in the United States, what few American ships there are would have little to do.

In discussing this subject, however, it is often forgotten that people do not go into business for patriotic reasons, and while it is all very nice to see our glorious old flag in every part of the world, the main question is, "will it pay?" As long as there was much money in the shipping business Americans went into it heartily, but when competition became great, and prices low, they dropped it.

It is conceded that ships can be built cheaper in England than here, interest is lower, wages are less, the captains will serve for half the salary Americans will, and the ship can be run for less money. Therefore, they can make money at freight rates which would entail loss on American ships. Gradually the old ship owners in this country sold out, seeing little future in the business. These men understood that business better than the general public, and it looks now as if they were wise, after all.

The shipping interests of the whole world are in a bad shape, and those of England, being the largest, are the worst. There are "miles of ships" laid up in English waters, with which their owners can do nothing. The largest steamship manager and owner in the north of England has announced to his co-owners that owing to the continued depression of the freight market he has determined to lay up the whole of the vessels of his fleet, as they arrive in England. In the American trade with England the competition has been so keen that money has simply been thrown into the sea by all the great lines, in the hope of cutting down their weaker rivals. The French and German subsidized shipping is a thorn in the side of even the English ship owners, who underbid ours, so there is no immediate prospect of improvement or increase in American bottoms.

Although, as stated, many people deplore the decline of American shipping interests, it is very probable that we are just now better off with few ships than we should be with many. An Englishman of prominence recently expatiated in glowing terms on the fact that the American flag had practically disappeared from the Atlantic trade; and no less an authority than the *British Trade Journal* rather compliments us by saying that "the circumstance is strong evidence of the innate sense of the Americans," as the business is hardly worth the doing. For several years past the grain trade between the port of San Francisco and Great Britain has been carried on at such rates that ships have made no money. There are some ships in this port now that have been here two and even three years waiting for a remunerative charter. The Americans have held on to the whaling business and are making money in it with their vessels, but outside of that they are just as well off, for the present at least, in having no ships.

The increase in freight rate on the railroad has temporarily driven the Colorado ore buyers from the Wood River market. The agent of the Pueblo Smelting Works says the rate to Omaha and Kansas City, he understood, remained at \$25, while the rate to Denver alone had increased from \$20 to \$25. This was, therefore, a discrimination against the Colorado smelters. It had come without notice, too, so that it caused some loss to both smelters and miners.

ATTENTION has been drawn to the new machinery for extracting the salt from the waters of Owens lake. A large number of vats have been prepared for evaporating the water, and will have the water turned into them as soon as the bottom of each has become sufficiently hard to prevent evaporation.

The condition of the Salt Lake ore market is just now very encouraging to mine owners and business men. It has not been so active for years.

Platinum.

Platinum occurs much more frequently and in larger quantities than is commonly supposed, as is also possibly the case with other metals of the same group, such as iridosmine, etc. Search is very seldom made for it, and it would be apt to escape the gold-saving appliances, most of which depend on amalgamation. It is found generally in small grains, associated with the black sand in the sluices.

Among the localities in California reported as showing the presence of platinum are the Spring Valley, Magalia and Morris Ravine mines, in Butte county; the Bunker Hill, Del Norte and Happy Camp mines, in Del Norte county; Weed's Point mine, Yuba county; Lincoln, Hart & Henry, Oak Grove, Fort Goff creek and Thompson creek mines, and in the placers of the south fork of the Salmon in Siskiyou county; the La Grange, in Stanislaus county; the Chapman & Fisher, the Gribble, Slatterly and Wiltshire mines, in Trinity county. In Colorado traces are found in the Cash creek placer, Chaffee county, and in the L. H. Arthur and Edward mines, Clear Creek county. In Oregon small quantities have been found in Grass creek and Evans creek, in Jackson county, and at Sunken creek, Josephine creek, Silver creek, Galice creek, Des-selles & Co.'s, and Blue Gravel mines, in Josephine county.

The quantities reported found are very small, being from a fraction of an ounce to a few ounces per clean-up, and in most cases are saved merely as a curiosity. In the absence of systematic tests, it would be premature to predict positively that the saving of platinum is likely to become an important adjunct to the gold placer-mining industry; but it seems reasonable to suppose that such a possibility exists, and that in some of the many localities where platinum is likely to occur future experiments may lead to economic results. With the improvement of appliances designed to save "rusty" gold by specific gravity alone—such, for instance, as a system based on retaining a large bulk of black sand and other heavy material in the sluices and undercurrents, and subjecting it to a second treatment by mechanical concentrators, probably larger quantities of platinum will be found.

Stamps and Rolls.

It is worthy of note, that in the great International Exhibition of Inventions, now open in South Kensington, where there is considerable mining machinery, the exhibits show that the practice of engineers leads to the substitution of rolls for stamps even in the reduction of gold and silver ores, for which the stamps have long been considered essential. It is said that this change of practice is in accordance with the experience gained in the case of flour milling.

The plan of using rolls for crushing ore is as "old as the hills," and there are many forms of them in use. The commonest one being known as the "Cornish roll." When they began to crush ore in this State these rolls were tried in many places, and even of late years they have occasionally been put in use. But when they came in competition with the California stamp mill they were never so economical or as rapid in work. In places where dry crushing was carried on they have done well, but most of our crushing in this country is done wet, so that the stamp has held its own.

There is one thing, however: there is not much room for improvement in stamps, so if any one wants to invent crushing appliances he goes to rolls, rollers, grinders, rockers, wheels, etc. And as this exhibition is one of inventions, perhaps it accounts for the preponderance of roll devices over stamps. In this country the stamp mill has been carried to perfection mechanically, and there are no patents on the general plans. Most of the quartz-crushing appliances invented even on this coast of late years have not been in the direction of stamps, but of revolving devices, and some of them have been doing very good work, but the stamp shows no signs of being generally displaced. It may be that the same thing has occurred abroad, and that inventors of quartz-crushing machinery have been compelled to get up various rotating devices in order to show anything new.

LEADVILLE smelters are still running less than half the capacity of the works.

Mariposa Gold.

We had a conversation this week with Capt. Diltz, of the Diltz mine, Mariposa county, who is visiting San Francisco. We were shown some very handsome quartz gold, washed from the decomposed strata which occur to the west of the main vein of the mine. Capt. Diltz has been working this mine alone for some 14 or 15 years, and has got it well developed. He has sunk small shafts, run drifts, stoped and washed

that this hill was the main source of the gold found in the rich gulches near by, which were washed in early days by placer miners. There is water power for a mill three and a half miles away, but there are no mills working near by. The old mills of the Fremont grant are about six miles distant. Capt. Diltz is getting along in years and is desirous of quitting active work, but having been so long developing his claim he wants to see a 100-stamp mill at work on the quartz from it before he retires. Some

Idle Claims.

It is a common habit among a certain class of prospectors to rush to a district and make locations as near the first bonanza as possible, then they scratch up the ground vigorously for a short time, but if they find nothing they are soon disheartened or unable, through poverty, to hold their claims without working, and under this stress sell out for a song, or hold on to their claims as long as the laws allow,

Beet Sugar in California.

California has now the only beet sugar factory in operation in the United States. This creditable fact is given due prominence in a very interesting special report by Prof. H. W. Wiley on "The Sugar Industry of the United States," which has just been issued by the Department of Agriculture at Washington. The engravings on this page are reproduced from Prof. Wiley's report, and will be viewed with much interest by our readers, for comparatively few of them have visited the establishment, which has been unobtrusively progressing for the last few years, demonstrating the fact that sweetness can be profitably drawn from California soil.

We present the engraving at this time to accompany a very interesting essay by John L. Beard on beet sugar on the Pacific Coast, which may be found on next page of this issue. Mr. Beard lives near the factory and has grown beets for its use, and may therefore claim to be personally familiar with the enterprise which he advocates. Certainly the subject is worthy of careful consideration. The Alvarado factory is owned by the Standard Sugar Company, which was incorporated in 1879. The Company consisted of A. E. Davis, O. F. Giffin, E. H. Dyer, Prescott, Scott & Co., J. P. Dyer and Robert N. Graves, with a capital of \$100,000. It was soon ascertained that more capital was needed and the company re-incorporated under the name of the Standard Sugar Refinery, with a capital stock of \$200,000. The officers are: O. F. Giffin, president; J. P. Dyer, vice-president; E. H. Dyer, gen. sup't; W. F. Ingalls, sec'y; trustee, O. F. Giffin, R. N. Graves, J. P. Dyer, G. H. Waggouer, and E. H. Dyer. This company has made a success of the business from the start. Mr. Beard's essay gives a sketch of some of the important features of the company's work. The factory itself is shown in the upper engraving, and the lower one will give some idea of the mass of material which passes through its processes. Unfortunately, so large a pile of beets is not a safe arrangement, for California seasons are peculiar. The unusual mildness of the last winter caused the beets in parts of the pile to heat and their sugar contents were interfered with. In ordinary winters no evil would have resulted. At the Eastern factories, which have had experimental existences, there have been losses from frozen beets; in California the beets may become too hot. California is famous for unusual things. Fortunately, it is very easy to put the beets in smaller piles and thus prevent their heating. Jack Frost is not so easily cheated of his victims. Prof. Wiley's report treats also of sorghum, cane and maple sugars. It is one of the most interesting which has been issued by the Department of Agriculture.

The Mechanics' Fair.

The Mechanics' Institute Fair will open in the Pavilion in this city on Tuesday, Aug. 25th. We stated last week that Mr. Bassett, one of the directors, who had taken a trip through the southern counties, found much interest in the display of country products and resources at the fair. More in detail, Mr. Bassett's report embraces the following items:

The people of San Luis Obispo county are manifesting considerable interest in the fair, and have appointed a committee to prepare an exhibit of fruit and wheat.

At Lompoc, Santa Barbara county, the committee, which made such a fine display of fruits and vegetables at the New Orleans Exposition, will endeavor to send an equally fine exhibit to San Francisco.

Ventura will make a complete display of all the products of the county excepting live stock. The exhibit will include in its variety everything produced in the county from coal oil to honey, and cereals will form no mean part of the display. Headquarters have been opened and are in charge of the ladies, who will receive and arrange the exhibits. Mr. Thorp, their agent, has secured a space 30 feet square in the Pavilion, and Mr. Blackstock, another agent, will arrive here on the 21st. The citizens of the county have published a large pamphlet showing the resources of the county, and will distribute 15,000 of them at the fair. A special display of dried and preserved fruits will be made.

Fresno county has also appointed a committee, which is zealously at work preparing an exhibit of fruits from the different colonies settled in the county.

What is being done by these counties should stimulate others to exhibit. There is time enough remaining, if the effort be made at once, as the fair holds for five weeks.

There will be many features of the fair which will interest visitors, and of them we shall give an account at another time.

BEET SUGAR FACTORY AT ALVARADO, ALAMEDA COUNTY, CAL.

away decomposed material, working by himself, and now has the mine in such a shape that he can tell pretty well what there is in it.

At the south end of the ledge is an open cut 110 feet wide, exposing a large mass of decomposed material. The quartz is broken down, and broken up on the floor with a sledge, and water allowed to run over it and through a flume. All the small nuggets are collected and

very large nuggets have been found in this mine, one of them weighing 106 ounces. The gold now sluiced out is very coarse, indeed, showing no signs of "wash" as it comes directly from the quartz. The mine is a very peculiar one, indeed.

The Granite Mountain mine, at Philipsburg, Montana, shows the following good record for

hoping for a change for the better, for they are as hopeful as Micawber. They may be skilled miners, but as a general thing this class of prospectors are not industrious. They demand quick returns, and have no capital to expend in deep mining. One may induce some capitalist to furnish the funds required for a share in the claim; but this is oftener done in surface work; as for mining on a large

TWENTY THOUSAND TONS OF SUGAR BEETS AT THE FACTORY IN ALVARADO.

the quartz laid aside for stamping. The fine quartz is also kept, and some of this is very rich indeed. Capt. Diltz has some 1000 tons of rock now ready for milling, but he has no mill.

The main vein or fissure stands at an angle of some 60 degrees, and a large number of small veins lie flat against the foot wall of the main one. The fissure is from a few inches to 14 feet in width. Capt. Diltz purposes to run a tunnel for 1700 feet from the north to the south end of the mine, giving a raise or lift at the highest point of about 500 feet. The mine shows not only on the surface a large amount of auriferous quartz and vein matter, but also indications

the past six months: Bullion shipped during June, 1885, amounted to \$111,499.53, and for the six months ended with June 30th, \$508,543.53. The net product of the 20-stamp mill since December 1, 1884, to July 22, \$718,927.63. Total dividends paid since April 8, 1885, \$260,006.

For the last quarter the Paradise Valley Mining Company paid out \$35,992.56, and its gross yield was \$48,306.78, leaving a net profit subject to taxation of \$12,314.22, the tax on which amounts to \$320.17. As under the Act of the late Legislature only the net profits of mines are taxed, several companies escape taxation altogether.

scale, more perfect organization and more hands are required. The capitalist will not make advances unless he controls their expenditure, and the prospector dislikes to let the control of his claim pass out of his hands, fearing that he may be cheated out of what he has left. Hence claims in many camps have laid unproductive from year to year, because their owners were too poor to work, unwilling to sell, and unable to organize a company on a satisfactory basis. The risks and expenses of silver mining are so great that only men of large wealth can afford to incur them, and it is natural that the control of such mines should pass into their hands. No laws can be devised to prevent this condition of things, even if such laws were desirable.

The Beet Sugar Industry.

Special Adaptions of the Pacific Coast.

The following extracts are from a paper recently read before the Chit-Chat Club by John L. Beard, of Centerville, Alameda county, and furnished for publication in the PRESS.

The manufacture of sugar from the sugar beet root was unknown at the commencement of this century. It was the outgrowth of necessity. The continued wars of France with England made the importation of sugar into France very hazardous and some means had to be devised to make France independent in that respect of the rest of the world. Under the patronage of the great Napoleon Bonaparte the beet sugar manufacture first came into importance, and like all enterprises to which he turned his attention it immediately came forth as from the touch of magic. The premiums he offered for the best methods for its manipulation brought into service the best chemical talent as well as the best mechanical genius of France. Under the empire, France manufactured all her sugar, but with the downfall of Napoleon and restoration of peace, the free re-admission of West India sugar nearly destroyed the production of beet sugar, and it became necessary to protect it by high duties. From that time it rapidly increased in importance, amounting in 1838 to 42,000 tons, in 1858 to 150,000 tons and in 1884 to 507,509 tons. From France the manufacture of beet sugar was introduced into Belgium, Holland, Germany, Austria and Russia and other countries, till now, so rapid has been its growth it nearly equals the production of cane sugar. The sugar production of the world is about 7,000,000 tons; of that 3,000,000 tons is beet sugar. The German Empire at present takes the lead in the working of sugar beets, and what they have succeeded in should be an example and incentive for our imitation on the Pacific Coast.

In this country sugar is our greatest import. Its annual consumption in the United States is now about 3,000,000,000 pounds, and if the beet sugar industries were established this demand could be met by California, Oregon and Washington Territory. All business would be stimulated, and a most important problem solved. The German Empire contains 133,000,000 acres of land. California, Oregon and Washington Territory have 226,000,000 acres or 93,000,000 acres more than the whole Prussian Empire. In the Prussian Empire there are \$250,000,000 invested in beet sugar factories. To produce beets for these factories requires the cultivation of 700,000 acres of land. To work this land and convert the sugar requires the labor of over 300,000 hands, besides millions of dollars invested in horses, mules, implements, etc.

There was over 1,200,000 tons of beet sugar produced in the German Empire in 1884, or equal to the entire amount of sugar consumed in the United States. If Germany, with 93,000,000 acres less of land than is contained in California, Oregon and Washington Territory, can produce that amount of sugar, why cannot the Pacific Coast, with better soil and climate, produce the 1,200,000 tons of sugar consumed in the United States? All that is required to do this is the necessary amount of capital and skill.

We can produce sugar as cheaply here as it can be done in Europe. Immediately upon the ratification of the reciprocity treaty with Hawaii, capital rushed there and invested in every acre of land fit for the production of cane, while here at our very doors lie millions of acres that will produce more sugar to the acre, and at less cost per pound, than the average lands of those islands—the production of Hawaii being about 60,000 tons. New York imported more beet sugar last year from Europe than all the cane sugar raised in Hawaiian Islands. The raw sugar consumed in the United States amounts to \$120,000,000 annually. There is no reason, except lack of enterprise, capital and technical skill, why we on the Pacific Coast should not produce it all, and \$120,000,000 distributed among us would make very lively times.

Beet Sugar in California.

It may be urged against the industry that it has been tried and failed on several occasions, but each failure, first in the old factory at Alvarado, second the one in Soquel, and the third at Isleton on the Sacramento, can be explained in such a way as to more clearly demonstrate the sure success of factories suitably located and properly managed. The success of the industry in California has been demonstrated beyond all question by the Standard Sugar Company at Alvarado. That factory has made this year 1,250 tons of refined sugar, about four times the production of all the sorghum mills in the country, and that, too, without the aid of the \$100,000 Government bonus.

The Yield in This State.

The sugar beet in California yields over 10 per cent sugar, and produces more sugar per acre than the average cane lands, being from 3,000 to 6,000 pounds per acre according to the yield of beets, which in the last season has run from 15 to 30 tons per acre. We see by this showing that the ordinary yield of sugar in California exceeds that of Louisiana's best yield by one-third; and our best yield is more than three times as great, and equal to the best cane lands of Cuba. In the cultivation of wheat one-

ton per acre is considered a splendid crop, and two tons is most extraordinary; yet in the past season one ton and a half of sugar per acre was the lowest average; and one ton of sugar, even at the present low prices, is worth four or five tons of wheat.

Beet Growing and Fertility.

It is sometimes urged that beets may do well for two or three years and after that the land will be exhausted, but actual experience at Alvarado has demonstrated that beet cultivation is not near so exhausting to the soil as that of sorghum, or as the cane in Louisiana and in Hawaii has been. In fact, I doubt whether there is any crop annually produced and gathered from the same land that is less exhausting than beets or that can be more successfully followed one crop after the other. Potatoes, we know, exhaust the land after three crops. Wheat lands require a rest or change after the fourth crop; but the yield of beets seems to increase with succeeding years and the finer cultivation that is required. One tract of land, by way of illustration, the first year, being on barley stubble, yielded 14 tons to the acre; the second year 19 tons; third year 23 tons, and fourth year 39 tons. Of course this does not apply to all lands, as it is an extra fertility that will make a return of 39 tons, but the same rule is observable in other lands. The yield so far has invariably increased where beet crops have followed each other, showing conclusively that the crop is not so exhausting as many others. One reason of the improvement in the productiveness of succeeding crops is on account of the deep and thorough cultivation.

Methods of Beet Growing.

In the raising of beets the land should be plowed the first time from 12 to 14 inches deep and barrowed fine; then later in the season, about two weeks before planting, it must be plowed again, not over five or six inches deep, and thoroughly pulverized, harrowed and rolled. The seed is planted about 15 pounds per acre, drilled in rows about 15 inches apart; as soon as possible after the plant appears, the rows must be thinned out, leaving the beets about four inches apart. The work of thinning out, hoeing, as well as digging up the beets, cutting off the tops and sacking the beets in open sack, and loading them on wagons to be delivered to the mill, is done generally by contract with Chinamen, who do the work for \$1.30 to \$1.50 per ton.

The seed is sown from March to the middle of May dry grounds, of course, sown earlier than damp bottom lands. The harvest time often commences by the middle of August and continues through November and must depend on the maturity of the crop, which can be determined by analysis of the beet.

Testing Beets.

The saccharometer cannot be depended upon, as it indicates the amount of solid matter in the juice. The percentage of sugar is determined by the polariscope, but as the salts held in the juice enter into the manufacture of the sugar, the percentage of the saccharometer has to be taken in account with the percentage indicated by the polariscope. Thus, if the saccharometer shows 15 per cent and the polariscope 12 per cent, then 12 divided by 15, carried out will show what is known as the "purity co-efficient," eighty per cent. Beets with a quotient less than 75 per cent and eight per cent of sugar will not pay to work. It is on this account that I consider the working of sorghum unprofitable, because its purity co-efficient is often at 70, and never up to 80. Some beets may contain a high percentage of sugar and also show high percentage on the saccharometer, and still cannot be worked profitably. Suppose a case where beets contain 20 per cent of sugar by the polariscope and 30 per cent by the saccharometer: the sugar quotient would show but 66 per cent, which would be too low for working; while, on the other hand, beets that would only show eight per cent of sugar and 10 per cent on the saccharometer would work more profitably. The alkali and salts neutralize the crystallization of the sugar. We have a somewhat analogous example in the working of gold mines: some quartz assays hundreds of dollars per ton, but cannot be milled profitably, owing to sulphurets and rebellious metals which prevent the collecting of the gold.

Profits of Beet Growing.

A farmer, in raising beets at \$4.50 per ton for a factory, where he raises twenty tons per acre can easily clear \$2.50 per ton, or \$50 per acre. If the yield is under twenty tons, his profits will be proportionately a little less; and above twenty tons his profits will be more in proportion. On a thirty-ton yield his profits would be \$78 per acre, which is about as profitable a crop as can be raised, taking one year with another and the chances of an uncertain market. Besides the beet crop comes on when other work is disposed of. The planting of the beets comes when the grain sowing is over and before the haying season; then the beet harvest comes just after the grain harvest and just before the plowing season. It makes a fine change for the land, and the rotation from beets to grain or onions and potatoes is better than a year's rest to the soil. No summer fallow is necessary where beets have been raised.

Sketch of the Manufacture.

I will speak briefly of the manufacture of the sugar. As the sugar is contained in little sacks like cells, it is generally conceded that the beet, after passing through the washer, should be sliced into V-shaped strips about one-quarter of an inch wide; this cuts the cells in

two and leaves them open; whereas, a grater would lacerate the fiber and close some of the cells. It is next passed through a series of diffusion batteries, where it is subjected to the action of hot water, which takes up the sugar in solution. Lime (two or three per cent), is then added, and carbonic acid is admitted and the temperature raised. The lime enters into combination with any free acids in the juice, combines with gum and forms the fatty substances into insoluble lime soap. The salts, soda, potash and magnesia, which were combined with acids, are liberated, while the excess of lime combines with sugar, forming sucrate of lime, which is decomposed by carbonic acid, liberating the sugar and forming the lime into carbonate of lime. This last process is carried on in the defecation pans from which the juice passes through the carbonization pans and then passes through the filter press of clothes which separates the scum from the clear juice. Then the juice is passed through long filters filled with animal charcoal which purifies it, as far as practical, of remaining impurities. It is then boiled in the vacuum boiler to the proper consistency, when it is drawn off and cooled. It is then ground up to a soft, pulpy consistency, when it is placed in centrifugals, which are cylinders lined with fine brass gauze. They revolve from 1,000 to 1,200 times a minute, throwing off all the syrup and water, leaving nothing but the white crystallized sugar in the pan.

The Alvarado Enterprise.

What facts I have gathered on this subject have come from the Standard Sugar Factory, of Alvarado, and I have not the least doubt of their accuracy, as the company has now been in active operation for more than six years and has successfully passed through six campaigns. In that time it has paid to the farmers in the neighborhood from \$60,000 to \$90,000 a year for beets. The farmers have never done so well, and blacksmiths, carpenters, teams and laborers are all kept busy and the factory has earned in profits in four campaigns \$104,000 on an invested capital of \$125,000. Since its commencement it has made altogether 9,500,000 pounds of refined sugar. The first year it did not declare any dividend and this last year, owing to the low price of sugar, the directors of the company have thought best to hold their stock in store and not sell till they can realize more, although they could sell what they have at the present price, and still realize a profit on the year's run; notwithstanding a loss, in addition to low prices, of over 2,000 tons of beets, for which they paid out \$10,000, and which, on account of the warm, dry winter, did not retain convertible sugar and had to be abandoned. The mill at Alvarado has a capacity of 80 tons of beets per day and sugar can be turned out for 5½ cents per pound; with a mill of 200 tons capacity it is thought that refined sugar can be made for four cents per pound.

The refuse pulp from the factory makes a fine feed for dairy cows, or, in addition with grain, is good for fattening beef cattle, and where the business is carried on extensively it will be no small factor in the question of beef supply.

Alameda county alone could supply all the sugar that at present is consumed in California, and it would so diversify her agriculture that there would be a local home market for all the rest of her products. What would apply to Alameda county applies to at least one-third of the other counties in the State. There is only a certain part of the United States suitable to the cultivation of the sugar beet, and that includes California, Oregon and Washington Territory, and a small strip of country along our northern boundary. The sugar beet thrives without irrigation, and in our dry years, as the present one, the beet crop turns out better than most any other. In fact, the crop this year, where wheat is almost a failure, beets promise fully as well, if not better, than they did last year, when the rainfall was a great deal more. Our dry, late summers are peculiarly favorable to the development of sugar. Many persons erroneously believe that beet sugar is less sweet than cane. The two sugars are, however, chemically identical, and in every respect the same. There is no doubt that with a wise policy of permanent national protection, a great industry can be built up on the Pacific Coast that will give employment, prosperity and wealth to thousands of our citizens. If capital can only be induced to take hold of this enterprise, and a wise protection thrown over it, it will not be long before we shall manufacture all the sugar we consume, then the home competition will cause a reduction in the price. In the meantime wages become high and employment continuous, and every working man becomes a larger purchaser. While this industry is being built up, there will be increasing demand for every possible article produced by this nation. The result will be that instead of benefiting one individual, or only a few, as some contend that protection does, a stimulus will be given to every branch of industry, and our surplus wealth will remain with our own people instead of going into the pockets of sugar producers of foreign countries.

It is said that more happiness is found in pursuit than in possession. This may in some degree account for the tenacity with which the aged prospector clings to his wandering life, instead of settling down, when once he has acquired a competence, as nearly all have done at some time of their life.

THE MESQUITE PLACERS.—Boh Leatherwood intends to return to the Mesquite placers, in Yuma county, as soon as the weather gets cooler. His partner has gone East to get some smaller dry washers made, the one they have being too heavy, requiring the constant services of four men, two at a time. The Mesquite placers, which have been worked on and off for many years, are situated about 50 miles north-east of Yuma. The country is very dry and covered on the surface to a depth of several inches with a deposit of burnt rock or lava, from which the heat steams up in the afternoon like a mist. The thermometer during the day, at this time of year, averages 116 in the shade. The nearest water is at Yuma—50 miles off—whence the party had it shipped by the railroad to Mesquite station, 10 miles from the placers. Water for camp purposes cost the party \$10 a day. The dirt averages \$2 a ton, although far richer dirt has been found here and there in pockets. With lighter machines, Mr. Leatherwood believes the dirt can be worked for \$1 a ton, leaving \$1 a ton profit. During the hot months men cannot work more than five hours a day. At a distance of 20 miles from the placers is the Cargo Muchacho, a very rich and large gold mine, which has recently been bonded by the bonanza firm for \$90,000. At a depth of 80 feet in this mine, an inexhaustible supply of water was struck.—*Tucson Tailings.*

A NEW KIND OF MINING.—Walter Hodgman and Jabez Chase have purchased a two-thirds interest in the Ceresus mine, situated in Croly gulch and are treating the ore as follows: They run their ore through their concentrator, saving the iron, which they sell to the Philadelphia smelter for flux. These concentrates contain eight ounces in silver and one and a half ounces gold per ton. This pays them \$30 and upwards per ton. Two tons of ore from the mine will make one of concentrates. They will mill the tailings, which is the quartz contained in the ore as it comes from the mills. These tailings will ten ounces silver, and one and a half ounces gold per ton. This makes the ore as it comes from the mine worth upwards of \$35 per ton, and as they have quite a large body of ore and can work it cheaply it bids fair to be a very remunerative business. The proprietors of the concentrator at the mouth of Indian creek have shut down the mill for a few days, but will start it up again on Scorpion ore. They have bonded the Scorpion, and will proceed to develop it.—*Idaho News-Miner.*

ALLEN H. CASWELL, who shot and killed himself in this city last week, was a blacksmith by occupation, and a prospector and miner by instinct and preference. He was well known in Virginia City, Bodie, and elsewhere. Some years since he went to Mexico in the employ of an Eastern mining company. The mine proving a failure, he was left stranded in Mazatlan, where he found employment at his trade at large wages, being an expert workman. While so occupied he formed a company of six men, who successfully prospected and opened a silver mine in Sinaloa. Caswell gave up his employment in Mazatlan and joined his partners at the mine, where he worked for a year or more. About three months ago he came to this city to purchase mining machinery for his company. He was well provided with funds on his arrival. His suicide is attributed to despondency, though no special reason is known. He was a remarkably genial and social man, and his suicide is a surprise to his many friends.

MINERS' WAGES.—A report says that last week about forty men went to work in the Holmes mine at Candelaria, at \$3 a day. The next day, however, a meeting was called and they were notified not to work for less than \$3.50. This resulted in closing the mine, which has not yet resumed operations. The men at last accounts were debating the question, but nothing definite is known except that the mine will not be re-opened until the wages are fixed at \$3 a day. If in a country where the ores are of high grade, and when a miner has to huy water by the gallon and live on scorching hot air and fly-blown grub at \$10 per week, they cannot afford to pay \$4 per day for miners, the works ought to be shut down, and stay shut down forever.—*Bodie Free Press.*

SHIPPING ORES TO SALT LAKE.—Gallatin & Folsom, forwarding merchants at Reno, give the *Gazette* the exact figures on a carload of ores which they have had worked at Salt Lake. The ore weighed 19,000 pounds, and assayed \$52.55 per ton. Freight charges amounted to \$138.10, sampling \$29.55, assaying \$6, working at Salt Lake \$175, leaving on the whole carload for the miner at Steamboat \$123.35 for his work. While the cost of shipping ores from Austin to Salt Lake is less by several dollars per ton than from Reno, yet these figures show that a miner can make nothing by shipping low grade ore from Nevada to Mormondom.

The newspaper in a mining camp may have only a small circulation, but its influence does not end with its subscribers. Articles from its columns are copied by the leading papers of the State, and by this means the advantages of the camp and district it represents are brought to the notice of thousands. A due appreciation of these facts would result in a more appreciable patronage of the newspaper by miners and prospectors.—*San Miguel Journal.*

ENGINEERING NOTES.

Decay of an Iron Bridge.

A phenomenon has been observed in the Callowhill street bridge, in Philadelphia, which is of great interest to architects and engineers, although the taxpayers of Philadelphia probably take no satisfaction in it. A few days ago men were sent to repaint the girders of the bridge, and began, as a preliminary process, to scrape off the rust. The attention of the foreman was soon attracted to the unusual size and weight of the scales of rust which fell upon the railroad below, and, on picking some of them up, found that they were solid masses from one-quarter to three-eighths of an inch in thickness. It is needless to say that plate-iron girders which had lost their substance by rust to such an extent as this, would have little strength remaining, and the vibration of the bridge under the movement of a horse-car or loaded cart, which was so great as to compel the painters sitting on their swinging stage to elude to the ropes or the braces of the bridge to avoid being shaken off, indicated still further the necessity for immediate inspection of the whole structure.

The first examination was an informal one, made by persons living in this neighborhood, who found not only that some of the iron work had been nearly eaten through by rust, but that the whole bridge, which is built on a rising grade, had moved downhill so far as to tear out the top courses of the upper abutments, and to buckle the struts of the intermediate supports; while the movements of the roadway framework had cracked the asphalt over them and forced out the paving blocks between the horse railway tracks. The bridge includes one span of 340 feet, and, as there can be no trifling with girders of this length, extensive repairs will probably be necessary. This structure was only completed in 1875, so that ten years of neglect have sufficed to bring it nearly to destruction, and those who have to design important iron roofs or bridges will do well to notice by this example how short is the life of such works if not properly cared for. In the case of the Callowhill street bridge, says the *American Architect*, the corrosion was probably hastened by the action of the smoke from the locomotives which passed under it; but there are hundreds of bridges exposed to the same action, and the iron roofs of railway stations and manufactories are often subjected to similar or more dangerous influences.

Reservoirs on the Upper Mississippi.

A fact of much importance is the announcement made by the government engineers in charge of the reservoir system at the head of the Mississippi. Low waters have always interfered with navigation during the latter part of summer and early fall to such an extent that the carrying of freight to the Northwest by the water route has been tedious and expensive. Some years ago a system of dams to hold water in three different lakes in Minnesota was commenced, and the result has recently been announced. Not only has the usual amount of water been retained in these lakes, but by means of the dams their ordinary depth has been raised in some cases as high as twelve feet, one lake having an area of 90 square miles having been raised that high; another lake having an area of 200 square miles has been raised four feet, and still another lake has been added to materially by the same means. These engineers estimate that by this system they have accumulated an amount of water equal to 24,000,000,000 cubic feet. This they announce is ready and can be thrown into the Mississippi at any time and in such quantities as may be desired. They state that with this amount of water at command they can raise the river from three to five feet, and by that means afford comfortable navigation at all times of the year. If the statement made by the engineers does not fall short of what they claim they can do, this is indeed a valuable work. There is an immense coal trade in the Northwest, which, with good stage of water, might be cheaply brought to market. At present a large share of bituminous coal sold in Minneapolis and St. Paul comes from the mines of central and southern Ohio, being transported to Toledo and Cleveland by rail, thence by lake to Duluth, and from there bailed to the cities named.

THE CANADIAN SHIP RAILWAY.—It is said that the construction of a ship railway to connect the Bay of Fundy with the Gulf of St. Lawrence has been finally decided on. Ships of 1,000 tons and under will thus be able to reach St. John from Montreal, Quebec, and other parts of the St. Lawrence without having to encircle the dangerous Nova Scotia coast, a saving of 600 miles. The ship railway, which is to be seventeen miles long, will, it is expected, be supported by a subsidy of £60,000 per year for twenty years from the Canadian Government.

A NEW SLEEPING CAR.—Railway papers report the introduction of a new sleeping car, of different designs and patents from the Pullman Cars. It is called the Monarch Parlor Sleeping Car, and a company has been organized with a capital of \$5,000,000, which will construct and run cars. They are said to be superior to anything now in use; six cars have already been placed in service.

USEFUL INFORMATION.

Toronto, a New Dye Stuff.

M. Reimann describes in his *Faber Zeitung*, a new coloring material which has been forwarded to him from Lower California. It comes from a shrub, known by the name of "Toronto," upon which the archil lichen (*arilla tinctoria*) is found, and which belongs to the family of papilionacea, with feathery foliage, similar to that of "Robinia" (*Acacia*). The grey colored bark gives a dark brown decoction containing a modification of tannic acid, which is not precipitated by antimony (tartar emetic); but an abundant precipitate is obtained by a solution of glus. The bark is among the Indians used for tanning, giving the leather a handsome red brown color. By the addition of antimony the decoction becomes red brown and darker; it becomes lighter and troubled by hydrochloric, or sulphuric acid. Alumina produces a precipitate of a dark drab color; acetate of iron gives a black precipitate; chromate of potash has no effect upon the decoction. Chromic acid, however, and a mixture of chromate of potash and sulphuric acid, give a dark coloring.

The dyestuff is easy to fix upon cotton, wool, and silk. With alumina mordant it gives a good drab, capable of considerable shading. For cotton, acetate of alumina was used; for wool, alum and tartar, each 3 per cent. of the weight of wool; for silk, simply alum and addition of soap to the dyebath.

Iron gives with the toroto a dark grey color. The cotton was mordanted with copperas and chalk, wool with copperas and tartar, 3 per cent. each of the weight of wool, and this decoction added to this bath. Reimann is of opinion that the material will be valuable, if obtainable at a reasonable price, particularly for black upon cotton and wool, because it gives a very dark grey, which, with a little logwood would probably give a good black. On account of its high percentage of tannin it would be likely to replace nutgalls and myrobolans in dyeing mixed woolsens, particularly such which are fulled, doubles, etc.

OIL FROM SOAPSUDS.—The saving arising from extracting oil from soapsuds is so great that no wool washer ought to allow his suds to run into the sewer in the form they leave the bowls. Tanks are prepared to receive the suds and when a tank is full, a certain quantity of vitriol is poured into it. This causes the suds to curd or crack, and the grease and all solid matters fall to the bottom, leaving the water comparatively clean. The water is then run off down this drain, and the thicker portion at the bottom is afterwards run into a filter bed of sand and gravel, through which the rest of the water gradually filters, leaving the solid and greasy matter behind. This is laid in cloths and called "puddings," which are pressed in hydraulic or steam presses till all the oil is squeezed out. From what is left potash and other ingredients can be extracted, and the refuse used as manure. The oil must be purified, and can be used with great advantage for soap making or lubricating.

PAPER BEDCLOTHES.—A paper-making firm in New Jersey has for sometime been turning out counterpanes and pillow cases of paper. No. 1 Manila paper is used, two large sheets being held together by a slender twine at intervals of three or four inches; the twine is gummed so as to hold the sheets firmly together where it lies. A hem is placed on the counterpane to keep it from tearing; the safety edge is composed of twine. Ornamental designs are stamped in the outer surfaces of the covers and cases, giving them a neat, attractive appearance. When these counterpanes and pillow cases become wrinkled from use they can easily be smoothed out with a hot flatiron. This counterpane can be left on the bed when it is occupied, and in cold weather it will be found a warm covering, paper preventing the escape of heat. The new paper bedclothes are seventy-five cents per set, and will probably become very popular.

WEIGHING A HAIR.—"To number the hairs of your head is not a very difficult task," the refiner of the assay office said. "A very close approximation can be made by weighing the entire amount of hair on a man's head and then weighing a single hair. The weight of the former divided by that of the latter will, of course, give the desired number. If you will pluck out a hair of your beard I can show you." A long and straggly one was accordingly detached, the refiner putting it on a scale, which was enclosed in a glass case, and graduated with extreme accuracy. With little weights of aluminum he piled up one arm until an equilibrium was reached. The hair weighed three milligrammes. "If you reduce this to figures," he said, "it would require 8,000 hairs to weigh an ounce, and supposing you have six ounces, you have 48,000 hairs."

THE LITTLE BLACK SPOTS ON BANANAS.—"Nearly everybody," says the *Chicago Herald*, "thinks the small black spots on bananas the beginning of decay," remarked a South Water-street commission merchant to a *Herald* reporter, "but that is a mistake. Nine out of ten bananas that have these black spots on their skin are sound and wholesome. What

causes the spots? Salt water. Our bananas, you know, come mostly from the West Indies, Southern Mexico and Central America. They are shipped to New Orleans in sailing vessels, and are usually sent on board right from the plantations along the coast. As the vessel cannot reach the shore in many places the fruit is carried out in luggers, and in stormy weather salt water spray gets upon the bananas. Wherever salt water strikes it leaves a black spot."

WHERE ANCHORS ARE MADE.—The stately ships of Bath, Thomaston and other Maine ports all look to a little town on Penobscot bay—Camden—for something they could not well do without, and that is their anchors. More anchors are forged here than at any other place in the United States, strange as it may seem. Many sturdy smiths swing big hammers day after day, summer and winter, in the long, low shops, and big hot forges seeth and blaze, while huge tripammers send music ringing away out over the bay. Hundreds of tons of old iron are bought, the long pieces cut up into short lengths by powerful shears. These small pieces are tied up in bundles, melted and pounded into shafts, flukes, palms or rings by the tripammers, and the various parts are welded into the complete emblem of hope by the forgers. Anchors of from 50,000 to 75,000 pounds weight are made here.

DON'T LICK YOUR STAMPS.—The *London Lancet*, speaking of this practice of licking adhesive stamps and envelopes, says: "This is a perilous practice against which the public needs to be put on its guard. We have seen bad consequences ensue from this habit, which is a very common one. Those who are frequently thus moistening the gum on adhesive surfaces suffer from local irritation, sore tongues and the like, while every now and again we hear of special propagation of disease by the habit. It is very easy to avoid the practice. The danger only needs to be pointed out." Lick the envelope instead of this stamp.

HAY FOR FUEL.—The flour and other mills using steam power in Dakota have substituted hay for fuel, on account of the difficulty in procuring coal. There are coal mines in the Black Hills, but it is expensive, because there are few railroads in the Territory and their freight charges are excessive. The hay gives a good, steady heat, and raises steam very quickly. It is more economical than coal, and the money paid for the hay is distributed among the farmers of the neighborhood.

LAMPBLACK FROM NATURAL GAS.—About seven miles south of Mt. Vernon, Ohio, there has been a lampblack factory for years. The owner began in a small way, and employed the usual mode of manufacture, but has now the largest factory in the world. The black is now made from natural gas, 90,000 jets being in use. The black thus made is of superior quality and commands a high price in the market.

GRINDSTONES.—The use of grindstones by the farmers in the United States is no small item in the trade. Each year they take about 12,000 tons of small grindstones, varying in weight from 40 to 150 pounds besides some 30,000 mounted on frames ready for use. All of the latter are made in Cleveland and Berea, Ohio.

A GOOD COPYING INK is made by dissolving one-half ounce of gum and 20 grains of Spanish liquorice in 13 drachms of water, and adding to it a drachm of lamp-black previously mixed with a teaspoonful of sherry. If the lamp-black is greasy, it should be heated to redness in a covered crucible.

RUG KNITTING has superseded stocking knitting with middle class English old ladies of industrial habits. The rugs are of no particular design, and are called Oriental.

A MACHINE has been invented which wraps up oranges in tissue paper more neatly and rapidly than it can be done by hand.

GOOD HEALTH.

Comfort and Longevity.

Under the above title *Science* publishes the following article, based on a recent German work: Josef Korosi is the director of the Bureau of Statistics in Buda-Pesth, and he has apparently brought to his work a mind well adapted to the difficult task of bandling figures in bulk. This essay which he presents to us under the above title was read in September last before the Association of Hygiene in Berlin, and in it he has confined himself to a few points only. He has endeavored to determine the influence which the varying pecuniary conditions of life, with their attendant privileges and privations, have upon the longevity of the people of his city. For convenience he recognizes four classes, according to their endowment in worldly goods; those who are very rich at one end of the category and those who suffer from abject poverty at the other. Between these extremes lie the great mass of the people, whom he divides into the middle class and the ordinary poor.

He does not claim that his figures possess an absolute mathematical value, because he could not determine the number of living individuals in each category; but by excluding children under five years of age, and taking the average age

of those dying during a period of eight years, he found that:

The rich class averages.....52 years of life.
The middle class averages.....46 years 1.1 months of life.
The poor class averages.....41 years 7 months of life.

From this it is obvious that the possession of wealth, and the resultant exemption from privation, lengthen the average life nearly 10 years.

HOW TO COOL A ROOM IN SUMMER.—The composing room of the New Orleans *Picayune* is situated in the upper story of its publication house, just under the roof, and in summer is extremely hot. An inspiration seemed to have come to one of the oppressed occupants, and in accordance with it a vertical box was constructed in the corner of the room, with openings at the floor and ceiling, and furnished with a pipe for supplying water at the top, and a pan and drain at the bottom for receiving the flow and carrying it safely away. The supply-pipe was bent over the upper end of the shaft, and fitted with a cross like that of a watering-pot, so as to deliver a shower of spray instead of a solid stream. On connecting it with a service pipe the movement of the water was found to cause an active circulation of the air in that part of the room, which was drawn in at the upper opening of the shaft and issued again, cool and fresh at the floor level. The most surprising thing about the experiment seems to have been the effect of the water in cooling the air to a degree much below its temperature. With this Mississippi water, which, when drawn from the service-pipe, indicated a temperature of 84°, the air of the room, at which the thermometer at the beginning of the trial stood at 96°, was cooled in passing through the length of the shaft to 74°, or about 20° below the temperature at which it entered, and 10° below that of the water which was used to cool it.

SURGERY OF DYNAMITE.—The medical faculty have recently given some little attention to what they are pleased to call "Surgery of Dynamite," by which is meant the effect of dynamite explosions upon those in their immediate vicinity. It is interesting to learn from these discussions that the jar or shock which the system receives differs altogether from that which is the result of a blow upon the head or body, or resulting from railway collisions. These latter follow comparatively well-localized and gross form of violence, whereas the shock coming from a dynamite explosion is diffused and divided. In the case of the two young women who were injured by the recent explosions in the Tower of London, neither suffered from contusions, nor did they bear any marks of wounds save a few scratches received from falling upon a pile of rubbish. The sensation they experienced was not that of being violently knocked down but of being "pushed back." Both suffered from severe pain along the right inferior dental and auriculo-temporal nerves, and a profuse catarrh showed the meatus had been injured. Cols, the policeman, suffered from no complication through a fracture of his ribs, but, as in the case of the young women, his chief ailment came from a general enfeebling of nerve function, which caused a depression in the heart's action, and a temporary loss of sight and hearing.

SOUP.—Have soup for dinner by all means. No doubt, in many families, the prejudice against soup has arisen from the fact that it is usually prepared and served in large quantities, instead of, as at the table of the rich, in small portions, though many kinds would furnish in themselves a substantial meal for a growing child. At any rate, the advantages of commencing dinner with soup are manifest in the saving of the meat, bills, and economy practiced in utilizing scraps of all kinds for the making of the soups, and the comfortable sensation experienced after a little has been taken; for, let any person who feels, as the saying goes, "too hungry to eat," swallow a few spoonfuls of soup, and the feeling of exhaustion will soon pass away. Indeed, a well-known authority has said that nothing tends more to restore the tone of the stomach and make easy digestion than a little soup.

HOT WATER FOR SPRAINS.—Many working-men meet with little casualties, sprains being very common. Hot water is the best thing that can be used to heal a sprain or bruise. The wounded part should be placed in water as hot as can be borne for 15 or 20 minutes, and in all ordinary cases this pain will gradually disappear. Hot water applied by means of cloths is a sovereign remedy for neuralgia and pleurisy pains. For burns or scalds apply cloths well saturated with cool alum water, keeping the injured parts covered from the air.

UNDUE PERSPIRATION OF THE HANDS.—A mixture which is said to be a cure for undue perspiration of the hands, is made of a quarter of an ounce of powdered alum, the whites of one egg, and enough bran to make a thick paste. After washing the hands apply this; let it remain on the hands two or three minutes, and then wipe off with a dry, soft towel. Luke-warm water is better than hot or cold, if the skin is tender or inclined to chafe.

THE BLOOD.—There is less blood in cold-blooded than in warm-blooded animals. The larger the animal the greater is the proportion of blood to the body. Man has about a gallon and a half of blood, equal to one-thirteenth of his weight.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WETZLAR.—Amador Ledger, Aug. 15: This quartz mine, situated in Hunt's gulch, just east of the Mammoth, has been worked lately by N. T. Littlefield and George Thomas, Henry Peek representing the former at the mine. One day last week a gold pocket was struck. A couple of candle-boxes of rich ore were brought to Jackson. The extent of the pocket is yet unknown, as since the discovery the men have been employed in laying a track in the tunnel, and will not explore further until this track is completed. We are told that there is a three-foot vein of good looking ore in the face of the tunnel, with 60 tons of milling rock on the dump, which cannot be crushed, however, on account of lack of water to start the Kelly mill near by.

VOLCANO NOTES.—At the Gillick mine, near Volcano, the tunnel is in about 90 feet; the mine shows better than ever. A slab of quartz was shown in Volcano a few days ago literally covered with free gold. Such ore would yield at least \$500 to the ton. Mr. Hoffman, president of the Volcano tunnel Co., while in Volcano last week, located the extension of the Gillick mine, and has men at work prospecting it. The Tellurium has been started up under the management of Captain Roberts. Several men are engaged in clearing the shaft of debris, caused by caving. Lumber is being hauled on the ground preparatory to putting up a building.

MISCELLANEOUS.—The ten-stamp mill of the Mammoth is kept running steadily, with plenty of ore in sight to last for an indefinite period. The Shugert mill is running only at brief intervals, as the water supply will permit. A clean-up has been made, the result of which we are unable to give, beyond that it reached a paying figure. A few men are employed at the mine, but there is no prospect of much being done until the supply of water is sufficient to run the mill steadily to its full capacity. It seems to be generally conceded that this is destined to turn out a permanent paying property. The Carlyle Company, operating the Kittridge claim two miles west of Jackson, have secured the old Martell ditch along Jackson creek, and are cleaning it out for the purpose of carrying water on to the mine. They will use refuse water from the Zeile. A quantity of ore is ready for crushing, and there is a two-stamp mill on the ground, which the owners are anxious to get in motion so as to determine the actual milling quality of the rock.

RICH ROCK.—Amador Sentinel, Aug. 12: At the Shumake mine, Irishtown, a five-foot ledge of very rich rock has been struck. Sinking is still being pushed at the Hadley mine, Volcano. Gold and silver can both be seen in the rock. Sinking on the New York mine will be commenced in a couple of weeks. The determination is expressed to develop this mine in a systematic manner for all its worth. We are informed that the taking of water out of the Kennedy mine will soon be commenced and that it is the intention to this time thoroughly open the mine. This is good news for Jackson, as it will give employment to many more men. Sinking is progressing in the Reed mine at Irishtown with very favorable prospects. A depth of 40 feet has been reached. The mill belonging to the same parties on the Kendall grade is being taken down and put upon the Irishtown property.

Calaveras.

ANGELS CAMP.—Cor. Calaveras Chronicle, Aug. 14: The mines are all giving good satisfaction to the owners, the mills being kept running day and night at their full capacity with good results. They have a large body of good milling ore in the Bechtel and Nevils claim. The lower level of the mine has been run through fifteen feet of good rock and the foot wall has not yet been reached. I am told that it is the intention of the company to erect a new forty stamp mill and use the present one for hoisting purposes. Mr. Lane is about to erect machinery in order to run his mill by steam power when the water fails. A portion of the machinery is now on the ground. The new hoisting works on the Coleman mine are about completed.

CLOSED.—Mountain Echo, Aug. 14: The Cherokee mill has closed down for the present and no work is going on in the mine. It is said, however, that work will be resumed in a short time. Mr. Stevenot is grading and putting in the track and rock platform at his mill near Carson. He expects soon to commence crushing ore from the Santa Cruz mine. He has developed a lead in the mine 4 feet in width which has been thoroughly tested and will yield over twenty dollars per ton. The Santa Cruz bids fair to be a paying mine. The water has been pumped out of the Bechtel mine to the lower level, a depth of about 300 feet, and a crosscut run which developed a solid vein of rich ore over fifteen feet wide. It is the intention of the company to erect a forty-stamp mill on the east side of the hill from where the old mill now stands. A tunnel will be run through the hill, tapping the main shaft below the surface some distance, the object of which is to open a way by which the ore can be transmitted from the mine to the new mill. This mine is rapidly appreciating in value.

Inyo.

DEFIANCE.—Inyo Independent, Aug. 15: During his visit to Darwin a few days ago, Mr. Reddy made a careful examination of the Defiance mine. He is very confident that the future of the mine will be satisfactory. A contract was let last Monday to sink the shaft 50 feet deeper, and work is already begun. The shaft for a depth of 105 feet is all in one, and the additional depth is expected to continue in ore that will contain 37 per cent lead and the usual amount of silver. At the bottom of the shaft neither wall of the ledge appears at a width of 10 feet. In that district valuable ore bodies have always been found in large deposits, and everything now indicates that one of these big bodies has been found in the Defiance. Mr. Reddy believes the ore is there, and will work to find it.

CASEY MINE.—The owners of the Casey mine, four miles above Bishop Station, are now making experiments that will determine what shall be done with the mine in future. A great deal of exploration has been done, and there is much ore in sight and

the experiments being tried are to determine the value of the ore, and the process by which it must be worked. One vein of ore, in the mine is 16 feet wide, another is four feet and there are several smaller veins. The two large veins are low grade ore; the smaller veins are very rich, some of the ore running away up in the thousands of dollars per ton. If the experiments shall prove satisfactory it is understood that a mill will be built immediately.

FOUND.—For six years past Neal S. Thompson has been working to develop a mine at Darwin. A tunnel run by him 150 feet has struck a vein of ore three feet wide. A drift has already been run on the vein 40 feet, and it continues uniform in size and character that distance; the vein in the face of the drift is as good as any passed through. The indications all favor the expectation that the ledge will get wider as it goes down. Good judges are confident that Mr. Thompson has enough in sight to pay him fairly for his six years' work. The ore is of the average quality found at Darwin.

MINETTA.—The Minetta mine at White Hill has been leased to Billy Hedge. Recently the mine has been showing up in a most encouraging way; in that and the adjoining claim of Downs and Welch the ledge has been explored the entire length of both claims, 3,000 feet, and good ore found all the way. Billy is one of the locators of the Minetta; the other two locators are otherwise engaged, and have leased to him their interest in the claim; he will at once proceed to work the mine, and has a very good prospect.

CERRO GORDO.—From their leased ground in the Union mine, Locket, Casey and Basto this week made a shipment of 20 tons of ore. They intend to have about 20 men at work in the mine about the beginning of next month. From the same mine T. C. Boland has shipped about 60 tons of ore the present week.

DARWIN.—Frank Silva recently made a shipment of ore from Darwin to San Francisco. The exact quantity shipped has not been reported, but the more important fact is certain that the ore paid very well. The following are the returns: Silver, 8½ ounces per ton, gold, \$9.04 per ton; lead, 50 per cent. From Pine mountain at the end of last week, S. P. Roberts shipped a carload of ore to San Francisco.

Mariposa.

NEW MINING ENTERPRISE.—Herald, Aug. 14: Messrs. Rogers & Bates have sold the Francis mine on Mariposa creek to A. E. Chodko, formerly superintendent of the Quartz Mining Company in Fresno county, and work will be started up right away. John Mitchell, Joe Spagnoli, and Fred Schilling have come over from Quartz mountain and are now engaged in moving the boiler and engine and ten stamps from the old Washington mine over to the Francis mine. One load of material has already been hauled over. The company intend building a road to the Bridgeport road. We understand that the underground operations in the mine will be under the able management of John Mitchell, who is well known in this county as an experienced miner.

Mono.

STANDARD CON.—Bodie Free Press, Aug. 7: The 300-level north drift advanced 18 feet. The ore bodies continue to average well, with indication of further improvement on the 400-level. Prospecting in various parts of the mine is being steadily continued. Total number employed, 67. Ore sent to mill, 441 tons, with six days' run of tramway. Mill running steadily.

BODIE CON.—East drift from north drift between 300 and 400-levels is in 25 feet. South drift from joint east crosscut 400 (Mono) level is in 18 feet. Twenty-five men employed.

MONO.—Winze No. 2, 550 (Lent shaft) level 400 feet from the Bodie line is down 70 feet. South drift on same level is in 31 feet. South drift from joint east crosscut 400 (Mono) level is in 18 feet. Seven men employed.

THE BODIE TUNNEL.—On Saturday last all work was stopped in the Bodie tunnel. Superintendent Colcord had so economized and systematized the work that a force of only thirty men was required to run the mine and mill, but it appears that the ores of the ledge on the 400-level will not so far as at present exploited pay a profit on extracting and milling. Doubtless chimneys of pay ore can be found should the company elect to prospect for them, more especially in the upraise from the 200-level. This may be decided upon, but hardly at present. The principal stockholder is Robert Sherwood, of San Francisco, with whom rests the matter; as also whether the tendered resignation of Superintendent Colcord will be accepted. The mill is running to clear the dumps and make a thorough clean-up. Of course the knocking off from work of about thirty men will be noticeable in town along about pay-days, but among outside investors it will not affect the value of Bodie properties generally.

Nevada.

EUREKA TOWNSHIP.—Nevada Transcript, Aug. 15: One of the most prominent and interesting mining properties in the close vicinity of Graniteville, is an extensive drift mine known as Chaparral Hill. This is an ancient river channel, covered many feet in depth with an overflow of lava. Several small tunnels have been run in a short distance and encouraging prospects found. Some of the owners not having capital to push the work, it is at present lying idle. The owners are J. T. Cline, Cruse and Euler, and the ground is covered by a U. S. patent. Passing the Mohawk and some smaller mines virtually abandoned we come to the Sweet mine. A small amount of work was done on this mine some twenty years ago and it paid immensely. Through mismanagement and litigation the capital was squandered and it has laid idle about ever since. It is patented. Thence south-east about a hundred rods is the Iowa. This mine paid well to water level, yielding \$40 per ton, the ledge holding out well to the bottom of the tunnel and offering a good chance to find a valuable mine. Adjoining this comes the Birchville mining property with improvements consisting of a five-stamp steam mill and steam hoisting and pumping machinery. The owners of this property (Maybanks and Parsons) not having the capital to develop it, offer liberal inducements to capital. The Commercial, a contiguous ledge owned by the same parties, has a tunnel in 400 feet on the line of the ledge which is well defined. There is 80 tons of rock on the dump, showing fine gold and an abundance of sulphurets.

Southeast a quarter of a mile is the Mulligan ledge, undoubtedly a valuable mining property. It has no improvements. The owner is Patrick Mulligan. Leaving to the south-east the Jim, the old California, Baltic, Star, Norway, Centennial, Golden Fountain and others, we next come to the New California which is a fair example of what persistent effort will accomplish. This mine has lain idle many years and like many others was supposed to be "worked out" when really the owners or managers were "worked out." Mr. Bobbannan, merchant of Graniteville and owner, offered liberal inducements to Messrs. Millerick, Foley and Haddock to prospect a little, which they did with a good will. Their labors after a few months have been crowned by a rich reward, they having brought down recently, after a short run, about as much clean gold as a man would want to carry. A fine ten-stamp mill is on the mine. The Erie and the Ancho mines (patented) are idle. So is the Amazon. Mr. Shepp is working his mine, taking out rock that pays \$35 a ton. This I know, having milled the rock for him. This also is one of the "worked out" mines. The Old Rocky Glen, owned by John Hippert, will make these mountains echo with the music of a large stamp mill. This mine has already given to commerce \$400,000 in gold. It is now being prospected by capitalists from San Francisco. The Eureka Lake, North Bloomfield, Milton and Miners Ditches can supply water power to run 100 mills, and return the water to follow on down the Ridge to work the other mines. We have plenty of timber, good sawmill, daily mail and express, a commodious first class hotel and lively stable, accommodating stage line from Nevada City daily. There is no more inviting field for the prospector, the tourist, the invalid and the lover of the beautiful.

THE MARYLAND MINE.—Foothill Tidings, Aug. 12: The contractors at the Maryland mine are doing good work, having the shaft down now about 300 feet. The appearances are very favorable, every indication going to show that the main ledge is but a short distance away. Everything at the present depth has the same appearance as did the famous Idaho when that mine was but 300 feet deep. There is but a very little water to handle in the Maryland, the present machinery being ample to sink to a good depth yet. From the way work is progressing it is thought that the ledge will be reached in a little while. The Maryland adjoins the Idaho on the east.

CONSTITUTION MINE.—Transcript, Aug. 12: Mr. Roberts, who recently bonded the Constitution mine, in Willow valley, from Maltman & Myers, is finding some good ore. Water for running the hoisting and pumping works is obtained from the Snow Mountain ditch, from which a fall of 240 feet is had. Only about six inches of water is used, making the expense of motive power for the machinery but \$1.20 a day.

Siskiyou.

ARASTRA.—Yreka Union, Aug. 13: Messrs. Kilmer & Shaw, on Methodist creek, in this county, have just completed a large arastra, and anticipate reaping a golden harvest from their mine. Messrs. White & Clark have about completed another arastra and expect good returns for their work. Lieutenant Governor Daggett, at Black Bear, has struck some very good quartz, both at the Yellow Jacket and the B. B. The ledges are from three to four feet wide. The mill will be started up by steam as soon as some little repairs are made in the chutes and dumps.

Shasta.

ANOTHER BIG STRIKE.—Butte Record, Aug. 12: From a gentleman who came down from Shasta yesterday, we are informed that a gold bearing quartz ledge has recently been discovered on Hazel creek, about twenty miles north of Delta, that excels in richness anything heretofore found in California or Nevada. Two old miners who have been working in the Comstock mines about nineteen years, went to Shasta county a few weeks ago to prospect for quartz mines. A few days ago they made this discovery, and they immediately telegraphed to their partner in Nevada to come at once, as they had discovered and located a ledge of black quartz, 100 feet wide. They sunk down on it and took out some rock and sent it to San Francisco. It was assayed and yielded \$1,760 to the ton. It is black quartz, and exactly like the rock taken out of the Shearer & Rattler mine near Redding.

A NEW STRIKE.—J. C. Hoar and Thos. Koons, two Arizona miners, recently made a rich strike in the Old Diggins district. The ore at thirty feet in depth resembles the tellurium on Salt creek and assays up in the hundreds. The lucky finders believe it is the mother lode of this country, basing their belief upon the formation, strength and course. It runs in a northeasterly and southwesterly direction.

FRENCH GULCH.—Shasta County Democrat, Aug. 12: Tom Green, of French Gulch, was in town Monday, feeling poorly in health. He says that he will clean up a few thousand out of his mine this summer for the rainy days. Tom deserves it all. In the event that the new owners in the Lost Confidence mine build a road to Copley that place will immediately become a live camp. Already we hear of parties preparing to start in business there. Three prospectors lately struck a rich quartz prospect on Breslau's land. About a mile west of town Geo. Bassett and N. Slater are sinking on a well-defined vein of blue, heavily sulphuretted quartz, greatly resembling Schearbr's tellurium, which we are told assays up in the hundreds. Budd Crume and a couple of prospectors have struck a rich find on Middle creek about 100 yards above the bridge. It is said to be tellurium. A couple of San Francisco men were so struck with the find that they jumped it at a livelier rate than they jumped on. It certainly has the outlook of making a fine mine. Hon. Rueben Clark, of Colusa, arrived here last Thursday with the first shipment of his quartz mill machinery, and has been hard at work since putting the apparatus in place on the mine he lately purchased of Tom Harrison. All the machinery has now arrived, which consists of a Dow steam pump, portable 18 horse-power engine, and a ten-stamp mill of the Hammond pattern. There are quite a number of Arizona miners in the county, and last week several arrived from Calico district, San Bernardino county. They gave it as their opinion that we have the best mining field they have found on the coast. In fact, they are bewildered with the surface evidence of so much precious minerals, and naturally they write their conclusions to their friends.

One gentleman who has been here for about three weeks and seen much of our county, tells us that before winter sets in fully 500 miners will come here from Calico district alone.

Sierra.

A BIG CLEAN-UP AT FOREST CITY.—Sierra Tribune, Aug. 16: The regular weekly clean-up of the Bald Mountain Extension Company, at Forest City, Sunday, amounted to one hundred and forty seven ounces of gold. The company is still working wholly in the South Fork ground, but they expect to get through on their own ground inside of a couple of weeks.

Tuolumne.

LOOKING WELL.—Tuolumne Independent, Aug. 15: The Nery mine at Italian Bar, continues to look well. The mill is being refitted, and a handsome clean-up will be made after the next run. The mill, at Summit Pass, keeps pounding away, night and day, yielding the owners good returns. A short time ago the Richards boys struck a \$200 chispa, in the Joint Stock Gravel mine, near Springfield. Work in the General Hatch's mine, in Table Mountain, is being rapidly pushed forward. Mr. McTarnahan, the superintendent, is the right man in the right place.

Trinity.

BULLYCHOOP.—Journal, Aug. 14: From this flourishing quartz mining camp we learn that Messrs. Titus and Grant have struck the ledge in the Central mine, five feet in width and it will average \$20 rock. Part of their Huntington Mill has arrived at the end of the wagon-road and a sled-road is being built that it may be taken to their mill-site. Davis Bros. have struck the lode in their tunnel on the Pound Cake mine and it looks remarkably well. The Hoskins Bros. continue to strike good ore from the Little Gem. Bullychoop is just now getting into shape to show what it really is.

NEW RIVER.—Yreka Union, Aug. 13: An esteemed friend at Black Bear sends the following interesting mining news: "Mr. Clemmens and another gentleman from New River stopped at this place over Sunday night. They report the mines looking considerably better than a short time ago. They counted the names on the payroll Saturday evening, and report 170 men in and around the camp, all of whom are busy at work. Messrs. Clemmens & Ladd are about to sell out the Ridgeway and Hard Tack mines to a company of twenty men at Eureka for sixty thousand dollars. Mr. Clemmens says that he has every reason to believe that the sale will take place."

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, Aug. 15: The deep winze below the 3,000 level was down 150 feet last evening, well timbered throughout, and its bottom or face still in the ore vein, which has stayed with it continuously thus far. The ore is somewhat inclined to be in bunches, showing best on the east side, and giving good assays. Eighteen feet further will carry it to the 3,100 level, making a distance of 127 feet, following the dip or incline, or the length to the winze from the 3,000 to the 3,100 level. No water has been thus far encountered. At the 3,100 level a station is to be opened for a drift, to connect with the Combination shaft. This drift or crosscut will be run in a southeasterly direction, as the winze lies about northwest from the shaft. Necessarily, it will have to cut through the ore vein, which is considered to lie east of the winze, and will be a very important drift in that connection. In fact, should the anticipated good ore body be met with at that point, extraction and milling would naturally follow, constituting that as the 3,100 level of the mine. The north lateral drift from crosscut No. 2, on the 3,000 level has been stopped, it not being deemed advisable to run any risk of tapping water in that direction just at present, or until the new pump is fully and practically at work, ready to receive all the water that may be found in any direction.

THE GOLD HILL GROUP.—The main incline of the Imperial mine is being repaired above the 1,500 level, where a cave occurred recently. It connects with the 1,300 level of the Yellow Jacket and is needed as an airway for ventilation purposes in the ore producing sections of that mine. The Kentucky mine is yielding forty-five or fifty tons of ore per day at present, which is hauled by teams to the Rock Point mill on the Carson river for reduction. The Crown Point and Belcher mines are doing nothing beyond a little prospecting at present, but when milling facilities shall allow of ore production being resumed, something pretty good may be looked for in the way of ore development on the 1,700 level of Belcher, a point we have alluded to occasionally heretofore.

CHOLLAR.—All operations in this mine continue in suspense, pending the completion of the hydraulic pump in the Combination shaft. The new section is all in place, the connections were being made last evening, and the whole is expected to be completed to-day, ready to start into practical operation tomorrow, or on Monday at the furthest. The first of next week, or as soon as the hydraulic pump is all right, the station will be opened from the 3,100 level of the Combination shaft to run to connect with the deep winze of the Hale and Norcross at that level. This drift will run northwest toward the winze to connect with the drift to be run from it. The total distance will be about 180 feet, and it will take five or six weeks.

SIERRA NEVADA.—On the 520 level the main lateral drift northward, or rather to the northwest, after skirting along and into the eastern borders of the ore vein for a distance of 1,001 feet, twelve feet of which was made during the past week, is stopped, and a crosscut west at that point, 1,000 feet north of the shaft, has been started. This is now in 43 feet, with its face in vein matter. It is a very important drift, and will be continued through to the west wall, which may be 500 or 1,000 feet distant, as the main Comstock ore vein in Cedar Hill is of great and practically undefined width.

BEST AND BELCHER.—West crosscut No. 1 on the 1,000 level, near the Consolidated Virginia line, has been extended 35 feet, making a total of 391 feet, and stopped, further progress in that direction not being deemed advisable at present, no favorable indications being met with. A crosscut, designated as No. 2, west, has been started 100 feet south of it. It is now in about ten feet, and making good progress in favorable working ground.

COS. CALIFORNIA AND VIRGINIA.—The daily shipments of ore from this mine are about 170 tons, which come from the 1,750 level, worked on company account, and from the Jones lease section above the 1,550 level, the latter section furnishing about one-third of the ore taken from the mine. The old Consolidated Virginia shaft is being repaired between the 1,200 and 1,400 levels, and is to be used for ore hoisting purposes shortly, or as soon as in proper order.

ALTA.—Owing to the heat and lack of ventilation, work has been discontinued in the upraise above the 600 level, and a drift west is started from the main north lateral drift on the 700 level. This cross-drift is now in 43 feet, running in firm blasting rock, and has about 450 feet to go in order to reach the ore prospects developed in the upraise above the 900 level.

OVERMAN.—Still exploring on and above the 225 level. No high grade ore bodies are met with, but a small force of men is kept at work, following up the best indications and taking out a little fair grade ore which is saved for milling.

GOULD AND CURRY.—On the 1,000 level, west cross-cut No. 1, near the Savage line, has been extended 100 feet; total length 152 feet. The face is in favorable working ground, with nothing of interest to note.

BILLION.—Some very good looking streaks of vein matter, strongly mineralized, have been encountered during the past week, indicating closer proximity to the anticipated ore deposit.

MONTICELLO.—The new shaft is now down 67 feet, well and substantially timbered throughout, and the gallow frame is in place, also the steam engine to do the hoisting.

Cortez District.

LIVELY CAMP.—A note from Cortez to the *Silver State* says times are quite lively there. The mines are looking well, and S. Wenham is budding new reduction works.

Columbus District.

LANDLARI.—Inyo county *Reporter*, Aug. 13: The trouble at Landlari is on account of the reduction of miners' wages from \$1 to \$3 a day. Miners (all that can get away) are leaving daily. It is thought by some that after the old hands have left, a new set of miners will be put on, which may come about in a month or six weeks. Mr. Shoenck, superintendent of the Monte Diablo, is now in San Francisco in the interest of the company. We are assured that the mines are looking better than ever before. The lower mill at Belleville is working on Victor ore; after its reduction, it is presumed the mine will close down temporarily for the reduction of wages, as in the others. It is pleasing to know that it is not because the mines have petered out that the camp is prostrated, a condition due alone to the wages question. It is yet, but for that, the banner mining camp in the State. The weather is said to be very hot; this week the thermometer got up to 105° there in the shade.

Como District.

A COMO MINE.—Dayton *Times*, Aug. 8: The North Rapid mine, at Como, in which Senator Westfield, George W. Keith, William Maxwell and others are interested, is looking very well. Rock is being taken out, and a shipment of thirty or forty tons will be made to the Rock Point mill at this place some time next week, it is thought. Assays made from some of the rock are very encouraging to the owners as well as those who were beginning to lose faith in the camp.

Central District.

AT WORK.—*Silver State*, Aug. 16: S. W. Hammond, of Central district is in town. He says several prospectors are at work in the district. He has been developing the Mollie lead, recently discovered by him, and has taken out about 25 tons of ore, which assays well in silver and carries about 33 per cent of lead. Frank Clark's mill, on the Humboldt, is running steadily on ore from Central and Dun Glen, and is doing good work. It is a five-stamp mill run by water power.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Aug. 15: Notwithstanding many of the miners throughout the district are holding back considerable ore in anticipation of better prices, the shipments to the two furnaces in town during the past week have been very good. To the Richmond furnaces the Dead Broke sent down 6 tons; the Silver Lick, 9 tons; Silver Connor, 58; Lord Byron, 7; Home Ticket, 6; Enterprise, 4, and the Prospect Mountain Tunnel, 1½. The Irish Imbassador and Excelsior mines also made shipments. To the same furnaces there was brought in from the 1 into some ten tons, and from the Uncle Sam at Newark 2 tons. Five tons of very rich ore were shipped in from Northumberland near Belmont. To the Eureka Con. furnace the Dead Broke mine on Prospect mountain shipped 15 tons, and the Jackson mine on Ruby hill sent down 23½ tons. The following named mines in Revereille District, Nye county, sent in ore to the same furnace during the week: The Fisherman, Ohio, Perseco, Osecola and Liard.

A BETTER OUTLOOK.—The *Sentinel* is reliably informed that the Eureka Con. Company will at once commence excavating for the construction of another furnace alongside of the one now in successful operation. The furnace will be almost a facsimile of the present one, and will have the same working capacity. We are also informed that it is more possible now than it has been in many months that a mutual arrangement will soon be arrived at by the company named and the Richmond people for the starting up of the former's large pumps and draining the lower levels of the two mines. If this is done, a better future is certainly ahead for Eureka, as it appears to be a foregone conclusion among practical and scientific mining men who have visited these properties that larger and richer ore bodies will be found in the lower levels than have ever been found in the upper. We trust our information will prove correct, and that good work will commence at a very early day. The Eureka Con. mine is looking and yielding well, especially the Williams ore body on the seventh level, which has produced many hundred tons, and which is evidently capable yet of producing many thousands. Altogether, the outlook is good.

Emeralda District.

AURORA.—Walker Lake *Bulletin*, Aug. 12: It has been understood for some time that the sale of the Humboldt mines, at Aurora, was finished, but

owing to the delays necessarily incident to large transactions of that nature, work has not yet been begun. Arrangements are, however, being made for a complete remodeling of the mill. Instead of 20 stamps, as at present, 30 will be worked. All the old machinery will be replaced by new and an entire change will be made in the general plan of mechanical work. It is not likely that anything will be done until some time in September, but work on a large scale will, without doubt, be carried on before the end of this year.

Frleberg District.

EXAMINING A MINE.—*Eureka Sentinel*, Aug. 14: Hink Donnelly and Con Riley are expected daily to arrive from San Francisco. While below recently P. N. Hansen arranged with them to come up and go with him to look at Joe Williams' mine in Frleberg district, about 100 miles south of Eureka. The mine is said to be a very promising property. If it suits them the parties named will organize a syndicate to purchase it. The mine carries smelting ore in large quantities. There was considerable work done on the Frleberg mines in about the year 1872. Judge Goodwin, now of the Salt Lake *Tribune*, commenced the construction of a furnace there, built roads and did much outside work, but had to abandon the enterprise for the lack of capital. Most of those who had mines there left at about the same time. J. T. Williams, of Hot Creek, and the Ernst brothers, however, have been doing something at intervals on their mines down to the present time. They now have their property pretty well developed and it makes a very fine showing. There is a strong probability that the proposed visit will lead to a sale. Mr. Hansen only awaits the coming of the San Francisco parties. They will go by the way of Hot Creek and expect to remain a week at the mines.

Lewis District.

HUNTINGTON MILLS.—*Central Nevada*, Aug. 8: The Pittsburg Consolidated is running two Huntington mills steadily on fair ore. The shipments of gold bars during the month of July amounted to more than \$6,000 with only one mill running. Now the bullion yield will be doubled, for although they are only working a few men in the mines, they are piling up the ore pretty lively. The Pittsburg is a wonderful mine, and has paid well from the start. The Morning Star, run by Bothwell & Morgan, is being pumped out from the timbering shaft, preparatory to starting the mill, which, when running, will add considerably to the bullion production of Pittsburg.

Ophir District.

MAY RESUME.—*Belmont Courier*, Aug. 8: Active operations may soon be expected to be resumed in the mines of Ophir canyon. The ores are of a high grade, and have always left a handsome profit after paying all working expenses. Properly handled, Ophir ought to be with its mines, one of the most permanent and best camps in the State.

Reese River District.

MANHATTAN.—*Cor. Central Nevada*, Aug. 8: The present management of this vast property is entitled to great credit for the manner in which they have handled the mines. Coming into possession of what was formerly the Oregon Mill and Mining Company's property, and organizing what is now the Manhattan Company, with Allen A. Curtis at its head, they have carefully developed mines that could never have been worked but for the business tact of Mr. Curtis and those whom his foresight has called around him. John Frost, who located the first mine ever discovered in Austin, and who worked the whole property on the hill as general manager, under the supervision of Allen A. Curtis up to 1877, when the present managing superintendent, Captain Melville Curtis, took charge, is now the general manager of all the machinery of the company, both on the surface and underground, and the labor-saving improvements which he has put in operation, with the aid of Mr. Johnson, foreman of the machine shops, would surprise some of the old Constockers who pride themselves on their ability in this direction. The whole property is managed with but little friction. Captain Melville Curtis, as general superintendent, looks after this vast property with a graceful ease that proves him the right man in the right place.

Rebel Creek District.

WILLOW CREEK MINES.—*Silver State*, Aug. 15: The Wild Deer mine, at Willow Creek, owned by McColely and McEran, bids fair to be one of the best properties in Northern Nevada. It is prospected by shafts and tunnels to a considerable depth, and the lead is strong and carries rich ore in the lower works. From one-fourth to one-third of the assay value of the ore is gold and the balance silver, and it is remarkably free from base metals. Occasionally streaks of very rich ore are found in the lead, specimens of which assay as high as \$2,100 in gold and \$9,500 in silver to the ton, but the average battery assay is about \$80 to the ton. The owners of the Wild Deer had to encounter the usual difficulties of opening mines experienced by men of limited means. Considerable work had to be done and much money expended before anything was realized from the ore, and were it not for the energy and perseverance of H. H. McColely, the Wild Deer, instead of being valuable property to-day, would be nothing but a prospect. As it is, considerable money has to be expended in building a road from the mine to the mill, and in opening tunnels to the lead to save the expense of hoisting ore through a shaft, but as the lead has every indication of permanency and the ore is rich, the owners are warranted in making the outlay, as it will reduce expenses materially. The Willow Creek mines, as they are usually called, are in Rebel Creek district, and were first brought into prominence by the discovery of the Ohio lead. This was purchased by J. J. O'Toole, of Salt Lake City, a mining man of much experience, and it is now owned by the Ohio M. & M. Co. The rich ore extracted in opening up this mine is shipped to Salt Lake City for reduction, and the proceeds are said to be sufficient to pay all expenses. The second-class ore is piled on the dump, to be worked when the company build a mill, as they contemplate doing shortly. The custom in many parts of Nevada has been to build a mill first and find a mine afterwards, but the Ohio company is not conducting business by this rule, as they are developing their mine before they build a mill. There are numerous mining locations in Rebel Creek district, many of which show rich croppings, but like the Wild Deer, it requires considerable capital to develop them, and as that is a thing which their own-

ers lack, the mines are undeveloped and will be until capital is attracted to the district.

ARIZONA.

CATARACT CREEK MINES.—*Prescott Courier*, Aug. 14: The Ash Fork correspondent of the *Flagstaff Champion*, gives the following information concerning the above-named mines, situated in the northern part of this county. Messrs. Sullivan and Humphrey came in from their mines in Cataract Canyon, Monday, and report their property as looking well. They brought in a few specimens of a recent strike made in their property that beats anything yet discovered in the whole Cataract district. It is a hard, gray carbonate ore, containing fully eighty per cent of lead, and when a piece of it is freshly broken its surface shows up completely covered with small particles of horn silver and scales of chlorides, which fully demonstrates the fact that the ore is extensively rich. Mr. Sullivan says that they will soon have a large force of miners at work breaking down ore, for shipment to San Francisco. The Stone Consolidated Mining Company's property lies just above the Grand Canyon of the Colorado. They have several men at work developing the immense ore bodies and already have several tons of rich ore on the dump ready for shipment. The Sherman Company, of Sacramento, California, are pushing developments upon the Hidden Treasure. They have a tunnel in about seventy-two feet and it has been in a solid breast of ore from the starting and it is their boast that there has never been one wheelbarrow full of waste rock since the commencement. Their whole dump is one glittering pile of rich ore. The different companies operating in the district have each put an equal number of men at work in Beaver Canyon, constructing a wagon road into the Cataract. When completed burro trains will be dispatched with, and as there are quite a number of them, it will in consequence throw a large number of packers out of employment, and burros will be cheap.

MORE RICH ORE.—*Prescott Courier*, Aug. 17: News of another rich find in Turkey Creek district was brought here yesterday. It is a large deposit of rich horn silver ore, near the Pine Spring mine. Men are sacking the ore. A great many locations have been made, and there is a stampede to the place.

STERLING.—*Prescott Courier*, Aug. 14: The Sterling mill, which consists of an engine, ten stamps, pans, etc., and four concentrators, will shortly make its trial run on ore from the Sterling mine. The mine is situated in the mountains, about five miles south of Prescott. The mill is on Groom creek, a little further south. Both properties belong to the Rescued Mining Company, of which P. A. Cruique and Townsend Cox, Jr., are the resident officials. Mr. Francis, an old and well known Nevada miner, is foreman at the mine. He it was who made the Desoris mine a great bullion producer. W. T. Brown has superintended the erection of the mill and machinery. Ed Morey will act as millman. Our people look to the Sterling mine and mill for good results. The mine is pretty well prospected. It produces gold bearing sulphurets in great quantity. Success at the Sterling will mean successes in many other places in this part of Arizona.

FLORENCE FACTS.—*Enterprise*, Aug. 8: The Bonanza firm sent their expert down to examine the Keymer mine. His report was favorable and the company offered \$150,000 cash for the property, but the owner would not sell. Five or six bars of bullion from Globe passed through here this week. That camp is improving. The hills surrounding it are full of chlorides, who are having their ore converted into bullion at the various mills in that district. The Old Dominion is expected to start up soon, and that will lend additional life and furnish a large amount of business to the camp. The owners of the Mammoth mine and mill find that their ore is rebellious, and they are now having it thoroughly tested to ascertain what change will be required in their machinery to insure success in extracting the gold. It carries about 20 per cent lead, we understand. Their ore bodies are large and average about \$15 per ton gold. If it can be successfully treated it will pay handsomely.

COLORADO.

ORE.—*San Miguel Journal*, Aug. 15: During the past week no changes worthy of note have occurred in the mining industry about Telluride. All the leading mines are adding to their forces, and ore is being taken out faster than it can be disposed of. The Pandora, Nellie and Gold King mills are running to their utmost capacity and the Wann mill opposite town will soon start up also, having ore enough ahead to last three months. Contracts are being let on new properties, and though we shall not from week to week dish up a constant rehash of mining items that have been stereotyped since the discovery of the San Juan, yet we assure our readers that never in the history of Telluride has general business been better; our mines are in excellent condition, and everything indicates for Telluride one of the most prosperous seasons by far, that any San Juan camp has ever known.

THE WANN CONCENTRATOR TO START UP AT ONCE.—The difficulties among the owners of the Wann concentrator have at last been adjusted and the mill will start up at once, and will be run night and day from now on. Mr. Wann has secured a contract of 2,000 tons from the Sheridan, and will also treat the entire output of the Smuggler and Mendota. He will put in three extra vanners and will give employment to 300 more burros than are now at work in the camp.

IDAHO.

FROM LAVA DISTRICT.—*Keystone*, Aug. 12: Jerome F. Jacobs returned from a visit to the town of Lava, Lava district, Thursday, riding over a distance of seventy-seven miles from four o'clock in the morning to six in the evening, horseback. Jerome says every indication points to its being a good camp in the near future. He visited the Martin mine and reports it the biggest mine in the country. However, Mr. Martin had bonded the mine to Salt Lake parties for \$55,000 and they were to have taken the mine yesterday. It has been reported frequently that Martin has refused \$150,000 and \$250,000, etc., but Jerome informs us that he saw the bond and it was

for just \$55,000—no more or no less. The receipt of the news of the decision of the Salt Lake parties to take the mine caused lots in the town of Lava to advance from 100 to 200 per cent in price. It is the intention of the purchasers to put up large mills and work the mine for all it is worth. There are many other good prospects in the vicinity but nothing has been done in the way of development—all waiting for the new mill to be built so that ores can be worked at home. There is estimated to be \$100,000 in sight on the surface, in the Martin mine alone. Lava will undoubtedly be a good lively camp in the near future. The town of Lava is located at the mouth of a shallow canyon, eighteen miles from Arco station on the Challis and Blackfoot road, twenty-two miles from Houston, and one mile from the Martin mine. There are nine business houses in the town, and buildings in the course of construction for the same purposes. Five miles from Lava is Antelope district. San Francisco parties are looking out a site in Antelope district to put up a mill. The ore in that section is principally milling, but some small lots of lead ores have been found.

SMOKEY ORE.—*Wood River Times*, Aug. 14: The first lot of ore brought to Hailey over the new Smoky road has just been sampled. It consists of 25,000 pounds, of which 15,000 was first-class ore, carrying 123 ounces silver per ton. This lot comes from McClintock's King of the West. The Galore and other claims have ore ready to ship, but none in here. The Alma will make its first shipment about the end of this month.

THE HORN SILVER MINE.—A letter received here yesterday states that the Horn Silver mine, Lava district, better known as Martin's was positively sold, last Saturday, to the Salt Lake parties who have been examining it. The new owners were to take charge this morning, with the intention of working the property for all it is worth. The price paid is stated to be \$275,000. This sale will have a very beneficial effect, as it is the result of a critical examination by competent experts, and will draw the attention of capitalists to this new portion of Altnas county.

PHILADELPHIA SMELTERS.—*Ketchum Keystone*, Aug. 14: The Philadelphia smelters have been nicely cleaned up and put in excellent trim for the resumption of work in a few days. A long and prosperous run is again foreshadowed from the fact that ores, fluxing material, etc., are accumulating at the works in great quantities. Five cars of iron ore and two of coke, aggregating one hundred tons, were received Monday alone, and the ore receipts for a week past have averaged fifty tons per day, with much larger averages promised for the immediate future. The last run of the two fifty-ton stacks was one of eight weeks continuous, and then only shut off by failure of the bosses to supply fluxing iron contracted for. But the compulsory blowing out has enabled the management to clean up as stated, and the run about to commence will no doubt last all fall, while there is every probability of operations continuing right along through the winter. A drive of three thousand cords of wood is now in the river at the smelting grounds in charge of F. R. Gooding, charcoal contractor, and with a full supply of all material there is no reason why these smelters may not operate all winter. Their water power never fails as the warm springs are turned into the ditch as soon as cold weather sets in, which prevents freezing in the most severe cold spells. They ran up to February for the past two winters without trouble or inconvenience—until the ore supply gave out. With the present and promised augmented production we believe the continuous run of the smelters through the year is now assured. And the future of our town most promising in consequence.

MONTANA.

A 125-TON CONCENTRATOR TO BE ERECTED.—*Inter-Mountain*, Aug. 12: From Mr. Lee W. Foster, one of the owners of the Liquidator copper mine, it is learned that a concentrator having a capacity of 125 tons per day is to be erected on that very productive property. The machinery was telegraphed for yesterday, and excavating for the building commenced this morning on Silver Bow creek, near the Clark works. Concerning the capacity of the Liquidator to supply 125 tons of ore per day there can be no doubt. The property is well developed by a shaft 300 feet deep and crosscuts show the ledge to be forty feet between walls. All last year the output averaged 100 tons per day. The first and second class product was sold under contract to the Montana Copper Company while the third class or concentrating ore was left on the dump which now contains fully 15,000 tons available for reduction. The Liquidator is the extension of the Clark Colusa, which has lately become so prominent as a heavy contributor to the copper output of the camp, and is fully as extensive as that property. It is the intention of the company to concentrate the Liquidator ore from about 17 per cent, its average value, to 36 per cent, throwing about two tons into one. The concentrates will either be sold to the custom smelters or shipped East. The development of the mine will continue under the supervision of William McDermott, and the working force will be increased in a few days.

OREGON.

AT WORK.—*Jacksonville Times*, Aug. 12: Keaton, Klippel & Howard have completed the windmill in Applegate and are now at work in the bed of that stream. J. T. Layton is still engaged in cleaning up at his mines on Steamboat, though water is very scarce and progress necessarily slow. Prospectors are numerous throughout this section, and no doubt the finding of some valuable mines will be the result of their labors. W. J. Stanley of Woodville, came up yesterday and brought with him some quartz which is said to be rich in silver taken from a ledge which he has recently discovered.

UTAH.

PARK NOTES.—*Park Record*, Aug. 15: The Anchor Mining Company now have everything in readiness, and will begin sinking on Monday next. The Daly is steadily marching forward, improving at every step, and promises in time to successfully rival the Ontario. An election for a mining recorder for this district was held here on Tuesday last and the present incumbent, Pat Brennan, unanimously elected.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

Economy in Expense of Plant. Economy in Cost of Working. Economy in Saving Gold. Economy in Transportation of Machinery. Economy in Cost of Erection of Mill at Mine. Economy in Time Required to Establish Plant (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of continuous use at a number of mines in California has enabled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached THE ABSOLUTE in the construction of a perfect Quartz Mill.

GOLD QUARTZ and PLACER MINERS'

SILVER PLATED AMALGAMATING PLATES

FOR SAVING GOLD.

Have been Awarded the First Premium at Mechanics' Fair for the Last Thirteen Years.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 3,000 ORDERS FILLED!

References from every purchaser. Full weight of Silver guaranteed on every order.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought gold separated for low percentage of result.

JENKINS PATENT VALVES. Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be discarded and replaced by a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

THIS CUT REPRESENTS OUR

**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

HOSKIN & CO., Marysville, Cal.

DEWEY & CO.'S

Scientific Press

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING and REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER OF INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY OF CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FINE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Banker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.

Sole Manufacture, 327 First Street, SAN FRANCISCO, CAL.

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)

This form of Ore Feeder is well adapted for its peculiar work.

Manufacturers of the Celebrated "Challenge" Ore Feeders for any character of ore; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ore.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

Reasonable Mine Owners.

EDITORS PRESS:—The strictures in your last issue of your correspondent, "Experience," seem to me to be, in many respects, unfair and incorrect. His views must have been derived, not from contact with miners, but with those land-sharks known as "middlemen." He claims that miners ought not to ask so much for their mines, ought not to insist on cash, and ought to be content with "bonding" their claims, without any certainty of ever getting a cent for them.

As to asking too much, this is a matter of opinion. Every "prospect" has a speculative as well as an "intrinsic value," and the speculative value is that which always rules every market, in both personal and real property. To attempt to change this is simply absurd. As to cash payments the same business rule prevails in mining sales as in other cases. He that buys should pay cash down unless otherwise stipulated. If he has not got means, he has no business pretending to operate mines. As to the so-called "bonding" of mines, it has proved a delusion and a snare, that in most cases results in the mining claim being "gouged" by parties who content themselves with shallow work and pocket hunting—thus ruining the reputation of the mine and never fairly showing what it could do.

This style of "bonding" mines has proved, in most cases, a fraud on either the mine owner or the real purchaser. The person who takes the bond is generally some broken-down speculator, or self-styled expert. The price that he pretends to hold his "bond" for, is generally four times the actual contract price. If he forms a company to operate the mine, he makes them pay for it four times the price the mine owner gets. (My card will show you I ought to know what I am speaking about.) By a series of tricks the capitalists are humbugged by these middlemen, and the result is, the wrong impressions of mine owners, such as are set forth in the letter of "Experience."

The observations of "Experience," if made through the medium of these middlemen, or brokers, are correct, perhaps, if made from direct contact with mine owners, they are for the most part incorrect. Let those who desire to invest in mines deal directly with the mine owners. If so, they will find them very reasonable in price, easy in terms and honest and fair in their dealings. Such, at least in this Queen City of Quartz, is their general character.

Grass Valley, Aug. 15, 1885. INDEX.

Mining Share Market.

The crosscutting on the 520 level, west of the Sierra Nevada is a very interesting point for stock dealers to watch. Being in virgin ground, hitherto unexplored, with a long distance to run to find the west wall, and with all surface and other indications in favor of finding good ore deposits, speculative public attention is naturally drawn in that direction.

The Hale and Norcross deep winze still continues in ore and will soon be down to the 300 level, where it is to be connected with the Combination shaft by a drift, which will virtually and practically constitute the 300 level of the mine. The station set for it at the shaft is already in, and the station will be opened the first of next week, or as soon as the big pump gets into full substantial operation.

At the south or Gold Hill end very little ore is being produced, owing to the lack of milling facilities consequent upon the drying up of Carson river. The Brunswick mill, however, will start up with steam power on the first of next month, when ore production from the Yellow Jacket mine will be resumed under favorable auspices.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco.

PENN M. CO., August 19.—Location, Quijotoa, Arizona. Capital Stock, \$50,000,000. Directors—A. B. Hull, of Oakland, George H. Rice, George Phillips, Thomas Cole, L. M. Pearlman, of San Francisco.

LIVERMORE OIL CO., August 19.—Objects: To carry on all business, including buying and selling lands, prospecting and boring, laying pipe lines, etc., with headquarters at San Francisco. Capital Stock, \$1,000,000. Directors—B. J. Triest, John F. Mc. Gauby, Edward Klein, L. Matson and W. H. Hanage.

Bullion Shipments.

Banner district, Idaho, 14, \$7,916; Wild Deer, 12, \$3,290; Queen of the Hills, 11, \$4,600; Crescent, 12, \$4,000; Hueneme, 12, \$6,545; Germania, 12, \$9,253; 14, \$7,963; 13, \$6,326; Queen of the Hills, 13, \$3,500; Christy, 14, \$1,439; Germania, 14, \$3,034; 16, \$4,409; Ontario, 15, \$27,225; Stormont, 15, \$2,990; Crescent, 15, \$3,559; Queen of the Hills, 15, \$1,900; Germania, 17, \$4,934; Queen of the Hills, 16, \$1,800.

The banks of Salt Lake report the receipt for the week ending August 12th, inclusive, of \$46,290.48 in bullion and \$25,545 in ore, a total of \$71,835.48.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 262 Market St., S. F.]

FOR WEEK ENDING AUGUST 11, 1885.

- 324,004.—BILLIARD TABLE—E. Brunswick, S. F.
324,007.—BOILER TUBE EXPANDER—M. Cashin, S. F.
324,094.—VALVE GEAR—W. H. Donaldson, S. F.
324,096.—PISTON ROD PACKING—J. W. Dudley, Portland, Or.
324,022.—TAILORS' MEASURING DEVICE—J. S. Hand, S. F.
324,023.—HORSE COLLAR APPARATUS—Thos. Harris, Sacramento, Cal.
324,031.—COUPLING FOR CONNECTING PIPES—J. J. Lacey, S. F.
324,035.—CIGARETTE MACHINE—J. W. McCoy, S. F.
324,036.—FRUIT JAR—W. C. Moody, Oakland, Cal.
324,039.—NAPKIN SUPPORTER—W. C. Nelson, Santa Rosa, Cal.
323,961.—HEADER AND THRASHER—Thomas Powell, Stockton, Cal.
324,163.—PAINT BREMER—Thos. Poyser, S. F.
324,275.—FLAXSEED CLEANER—Thomas R. Rosier, San Jose, Cal.
324,284.—WINDMILL—R. F. Wilson, Stockton, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through DEWEY & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

NAPKIN SUPPORTER.—Wm. C. Nelson, Santa Rosa, No. 324,039. Dated, Aug. 11, 1885. This is a novel device for holding the napkin around the neck of the user; and it consists of an elastic wire having its central portion bent backward and forward upon itself into coils, while its ends are curved backward from these coils so as to be easily placed around the neck of the wearer to hold it up, while the napkin is held by the elasticity of the coils which are at the front.

APPARATUS FOR FORMING HORSE COLLARS.—Thos. Harris, Sacramento, assignor to A. A. Van Voorhis & Co., of same place. No. 324,023. Dated Aug. 11, 1885. The apparatus relates to that class of apparatus for forming horse collars, in which expanding and separable blocks or jaws receive and form the collar and hold it for the roping operation. The invention consists of a two-part expanding block or jaw for the top or neck of the collar, saddle-plates adapted to fit over the filling in plates, between the parts of the expanding blocks or jaws, both at the top and bottom of the collar, said saddle-plate being curved to continue the curvature of the periphery of blocks, adjustable washer-plates fitted in the sides of the dove-tailed slides or tracks, by which the blocks are steadiad and the wear taken up, and a scale to denote the sizes of the collars.

CIGARETTE MACHINE.—Juan W. McCoy, assignor to "Wood Tip Cigarette Co., of California." No. 324,035. Dated August 11, 1885. This invention relates to that class of machines for manufacturing cigarettes in which the finely cut tobacco is, by a succession of operations, first fed and distributed upon a continuous moving belt or former; secondly, compacted and formed into a continuous roll; thirdly, wrapped and inclosed in the envelope or strip of paper, the edges of which are then overlapped and secured by paste; and lastly, the continuous roll severed at intervals into cigarettes of the desired length. The improvements relate not only to the different parts of the machine by which these successive operations are accomplished, but also to the general arrangement of the parts composing the machine, resulting in a more compact and greatly improved machine for this purpose.

ELECTRO-MAGNETIC SPEED REGISTER FOR SHIPS' LOGS.—Bernard Faymonville, of S. F., Cal., No. 323,134. Dated July 28, 1885.—This invention consists of a peculiar speed register drawn through the water, a registering mechanism on the ship and an electric connection between them by which the movements of the former are recorded by the latter. The speed register in the water consists of an outer drum or cylinder having propeller-like wings, by which, on account of the forward movement through the water, the cylinder is rotated. Inside is an inner drum or cylinder, acting as a journal for the outer cylinder, and adapted to rotate upon a central axis. Gearing connects the two cylinders in such a manner that the inner one is driven by the outer one, but at a much less rate of speed. The cylinders and central axis are made of non-conducting material, but upon the inner cylinder is a metallic plate, which, at each revolution comes into contact with a metallic plate on the central axis. Insulated wires pass through the axis and connect with its metallic plate. The other or inboard ends of the wires are in a battery circuit including an electric magnet, which acts intermittently through an armature, as the circuit is opened and closed by the rotating inner drum, to operate a panel or ratchet mechanism which, through a system of gears and shafts operate the registering device on the ship.

COAL MINING BY ELECTRICITY.—An important and interesting experiment was recently carried on at Streator, Illinois. The object was to apply electricity as a motor in operating coal-cutting machinery, a branch of mechanics which has hitherto resisted the genius of inventors, and has only lately yielded to the extent of allowing machinery to be introduced at a very small margin of profit. This, as far as we know, is the first attempt in this direction, and, the mining engineers present at the experiment are reported to have been quite enthusiastic over the result, and to be sanguine of ultimate success. It is thought probable that in the near future an electric plant may be placed in the center of a section of land, and the coal under it be mined, conveyed to four hoisting shafts, hoisted to the surface, and the entire mine be lighted, all from the power furnished by the one central plant. The new mining machine does is cutting by a chisel shaped pick fastened at the end of a piston which is propelled by a direct and reciprocal motion from an electric current. Most electrical machines have hitherto been operated by rotary motion, and the establishment of a direct reciprocal motion is regarded as important on account of the great economy of power secured.—Iron.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively

Market Reports.

Lumber at Wholesale.

The Redwood Lumber Association has established no prices since the first of the year.
 Known as "Cargo" prices are at present as follows:
 Rough, merchantable, 2 M ft., \$13.00; Rough, clear and surfaced, \$23.00; 1x10 Rustic, No. 1, \$24.00; 1x10 Rustic, No. 2, \$19.00; 1x8 Rustic, No. 1, \$22.00; 1x8, tongued and grooved, \$21.00; 1x4, tongued and grooved, beaded, \$23.00; 1x3, Battens (board measure), \$30.00; Shingles, 2 M, \$1.05.

Plum—Rough, \$15.00; No. 2, \$12.00; do in lengths, \$13.00; rough, 40 to 50 ft lengths, \$18.00; do 50 to 60 ft, \$17.00; T and G Flooring, 1x6, \$26.00; do 1x8, \$25.00; do 1x10, \$24.00; do 1x12, \$23.00; No. 2, \$21.00; Vertical Grain T and G Flooring, 1x6, \$30.00; do 1x8, \$29.00; do 1x10, \$28.00; Stepping, \$37.50; Furring, 1x2, per lineal ft., 1 c.

Lumber at Retail.

Look for Your Subscription Credit.

Subscribers on paying for this paper should look at the date of the printed labels on their papers, and if the same is not credited, in due time, up to the date paid for, be sure to write us without delay. If an agent or clerk receiving the money should inadvertently or intentionally omit credit, it is important to the subscriber and ourselves that we be informed of it immediately, that we may act accordingly. Subscribers will please notify us of all errors which they may notice of any kind on our mail list. Be sure to write us if the paper comes after you wish it discontinued.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examination ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly experienced.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 252 Market Street. Elevator, 12 Front St., S. F.

BOOKS ON WORKING ORES.

BY GUIDO KUSTEL, M. E.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arc-furnaces, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.

This work is unequalled by any other published embracing the subjects treated. Its author is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ore and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50.

BOARDING OF GOLD AND SILVER ORES (Second Edition) and the EXTRACTION of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00, postage free.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.
